- [Including databases in replication](#)
- [Including tables in replication](#)
- [Including tables in replication with wildcard characters](#)
- [Escaping wildcard characters in names](#)
- [Excluding databases from replication](#)
- [Excluding tables from replication](#)
- [Excluding tables from replication using wildcard characters](#)

## Example Including databases in replication

The following example includes the `mydb1` and `mydb2` databases in replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-do-db", "ParameterValue": "mydb1,mydb2",
"ApplyMethod": "immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-do-db", "ParameterValue": "mydb1,mydb2",
"ApplyMethod": "immediate"}]"
```

## Example Including tables in replication

The following example includes the `table1` and `table2` tables in database `mydb1` in replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-do-table", "ParameterValue": "mydb1.table1,mydb1.table2",
"ApplyMethod": "immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-do-table", "ParameterValue": "mydb1.table1,mydb1.table2",
"ApplyMethod": "immediate"}]"
```

## Example Including tables in replication using wildcard characters

The following example includes tables with names that begin with `orders` and `returns` in database `mydb` in replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-wild-do-table", "ParameterValue": "mydb.orders%,mydb>Returns%",
"ApplyMethod": "immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
```

```
--parameters "[{"ParameterName": "replicate-wild-do-table", "ParameterValue": "mydb.orders%,mydb.returns%", "ApplyMethod":"immediate"}]"
```

### Example Escaping wildcard characters in names

The following example shows you how to use the escape character \ to escape a wildcard character that is part of a name.

Assume that you have several table names in database mydb1 that start with my\_table, and you want to include these tables in replication. The table names include an underscore, which is also a wildcard character, so the example escapes the underscore in the table names.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-wild-do-table", "ParameterValue": "my_\table%", "ApplyMethod":"immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-wild-do-table", "ParameterValue": "my_\table%", "ApplyMethod":"immediate"}]"
```

### Example Excluding databases from replication

The following example excludes the mydb1 and mydb2 databases from replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-ignore-db", "ParameterValue": "mydb1,mydb2", "ApplyMethod":"immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-ignore-db", "ParameterValue": "mydb1,mydb2", "ApplyMethod":"immediate"}]"
```

### Example Excluding tables from replication

The following example excludes tables table1 and table2 in database mydb1 from replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
```

```
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-ignore-table", "ParameterValue": "mydb1.table1,mydb1.table2", "ApplyMethod":"immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-ignore-table", "ParameterValue": "mydb1.table1,mydb1.table2", "ApplyMethod":"immediate"}]"
```

### Example Excluding tables from replication using wildcard characters

The following example excludes tables with names that begin with `orders` and `returns` in database `mydb` from replication.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name myparametergroup \
--parameters "[{"ParameterName": "replicate-wild-ignore-table", "ParameterValue": "mydb.orders%,mydb.returns%", "ApplyMethod":"immediate"}]"
```

For Windows:

```
aws rds modify-db-parameter-group ^
--db-parameter-group-name myparametergroup ^
--parameters "[{"ParameterName": "replicate-wild-ignore-table", "ParameterValue": "mydb.orders%,mydb.returns%", "ApplyMethod":"immediate"}]"
```

## Viewing the replication filters for a read replica

You can view the replication filters for a read replica in the following ways:

- Check the settings of the replication filtering parameters in the parameter group associated with the read replica.

For instructions, see [Viewing parameter values for a DB parameter group \(p. 240\)](#).

- In a MySQL client, connect to the read replica and run the `SHOW REPLICAS STATUS` statement.

In the output, the following fields show the replication filters for the read replica:

- `Replicate_Do_DB`
- `Replicate_Ignore_DB`
- `Replicate_Do_Table`
- `Replicate_Ignore_Table`
- `Replicate_Wild_Do_Table`
- `Replicate_Wild_Ignore_Table`

For more information about these fields, see [Checking Replication Status](#) in the MySQL documentation.

#### Note

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

## Configuring delayed replication with MySQL

You can use delayed replication as a strategy for disaster recovery. With delayed replication, you specify the minimum amount of time, in seconds, to delay replication from the source to the read replica. In the event of a disaster, such as a table deleted unintentionally, you complete the following steps to recover from the disaster quickly:

- Stop replication to the read replica before the change that caused the disaster is sent to it.  
Use the [mysql.rds\\_stop\\_replication \(p. 977\)](#) stored procedure to stop replication.
- Start replication and specify that replication stops automatically at a log file location.  
You specify a location just before the disaster using the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure.
- Promote the read replica to be the new source DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

### Note

- On Amazon RDS for MySQL 5.7, delayed replication is supported for MySQL 5.7.22 and later. On Amazon RDS for MySQL 5.6, delayed replication is supported for MySQL 5.6.40 and later. Delayed replication is not supported on Amazon RDS for MySQL 8.0.
- Use stored procedures to configure delayed replication. You can't configure delayed replication with the AWS Management Console, the AWS CLI, or the Amazon RDS API.
- On Amazon RDS for MySQL 5.7.23 and later MySQL 5.7 versions, you can use replication based on global transaction identifiers (GTIDs) in a delayed replication configuration. If you use GTID-based replication, use the [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure instead of the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure. For more information about GTID-based replication, see [Using GTID-based replication for RDS for MySQL \(p. 919\)](#).

### Topics

- [Configuring delayed replication during read replica creation \(p. 915\)](#)
- [Modifying delayed replication for an existing read replica \(p. 916\)](#)
- [Setting a location to stop replication to a read replica \(p. 916\)](#)

## Configuring delayed replication during read replica creation

To configure delayed replication for any future read replica created from a DB instance, run the [mysql.rds\\_set\\_configuration \(p. 982\)](#) stored procedure with the `target_delay` parameter.

### To configure delayed replication during read replica creation

1. Using a MySQL client, connect to the MySQL DB instance to be the source for read replicas as the master user.
2. Run the [mysql.rds\\_set\\_configuration \(p. 982\)](#) stored procedure with the `target_delay` parameter.

For example, run the following stored procedure to specify that replication is delayed by at least one hour (3,600 seconds) for any read replica created from the current DB instance.

```
call mysql.rds_set_configuration('target_delay', 3600);
```

**Note**

After running this stored procedure, any read replica you create using the AWS CLI or Amazon RDS API is configured with replication delayed by the specified number of seconds.

## Modifying delayed replication for an existing read replica

To modify delayed replication for an existing read replica, run the [mysql.rds\\_set\\_source\\_delay \(p. 974\)](#) stored procedure.

### To modify delayed replication for an existing read replica

1. Using a MySQL client, connect to the read replica as the master user.
2. Use the [mysql.rds\\_stop\\_replication \(p. 977\)](#) stored procedure to stop replication.
3. Run the [mysql.rds\\_set\\_source\\_delay \(p. 974\)](#) stored procedure.

For example, run the following stored procedure to specify that replication to the read replica is delayed by at least one hour (3600 seconds).

```
call mysql.rds_set_source_delay(3600);
```

4. Use the [mysql.rds\\_start\\_replication \(p. 974\)](#) stored procedure to start replication.

## Setting a location to stop replication to a read replica

After stopping replication to the read replica, you can start replication and then stop it at a specified binary log file location using the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure.

### To start replication to a read replica and stop replication at a specific location

1. Using a MySQL client, connect to the source MySQL DB instance as the master user.
2. Run the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure.

The following example initiates replication and replicates changes until it reaches location 120 in the `mysql-bin-changelog.000777` binary log file. In a disaster recovery scenario, assume that location 120 is just before the disaster.

```
call mysql.rds_start_replication_until(
 'mysql-bin-changelog.000777',
 120);
```

Replication stops automatically when the stop point is reached. The following RDS event is generated: `Replication has been stopped since the replica reached the stop point specified by the rds_start_replication_until stored procedure.`

After replication is stopped, in a disaster recovery scenario, you can [Promoting a read replica to be a standalone DB instance \(p. 286\)](#) promote the read replica to be the new source DB instance. For information about promoting the read replica, see [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

## Read replica updates with MySQL

Read replicas are designed to support read queries, but you might need occasional updates. For example, you might need to add an index to optimize the specific types of queries accessing the replica. You can enable updates by setting the `read_only` parameter to 0 in the DB parameter group for the read

replica. Be careful when disabling read-only on a read replica because it can cause problems if the read replica becomes incompatible with the source DB instance. Change the value of the `read_only` parameter back to 1 as soon as possible.

## Multi-AZ read replica deployments with MySQL

You can create a read replica from either single-AZ or Multi-AZ DB instance deployments. You use Multi-AZ deployments to improve the durability and availability of critical data, but you can't use the Multi-AZ secondary to serve read-only queries. Instead, you can create read replicas from high-traffic Multi-AZ DB instances to offload read-only queries. If the source instance of a Multi-AZ deployment fails over to the secondary, any associated read replicas automatically switch to use the secondary (now primary) as their replication source. For more information, see [High availability \(Multi-AZ\) for Amazon RDS \(p. 52\)](#).

You can create a read replica as a Multi-AZ DB instance. Amazon RDS creates a standby of your replica in another Availability Zone for failover support for the replica. Creating your read replica as a Multi-AZ DB instance is independent of whether the source database is a Multi-AZ DB instance.

**Note**

To create a read replica as a Multi-AZ DB instance, the DB instance must be MySQL 5.6 or later.

## Monitoring MySQL read replicas

For MySQL read replicas, you can monitor replication lag in Amazon CloudWatch by viewing the Amazon RDS `ReplicaLag` metric. The `ReplicaLag` metric reports the value of the `Seconds_Behind_Master` field of the `SHOW REPLICAS STATUS` command.

**Note**

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

Common causes for replication lag for MySQL are the following:

- A network outage.
- Writing to tables that have different indexes on a read replica. If the `read_only` parameter is set to 0 on the read replica, replication can break if the read replica becomes incompatible with the source DB instance. After you've performed maintenance tasks on the read replica, we recommend that you set the `read_only` parameter back to 1.
- Using a nontransactional storage engine such as MyISAM. Replication is only supported for the InnoDB storage engine on MySQL.

When the `ReplicaLag` metric reaches 0, the replica has caught up to the source DB instance. If the `ReplicaLag` metric returns -1, then replication is currently not active. `ReplicaLag = -1` is equivalent to `Seconds_Behind_Master = NULL`.

## Starting and stopping replication with MySQL read replicas

You can stop and restart the replication process on an Amazon RDS DB instance by calling the system stored procedures [mysql.rds\\_stop\\_replication \(p. 977\)](#) and [mysql.rds\\_start\\_replication \(p. 974\)](#). You can do this when replicating between two Amazon RDS instances for long-running operations such as creating large indexes. You also need to stop and start replication when importing or exporting databases. For more information, see [Importing data to an Amazon RDS MySQL or MariaDB DB instance with reduced downtime \(p. 890\)](#) and [Exporting data from a MySQL DB instance by using replication \(p. 930\)](#).

If replication is stopped for more than 30 consecutive days, either manually or due to a replication error, Amazon RDS terminates replication between the source DB instance and all read replicas. It does so to prevent increased storage requirements on the source DB instance and long failover times. The read replica DB instance is still available. However, replication can't be resumed because the binary logs

required by the read replica are deleted from the source DB instance after replication is terminated. You can create a new read replica for the source DB instance to reestablish replication.

## Troubleshooting a MySQL read replica problem

For MySQL DB instances, in some cases read replicas present replication errors or data inconsistencies between the read replica and its source DB instance. This problem occurs when some binary log (binlog) events or InnoDB redo logs aren't flushed during a failure of the read replica or the source DB instance. In these cases, manually delete and recreate the read replicas. You can reduce the chance of this happening by setting the following parameter values: `sync_binlog=1` and `innodb_flush_log_at_trx_commit=1`. These settings might reduce performance, so test their impact before implementing the changes in a production environment. For MySQL 5.5, `sync_binlog` defaults to 0, but in MySQL 5.6 and later, problems are less likely to occur because these parameters are all set to the recommended values by default.

The replication technologies for MySQL are asynchronous. Because they are asynchronous, occasional `BinLogDiskUsage` increases on the source DB instance and `ReplicaLag` on the read replica are to be expected. For example, a high volume of write operations to the source DB instance can occur in parallel. In contrast, write operations to the read replica are serialized using a single I/O thread, which can lead to a lag between the source instance and read replica. For more information about read-only replicas in the MySQL documentation, see [Replication implementation details](#).

You can do several things to reduce the lag between updates to a source DB instance and the subsequent updates to the read replica, such as the following:

- Sizing a read replica to have a storage size and DB instance class comparable to the source DB instance.
- Ensuring that parameter settings in the DB parameter groups used by the source DB instance and the read replica are compatible. For more information and an example, see the discussion of the `max_allowed_packet` parameter later in this section.

Amazon RDS monitors the replication status of your read replicas and updates the `Replication State` field of the read replica instance to `Error` if replication stops for any reason. An example might be if DML queries run on your read replica conflict with the updates made on the source DB instance.

You can review the details of the associated error thrown by the MySQL engine by viewing the `Replication Error` field. Events that indicate the status of the read replica are also generated, including [RDS-EVENT-0045 \(p. 509\)](#), [RDS-EVENT-0046 \(p. 509\)](#), and [RDS-EVENT-0047 \(p. 508\)](#). For more information about events and subscribing to events, see [Using Amazon RDS event notification \(p. 504\)](#). If a MySQL error message is returned, review the error number in the [MySQL error message documentation](#).

One common issue that can cause replication errors is when the value for the `max_allowed_packet` parameter for a read replica is less than the `max_allowed_packet` parameter for the source DB instance. The `max_allowed_packet` parameter is a custom parameter that you can set in a DB parameter group. You use `max_allowed_packet` to specify the maximum size of DML code that can be run on the database. In some cases, the `max_allowed_packet` value in the DB parameter group associated with a read replica is smaller than the `max_allowed_packet` value in the DB parameter group associated with the source DB instance. In these cases, the replication process can throw the error `Packet bigger than 'max_allowed_packet' bytes` and stop replication. To fix the error, have the source DB instance and read replica use DB parameter groups with the same `max_allowed_packet` parameter values.

Other common situations that can cause replication errors include the following:

- Writing to tables on a read replica. In some cases, you might create indexes on a read replica that are different from the indexes on the source DB instance. If you do, set the `read_only` parameter to 0

to create the indexes. If you write to tables on the read replica, it might break replication if the read replica becomes incompatible with the source DB instance. After you perform maintenance tasks on the read replica, we recommend that you set the `read_only` parameter back to 1.

- Using a non-transactional storage engine such as MyISAM. Read replicas require a transactional storage engine. Replication is only supported for the InnoDB storage engine on MySQL.
- Using unsafe nondeterministic queries such as `SYSDATE()`. For more information, see [Determination of safe and unsafe statements in binary logging](#).

If you decide that you can safely skip an error, you can follow the steps described in the section [Skipping the current replication error \(p. 943\)](#). Otherwise, you can first delete the read replica. Then you create an instance using the same DB instance identifier so that the endpoint remains the same as that of your old read replica. If a replication error is fixed, the `Replication State` changes to `replicating`.

## Using GTID-based replication for RDS for MySQL

Following, you can learn how to use global transaction identifiers (GTIDs) with binary log (binlog) replication among RDS for MySQL DB instances.

If you use binlog replication and aren't familiar with GTID-based replication with MySQL, see [Replication with global transaction identifiers](#) in the MySQL documentation for background.

### Note

GTID-based replication is supported for RDS for MySQL version 5.7.23 and later MySQL 5.7 versions. All MySQL DB instances in a replication configuration must meet this requirement. GTID-based replication isn't supported for RDS for MySQL 5.5, 5.6, or 8.0.

### Topics

- [Overview of global transaction identifiers \(GTIDs\) \(p. 919\)](#)
- [Parameters for GTID-based replication \(p. 920\)](#)
- [Configuring GTID-based replication for new read replicas \(p. 921\)](#)
- [Configuring GTID-based replication for existing read replicas \(p. 921\)](#)
- [Disabling GTID-based replication for a MySQL DB instance with read replicas \(p. 922\)](#)

### Note

For information about configuring GTID-based replication with an external database, see [Replication with a MySQL or MariaDB instance running external to Amazon RDS \(p. 924\)](#).

## Overview of global transaction identifiers (GTIDs)

*Global transaction identifiers (GTIDs)* are unique identifiers generated for committed MySQL transactions. You can use GTIDs to make binlog replication simpler and easier to troubleshoot.

MySQL uses two different types of transactions for binlog replication:

- *GTID transactions* – Transactions that are identified by a GTID.
- *Anonymous transactions* – Transactions that don't have a GTID assigned.

In a replication configuration, GTIDs are unique across all DB instances. GTIDs simplify replication configuration because when you use them, you don't have to refer to log file positions. GTIDs also make it easier to track replicated transactions and determine whether the source instance and replicas are consistent.

You can use GTID-based replication to replicate data with Amazon RDS MySQL read replicas or with an external MySQL database. For RDS for MySQL read replicas, you can configure GTID-based replication

when you are creating new read replicas, or you can convert existing read replicas to use GTID-based replication.

You can also use GTID-based replication in a delayed replication configuration with RDS for MySQL . For more information, see [Configuring delayed replication with MySQL \(p. 915\)](#).

## Parameters for GTID-based replication

Use the following parameters to configure GTID-based replication.

Parameter	Valid values	Description
gtid_mode	OFF, OFF_PERMISSIVE, ON_PERMISSIVE, ON	<p>OFF specifies that new transactions are anonymous transactions (that is, don't have GTIDs), and a transaction must be anonymous to be replicated.</p> <p>OFF_PERMISSIVE specifies that new transactions are anonymous transactions, but all transactions can be replicated.</p> <p>ON_PERMISSIVE specifies that new transactions are GTID transactions, but all transactions can be replicated.</p> <p>ON specifies that new transactions are GTID transactions, and a transaction must be a GTID transaction to be replicated.</p>
enforce_gtid_consistency	OFF, ON, WARN	<p>OFF allows transactions to violate GTID consistency.</p> <p>ON prevents transactions from violating GTID consistency.</p> <p>WARN allows transactions to violate GTID consistency but generates a warning when a violation occurs.</p>

### Note

In the AWS Management Console, the `gtid_mode` parameter appears as `gtid-mode`.

For GTID-based replication, use these settings for the parameter group for your DB instance or read replica:

- **ON** and **ON\_PERMISSIVE** apply only to outgoing replication from an RDS DB instance or Aurora MySQL cluster. Both of these values cause your RDS DB instance or Aurora DB cluster to use GTIDs for transactions that are replicated to an external database. **ON** requires that the external database also use GTID-based replication. **ON\_PERMISSIVE** makes GTID-based replication optional on the external database.
- **OFF\_PERMISSIVE**, if set, means that your RDS DB instances or Aurora DB cluster can accept incoming replication from an external database. It can do this whether the external database uses GTID-based replication or not.
- **OFF**, if set, means that your RDS DB instances or Aurora DB cluster only accept incoming replication from external databases that don't use GTID-based replication.

For more information about parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

## Configuring GTID-based replication for new read replicas

When GTID-based replication is enabled for an RDS for MySQL DB instance, GTID-based replication is configured automatically for read replicas of the DB instance.

### To enable GTID-based replication for new read replicas

1. Make sure that the parameter group associated with the DB instance has the following parameter settings:

- `gtid_mode` – ON or ON\_PERMISSIVE
- `enforce_gtid_consistency` – ON

For more information about setting configuration parameters using parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

2. If you changed the parameter group of the DB instance, reboot the DB instance. For more information on how to do so, see [Rebooting a DB instance \(p. 277\)](#).
3. Create one or more read replicas of the DB instance. For more information on how to do so, see [Creating a read replica \(p. 284\)](#).

Amazon RDS attempts to establish GTID-based replication between the MySQL DB instance and the read replicas using the `MASTER_AUTO_POSITION`. If the attempt fails, Amazon RDS uses log file positions for replication with the read replicas. For more information about the `MASTER_AUTO_POSITION`, see [GTID auto-positioning](#) in the MySQL documentation.

## Configuring GTID-based replication for existing read replicas

For an existing MySQL DB instance with read replicas that doesn't use GTID-based replication, you can configure GTID-based replication between the DB instance and the read replicas.

### To enable GTID-based replication for existing read replicas

1. If the DB instance or any read replica is using RDS for MySQL version 5.7.22 or lower, upgrade the DB instance or read replica. Upgrade to RDS for MySQL version 5.7.23 or a later MySQL 5.7 version.

For more information, see [Upgrading the MySQL DB engine \(p. 862\)](#).

2. (Optional) Reset the GTID parameters and test the behavior of the DB instance and read replicas:

- a. Make sure that the parameter group associated with the DB instance and each read replica has the `enforce_gtid_consistency` parameter set to `WARN`.

For more information about setting configuration parameters using parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

- b. If you changed the parameter group of the DB instance, reboot the DB instance. If you changed the parameter group for a read replica, reboot the read replica.

For more information, see [Rebooting a DB instance \(p. 277\)](#).

- c. Run your DB instance and read replicas with your normal workload and monitor the log files.

If you see warnings about GTID-incompatible transactions, adjust your application so that it only uses GTID-compatible features. Make sure that the DB instance is not generating any warnings about GTID-incompatible transactions before proceeding to the next step.

3. Reset the GTID parameters for GTID-based replication that allows anonymous transactions until the read replicas have processed all of them.

- a. Make sure that the parameter group associated with the DB instance and each read replica has the following parameter settings:
    - `gtid_mode` – `ON_PERMISSIVE`
    - `enforce_gtid_consistency` – `ON`
  - b. If you changed the parameter group of the DB instance, reboot the DB instance. If you changed the parameter group for a read replica, reboot the read replica.
4. Wait for all of your anonymous transactions to be replicated. To check that these are replicated, do the following:
- a. Run the following statement on your source DB instance.

```
SHOW MASTER STATUS;
```

Note the values in the `File` and `Position` columns.

- b. On each read replica, use the file and position information from its source instance in the previous step to run the following query.

```
SELECT MASTER_POS_WAIT('file', position);
```

For example, if the file name is `mysql-bin-changelog.000031` and the position is 107, run the following statement.

```
SELECT MASTER_POS_WAIT('mysql-bin-changelog.000031', 107);
```

If the read replica is past the specified position, the query returns immediately. Otherwise, the function waits. Proceed to the next step when the query returns for all read replicas.

5. Reset the GTID parameters for GTID-based replication only.
  - a. Make sure that the parameter group associated with the DB instance and each read replica has the following parameter settings:
    - `gtid_mode` – `ON`
    - `enforce_gtid_consistency` – `ON`
  - b. Reboot the DB instance and each read replica.
6. On each read replica, run the following procedure.

```
CALL mysql.rds_set_master_auto_position(1);
```

## Disabling GTID-based replication for a MySQL DB instance with read replicas

You can disable GTID-based replication for a MySQL DB instance with read replicas.

### To disable GTID-based replication for a MySQL DB instance with read replicas

1. On each read replica, run the following procedure.

```
CALL mysql.rds_set_master_auto_position(0);
```

2. Reset the `gtid_mode` to `ON_PERMISSIVE`.

- a. Make sure that the parameter group associated with the MySQL DB instance and each read replica has `gtid_mode` set to `ON_PERMISSIVE`.

For more information about setting configuration parameters using parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

- b. Reboot the MySQL DB instance and each read replica. For more information about rebooting, see [Rebooting a DB instance \(p. 277\)](#).

3. Reset the `gtid_mode` to `OFF_PERMISSIVE`:

- a. Make sure that the parameter group associated with the MySQL DB instance and each read replica has `gtid_mode` set to `OFF_PERMISSIVE`.

- b. Reboot the MySQL DB instance and each read replica.

4. Wait for all of the GTID transactions to be applied on all of the read replicas. To check that these are applied, do the following:

Wait for all of the GTID transactions to be applied on the Aurora primary instance. To check that these are applied, do the following:

- a. On the MySQL DB instance, run the `SHOW MASTER STATUS` command.

Your output should be similar to the following.

File	Position
mysql-bin-changelog.000031	107

Note the file and position in your output.

- b. On each read replica, use the file and position information from its source instance in the previous step to run the following query.

```
SELECT MASTER_POS_WAIT('file', position);
```

For example, if the file name is `mysql-bin-changelog.000031` and the position is `107`, run the following statement.

```
SELECT MASTER_POS_WAIT('mysql-bin-changelog.000031', 107);
```

If the read replica is past the specified position, the query returns immediately. Otherwise, the function waits. When the query returns for all read replicas, go to the next step.

5. Reset the GTID parameters to disable GTID-based replication:

- a. Make sure that the parameter group associated with the MySQL DB instance and each read replica has the following parameter settings:

- `gtid_mode` – OFF
- `enforce_gtid_consistency` – OFF

- b. Reboot the MySQL DB instance and each read replica.

# Replication with a MySQL or MariaDB instance running external to Amazon RDS

You can set up replication between an Amazon RDS for MySQL or MariaDB DB instance and a MySQL or MariaDB instance that is external to Amazon RDS.

## Topics

- [Before you begin \(p. 924\)](#)
- [Configuring binary log file position replication with an external source instance \(p. 924\)](#)
- [Configuring GTID-based replication with an external source instance \(p. 927\)](#)

## Before you begin

You can configure replication using the binary log file position of replicated transactions. On Amazon RDS MySQL 5.7.23 and later MySQL 5.7 versions, you can also configure replication using global transaction identifiers (GTIDs).

The permissions required to start replication on an Amazon RDS DB instance are restricted and not available to your Amazon RDS master user. Because of this, make sure that you use the Amazon RDS [mysql.rds\\_set\\_external\\_master \(p. 964\)](#) and [mysql.rds\\_start\\_replication \(p. 974\)](#) commands to set up replication between your live database and your Amazon RDS database.

To set the binary logging format for a MySQL or MariaDB database, update the `binlog_format` parameter. If your DB instance uses the default DB instance parameter group, create a new DB parameter group to modify `binlog_format` settings. We recommend that you use the default setting for `binlog_format`, which is `MIXED`. However, you can also set `binlog_format` to `ROW` or `STATEMENT` if you need a specific binlog format. Reboot your DB instance for the change to take effect.

For information about setting the `binlog_format` parameter, see [Setting the binary logging format \(p. 547\)](#). For information about the implications of different MySQL replication types, see [Advantages and disadvantages of statement-based and row-based replication](#) in the MySQL documentation.

### Note

Use the procedure in this topic to configure replication in all cases except when the external instance is MariaDB version 10.0.2 or greater and the Amazon RDS instance is MariaDB. In that case, use the procedure at [Configuring GTID-based replication into a MariaDB DB instance \(p. 620\)](#) to set up GTID-based replication.

## Configuring binary log file position replication with an external source instance

Follow these guidelines when you set up an external source instance and a replica on Amazon RDS:

- Monitor failover events for the Amazon RDS DB instance that is your replica. If a failover occurs, then the DB instance that is your replica might be recreated on a new host with a different network address. For information on how to monitor failover events, see [Using Amazon RDS event notification \(p. 504\)](#).
- Maintain the binary logs (binlogs) on your source instance until you have verified that they have been applied to the replica. This maintenance makes sure that you can restore your source instance in the event of a failure.
- Turn on automated backups on your Amazon RDS DB instance. Turning on automated backups makes sure that you can restore your replica to a particular point in time if you need to re-synchronize your source instance and replica. For information on backups and point-in-time restore, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

## To configure binary log file replication with an external source instance

1. Make the source MySQL or MariaDB instance read-only.

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SET GLOBAL read_only = ON;
```

2. Run the SHOW MASTER STATUS command on the source MySQL or MariaDB instance to determine the binlog location.

You receive output similar to the following example.

File	Position
mysql-bin-changelog.000031	107

3. Copy the database from the external instance to the Amazon RDS DB instance using mysqldump. For very large databases, you might want to use the procedure in [Importing data to an Amazon RDS MySQL or MariaDB DB instance with reduced downtime \(p. 890\)](#).

For Linux, macOS, or Unix:

```
mysqldump --databases database_name \
--single-transaction \
--compress \
--order-by-primary \
-u local_user \
-plocal_password | mysql \
--host=hostname \
--port=3306 \
-u RDS_user_name \
-pRDS_password
```

For Windows:

```
mysqldump --databases database_name ^
--single-transaction ^
--compress ^
--order-by-primary ^
-u local_user ^
-plocal_password | mysql ^
--host=hostname ^
--port=3306 ^
-u RDS_user_name ^
-pRDS_password
```

### Note

Make sure that there isn't a space between the `-p` option and the entered password.

To specify the host name, user name, port, and password to connect to your Amazon RDS DB instance, use the `--host`, `--user` (`-u`), `--port` and `-p` options in the `mysql` command. The host name is the Domain Name Service (DNS) name from the Amazon RDS DB instance endpoint, for example, `myinstance.123456789012.us-east-1.rds.amazonaws.com`. You can find the endpoint value in the instance details in the AWS Management Console.

4. Make the source MySQL or MariaDB instance writeable again.

```
mysql> SET GLOBAL read_only = OFF;
```

```
mysql> UNLOCK TABLES;
```

For more information on making backups for use with replication, see [the MySQL documentation](#).

5. In the AWS Management Console, add the IP address of the server that hosts the external database to the VPC security group for the Amazon RDS DB instance. For more information on modifying a VPC security group, see [Security groups for your VPC](#) in the *Amazon Virtual Private Cloud User Guide*.

The IP address can change when the following conditions are met:

- You are using a public IP address for communication between the external source instance and the DB instance.
- The external source instance was stopped and restarted.

If these conditions are met, verify the IP address before adding it.

You might also need to configure your local network to permit connections from the IP address of your Amazon RDS DB instance. You do this so that your local network can communicate with your external MySQL or MariaDB instance. To find the IP address of the Amazon RDS DB instance, use the `host` command.

```
host db_instance_endpoint
```

The host name is the DNS name from the Amazon RDS DB instance endpoint.

6. Using the client of your choice, connect to the external instance and create a user to use for replication. Use this account solely for replication. and restrict it to your domain to improve security. The following is an example.

#### MySQL 5.5, 5.6, and 5.7

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED BY 'password';
```

#### MySQL 8.0

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED WITH mysql_native_password BY
'password';
```

7. For the external instance, grant `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges to your replication user. For example, to grant the `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges on all databases for the '`repl_user`' user for your domain, issue the following command.

#### MySQL 5.5, 5.6, and 5.7

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com'
IDENTIFIED BY 'password';
```

#### MySQL 8.0

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com';
```

8. Make the Amazon RDS DB instance the replica. To do so, first connect to the Amazon RDS DB instance as the master user. Then identify the external MySQL or MariaDB database as the source instance by using the [mysql.rds\\_set\\_external\\_master](#) (p. 964) command. Use the master log file name and master log position that you determined in step 2. The following is an example.

```
CALL mysql.rds_set_external_master ('mymasterserver.mydomain.com', 3306, 'repl_user',
'password', 'mysql-bin-changelog.000031', 107, 0);
```

**Note**

On Amazon RDS for MySQL, you can choose to use delayed replication by running the [mysql.rds\\_set\\_external\\_master\\_with\\_delay \(p. 966\)](#) stored procedure instead. One reason to use delayed replication is to enable disaster recovery with the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure. Currently, delayed replication is not supported on RDS for MariaDB.

9. On the Amazon RDS DB instance, issue the [mysql.rds\\_start\\_replication \(p. 974\)](#) command to start replication:

```
CALL mysql.rds_start_replication;
```

## Configuring GTID-based replication with an external source instance

When you set up an external source instance and a replica on Amazon RDS, monitor failover events for the Amazon RDS DB instance that is your replica. If a failover occurs, then the DB instance that is your replica might be recreated on a new host with a different network address. For information on how to monitor failover events, see [Using Amazon RDS event notification \(p. 504\)](#).

**Important**

GTID-based replication is only supported on Amazon RDS for MySQL version 5.7.23 and later MySQL 5.7 versions. GTID-based replication is not supported for Amazon RDS for MySQL 5.5, 5.6, or 8.0.

### To configure GTID-based replication with an external source instance

1. Prepare for GTID-based replication:

- a. Make sure that the external MySQL or MariaDB database has GTID-based replication enabled. To do so, make sure that the external database has the following parameters set to the specified values:

```
gtid_mode - ON
enforce_gtid_consistency - ON
```

For more information, see [Replication with global transaction identifiers](#) in the MySQL documentation or [Global transaction ID](#) in the MariaDB documentation.

- b. Make sure that the parameter group associated with the DB instance has the following parameter settings:

- `gtid_mode - ON, ON_PERMISSIVE, or OFF_PERMISSIVE`
- `enforce_gtid_consistency - ON`

For more information about parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

- c. If you changed the parameter group of the DB instance, reboot the DB instance. For more information, see [Rebooting a DB instance \(p. 277\)](#).

2. Make the source MySQL or MariaDB instance read-only.

```
mysql> FLUSH TABLES WITH READ LOCK;
```

```
mysql> SET GLOBAL read_only = ON;
```

3. Copy the database from the external instance to the Amazon RDS DB instance using `mysqldump`. For very large databases, you might want to use the procedure in [Importing data to an Amazon RDS MySQL or MariaDB DB instance with reduced downtime \(p. 890\)](#).

For Linux, macOS, or Unix:

```
mysqldump --databases database_name \
 --single-transaction \
 --compress \
 --order-by-primary \
 -u local_user \
 -plocal_password | mysql \
 --host=hostname \
 --port=3306 \
 -u RDS_user_name \
 -pRDS_password
```

For Windows:

```
mysqldump --databases database_name ^
 --single-transaction ^
 --compress ^
 --order-by-primary ^
 -u local_user ^
 -plocal_password | mysql ^
 --host=hostname ^
 --port=3306 ^
 -u RDS_user_name ^
 -pRDS_password
```

**Note**

Make sure that there is not a space between the `-p` option and the entered password.

To specify the host name, user name, port, and password to connect to your Amazon RDS DB instance, use the `--host`, `--user` (`-u`), `--port` and `-p` options in the `mysql` command. The host name is the DNS name from the Amazon RDS DB instance endpoint, for example, `myinstance.123456789012.us-east-1.rds.amazonaws.com`. You can find the endpoint value in the instance details in the AWS Management Console.

4. Make the source MySQL or MariaDB instance writeable again.

```
mysql> SET GLOBAL read_only = OFF;
mysql> UNLOCK TABLES;
```

For more information on making backups for use with replication, see [the MySQL documentation](#).

5. In the AWS Management Console, add the IP address of the server that hosts the external database to the VPC security group for the Amazon RDS DB instance. For more information on modifying a VPC security group, see [Security groups for your VPC](#) in the *Amazon Virtual Private Cloud User Guide*.

The IP address can change when the following conditions are met:

- You are using a public IP address for communication between the external source instance and the DB instance.
- The external source instance was stopped and restarted.

If these conditions are met, verify the IP address before adding it.

You might also need to configure your local network to permit connections from the IP address of your Amazon RDS DB instance. You do this so that your local network can communicate with your external MySQL or MariaDB instance. To find the IP address of the Amazon RDS DB instance, use the host command.

```
host db_instance_endpoint
```

The host name is the DNS name from the Amazon RDS DB instance endpoint.

6. Using the client of your choice, connect to the external instance and create a user to use for replication. Use this account solely for replication. and restrict it to your domain to improve security. The following is an example.

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED BY 'password';
```

7. For the external instance, grant REPLICATION CLIENT and REPLICATION SLAVE privileges to your replication user. For example, to grant the REPLICATION CLIENT and REPLICATION SLAVE privileges on all databases for the 'repl\_user' user for your domain, issue the following command.

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com'
IDENTIFIED BY 'password';
```

8. Make the Amazon RDS DB instance the replica. To do so, first connect to the Amazon RDS DB instance as the master user. Then identify the external MySQL or MariaDB database as the replication primary instance by using the [mysql.rds\\_set\\_external\\_master\\_with\\_auto\\_position \(p. 969\)](#) command. The following is an example.

```
CALL mysql.rds_set_external_master_with_auto_position ('mymasterserver.mydomain.com',
3306, 'repl_user', 'password', 0, 0);
```

#### Note

On Amazon RDS for MySQL, you can choose to use delayed replication by running the [mysql.rds\\_set\\_external\\_master\\_with\\_delay \(p. 966\)](#) stored procedure instead.

One reason to use delayed replication is to enable disaster recovery with the [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure. Currently, delayed replication is not supported on RDS for MariaDB.

9. On the Amazon RDS DB instance, issue the [mysql.rds\\_start\\_replication \(p. 974\)](#) command to start replication.

```
CALL mysql.rds_start_replication;
```

# Exporting data from a MySQL DB instance by using replication

To export data from a MySQL 5.6 or later DB instance to a MySQL instance running external to Amazon RDS, you can use replication. In this scenario, the MySQL DB instance is the *source MySQL DB instance*, and the MySQL instance running external to Amazon RDS is the *external MySQL database*.

The source MySQL DB instance must be running version 5.6.13 or later. The external MySQL database can run either on-premises in your data center, or on an Amazon EC2 instance. The external MySQL database must run the same version as the source MySQL DB instance, or a later version.

Replication to an external MySQL database is only supported during the time it takes to export a database from the source MySQL DB instance. The replication should be terminated when the data has been exported and applications can start accessing the external MySQL instance.

The following list shows the steps to take. Each step is discussed in more detail in later sections.

1. Prepare an external MySQL DB instance.
2. Prepare the source MySQL DB instance for replication.
3. Use the mysqldump utility to transfer the database from the source MySQL DB instance to the external MySQL database.
4. Start replication to the external MySQL database.
5. After the export completes, stop replication.

## Prepare an external MySQL database

Perform the following steps to prepare the external MySQL database.

### To prepare the external MySQL database

1. Install the external MySQL database.
2. Connect to the external MySQL database as the master user. Then create the users required to support the administrators, applications, and services that access the database.
3. Follow the directions in the MySQL documentation to prepare the external MySQL database as a replica. For more information, see [the MySQL documentation](#).
4. Configure an egress rule for the external MySQL database to operate as a read replica during the export. The egress rule allows the external MySQL database to connect to the source MySQL DB instance during replication. Specify an egress rule that allows Transmission Control Protocol (TCP) connections to the port and IP address of the source MySQL DB instance.

Specify the appropriate egress rules for your environment:

- If the external MySQL database is running in an Amazon EC2 instance in a virtual private cloud (VPC) based on the Amazon VPC service, specify the egress rules in a VPC security group. For more information, see [Controlling access with security groups \(p. 1737\)](#).
  - If the external MySQL database is running in an Amazon EC2 instance that is not in a VPC, specify the egress rules in an EC2-Classic security group.
  - If the external MySQL database is installed on-premises, specify the egress rules in a firewall.
5. If the external MySQL database is running in a VPC, configure rules for the VPC access control list (ACL) rules in addition to the security group egress rule:

- Configure an ACL ingress rule allowing TCP traffic to ports 1024–65535 from the IP address of the source MySQL DB instance.
- Configure an ACL egress rule allowing outbound TCP traffic to the port and IP address of the source MySQL DB instance.

For more information about Amazon VPC network ACLs, see [Network ACLs](#) in *Amazon VPC User Guide*.

6. (Optional) Set the `max_allowed_packet` parameter to the maximum size to avoid replication errors. We recommend this setting.

## Prepare the source MySQL DB instance

Perform the following steps to prepare the source MySQL DB instance as the replication source.

### To prepare the source MySQL DB instance

1. Ensure that your client computer has enough disk space available to save the binary logs while setting up replication.
2. Connect to the source MySQL DB instance, and create a replication account by following the directions in [Creating a user for replication](#) in the MySQL documentation.
3. Configure ingress rules on the system running the source MySQL DB instance to allow the external MySQL database to connect during replication. Specify an ingress rule that allows TCP connections to the port used by the source MySQL DB instance from the IP address of the external MySQL database.
4. Specify the egress rules:
  - If the source MySQL DB instance is running in a VPC, specify the ingress rules in a VPC security group. For more information, see [Controlling access with security groups \(p. 1737\)](#).
  - If the source MySQL DB instance isn't running in a VPC, specify the ingress rules in a DB security group. For more information, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).
5. If source MySQL DB instance is running in a VPC, configure VPC ACL rules in addition to the security group ingress rule:
  - Configure an ACL ingress rule to allow TCP connections to the port used by the Amazon RDS instance from the IP address of the external MySQL database.
  - Configure an ACL egress rule to allow TCP connections from ports 1024–65535 to the IP address of the external MySQL database.

For more information about Amazon VPC network ACLs, see [Network ACLs](#) in the *Amazon VPC User Guide*.

6. Ensure that the backup retention period is set long enough that no binary logs are purged during the export. If any of the logs are purged before the export has completed, you must restart replication from the beginning. For more information about setting the backup retention period, see [Working with backups \(p. 330\)](#).
7. Use the `mysql.rds_set_configuration` stored procedure to set the binary log retention period long enough that the binary logs aren't purged during the export. For more information, see [Accessing MySQL binary logs \(p. 548\)](#).
8. Create an Amazon RDS read replica from the source MySQL DB instance to further ensure that the binary logs of the source MySQL DB instance are not purged. For more information, see [Creating a read replica \(p. 284\)](#).

9. After the Amazon RDS read replica has been created, call the `mysql.rds_stop_replication` stored procedure to stop the replication process. The source MySQL DB instance no longer purges its binary log files, so they are available for the replication process.
10. (Optional) Set both the `max_allowed_packet` parameter and the `slave_max_allowed_packet` parameter to the maximum size to avoid replication errors. The maximum size for both parameters is 1 GB. We recommend this setting for both parameters. For information about setting parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

## Copy the database

Perform the following steps to copy the database.

### To copy the database

1. Connect to the RDS read replica of the source MySQL DB instance, and run the MySQL `SHOW REPLICAS STATUS\G` statement. Note the values for the following:

- `Master_Host`
- `Master_Port`
- `Master_Log_File`
- `Exec_Master_Log_Pos`

#### Note

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

2. Use the `mysqldump` utility to create a snapshot, which copies the data from Amazon RDS to your local client computer. Then run another utility to load the data into the external MySQL database. Ensure that your client computer has enough space to hold the `mysqldump` files from the databases to be replicated. This process can take several hours for very large databases. Follow the directions in [Creating a data snapshot using mysqldump](#) in the MySQL documentation.

The following example runs `mysqldump` on a client, and then pipes the dump into the `mysql` client utility, which loads the data into the external MySQL database.

For Linux, macOS, or Unix:

```
mysqldump -h source_MySQL_DB_instance_endpoint \
 -u user \
 -ppassword \
 --port=3306 \
 --single-transaction \
 --routines \
 --triggers \
 --databases database database2 \
 --compress \
 --port 3306
```

For Windows:

```
mysqldump -h source_MySQL_DB_instance_endpoint ^
 -u user ^
 -ppassword ^
 --port=3306 ^
 --single-transaction ^
 --routines ^
 --triggers ^
```

```
--databases database database2 ^
--compress ^
--port 3306
```

The following example runs `mysqldump` on a client and writes the dump to a file.

For Linux, macOS, or Unix:

```
mysqldump -h source_MySQL_DB_instance_endpoint \
-u user \
-ppassword \
--port=3306 \
--single-transaction \
--routines \
--triggers \
--databases database database2 > path/rds-dump.sql
```

For Windows:

```
mysqldump -h source_MySQL_DB_instance_endpoint ^
-u user ^
-ppassword ^
--port=3306 ^
--single-transaction ^
--routines ^
--triggers ^
--databases database database2 > path\rds-dump.sql
```

## Complete the export

Perform the following steps to complete the export.

### To complete the export

1. Load the `mysqldump` files to create the databases on the external MySQL database.
2. On the Amazon RDS read replica, call the `mysql.rds_start_replication` stored procedure. Doing this starts replication from the source MySQL DB instance and exports all source changes that have occurred after you stopped replication from the Amazon RDS read replica.
3. Use the MySQL `CHANGE MASTER` statement to configure the external MySQL database. Specify the ID and password of the user granted `REPLICATION SLAVE` permissions. Specify the `Master_Host`, `Master_Port`, `Relay_Master_Log_File`, and `Exec_Master_Log_Pos` values that you got from the MySQL `SHOW REPLICAS STATUS\G` statement that you ran on the RDS read replica. For more information, see [the MySQL documentation](#).

#### Note

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

4. Use the MySQL `START REPLICAS` command to initiate replication from the source MySQL DB instance to the external MySQL database.

#### Note

Previous versions of MySQL used `START SLAVE` instead of `START REPLICAS`. If you are using a MySQL version before 8.0.23, then use `START SLAVE`.

5. Run the MySQL `SHOW REPLICAS STATUS\G` command on the external MySQL database to verify that it is operating as a read replica. For more information about interpreting the results, see [the MySQL documentation](#).

6. After replication on the external MySQL database has caught up with the source MySQL DB instance, use the MySQL `STOP REPLICA` command to stop replication from the source MySQL DB instance.

**Note**

Previous versions of MySQL used `STOP SLAVE` instead of `STOP REPLICA`. If you are using a MySQL version before 8.0.23, then use `STOP SLAVE`.

7. On the Amazon RDS read replica, call the `mysql.rds_start_replication` stored procedure. Doing this allows Amazon RDS to start purging the binary log files from the source MySQL DB instance.

## Options for MySQL DB instances

This appendix describes options, or additional features, that are available for Amazon RDS instances running the MySQL DB engine. To enable these options, you can add them to a custom option group, and then associate the option group with your DB instance. For more information about working with option groups, see [Working with option groups \(p. 213\)](#).

Amazon RDS supports the following options for MySQL:

Option	Option ID	Engine versions
MariaDB Audit Plugin support (p. 936)	MARIADB_AUDIT_PLUGIN	All MySQL 5.6 versions
		MySQL 5.7.16 and later 5.7 versions
MySQL memcached support (p. 939)	MEMCACHED	All MySQL 5.6, 5.7, and 8.0 versions

## MariaDB Audit Plugin support

Amazon RDS supports using the MariaDB Audit Plugin on MySQL database instances. The MariaDB Audit Plugin records database activity such as users logging on to the database, queries run against the database, and more. The record of database activity is stored in a log file.

## Note

Currently, the MariaDB Audit Plugin is only supported for the following RDS for MySQL versions:

- All 5.6 versions
  - MySQL 5.7.16 and later 5.7 versions

## Audit Plugin option settings

Amazon RDS supports the following settings for the MariaDB Audit Plugin option.

Option setting	Valid values	Default value	Description
SERVER_AUDIT	<code>/rdsdbdata/log/audit/</code>	<code>/rdsdbdata/log/audit/</code>	The location of the log file. The log file contains the record of the activity specified in SERVER_AUDIT_EVENTS. For more information, see <a href="#">Viewing and listing database log files (p. 524)</a> and <a href="#">Accessing MySQL database log files (p. 542)</a> .
SERVER_AUDIT_SIZE	<code>100000000</code>	<code>1000000</code>	The size in bytes that when reached, causes the file to rotate. For more information, see <a href="#">Overview of MySQL database logs (p. 542)</a> .
SERVER_AUDIT_ROTATIONS	<code>100</code>	<code>9</code>	The number of log rotations to save. For more information, see <a href="#">Overview of MySQL database logs (p. 542)</a> and <a href="#">Downloading a database log file (p. 525)</a> .
SERVER_AUDIT_EVENTS	<code>CONNECT, QUERY, QUERY_DDL, QUERY_DML, QUERY_DCL</code>	<code>CONNECT, QUERY</code>	<p>The types of activity to record in the log. Installing the MariaDB Audit Plugin is itself logged.</p> <ul style="list-style-type: none"><li>• <code>CONNECT</code>: Log successful and unsuccessful connections to the database, and disconnections from the database.</li><li>• <code>QUERY</code>: Log the text of all queries run against the database.</li><li>• <code>QUERY_DDL</code>: Similar to the <code>QUERY</code> event, but returns only data definition language (DDL) queries (<code>CREATE</code>, <code>ALTER</code>, and so on).</li><li>• <code>QUERY_DML</code>: Similar to the <code>QUERY</code> event, but returns only data manipulation language (DML) queries (<code>INSERT</code>, <code>UPDATE</code>, and so on, and also <code>SELECT</code>).</li><li>• <code>QUERY_DCL</code>: Similar to the <code>QUERY</code> event, but returns only data control language (DCL) queries (<code>GRANT</code>, <code>REVOKE</code>, and so on).</li></ul> <p>For MySQL, <code>TABLE</code> is not supported.</p>

Option setting	Valid values	Default value	Description
SERVER_AUDIT_INCL_USERS	Multiple comma-separated values	None	Include only activity from the specified users. By default, activity is recorded for all users. SERVER_AUDIT_INCL_USERS and SERVER_AUDIT_EXCL_USERS are mutually exclusive. If you add values to SERVER_AUDIT_INCL_USERS, make sure no values are added to SERVER_AUDIT_EXCL_USERS.
SERVER_AUDIT_EXCL_USERS	Multiple comma-separated values	None	Exclude activity from the specified users. By default, activity is recorded for all users. SERVER_AUDIT_INCL_USERS and SERVER_AUDIT_EXCL_USERS are mutually exclusive. If you add values to SERVER_AUDIT_EXCL_USERS, make sure no values are added to SERVER_AUDIT_INCL_USERS.
SERVER_AUDIT_RDSADMIN	None		<p>The <code>rdsadmin</code> user queries the database every second to check the health of the database. Depending on your other settings, this activity can possibly cause the size of your log file to grow very large, very quickly. If you don't need to record this activity, add the <code>rdsadmin</code> user to the SERVER_AUDIT_EXCL_USERS list.</p> <p><b>Note</b> CONNECT activity is always recorded for all users, even if the user is specified for this option setting.</p>
SERVER_AUDIT_LOGGING	ON	ON	Logging is active. The only valid value is ON. Amazon RDS does not support deactivating logging. If you want to deactivate logging, remove the MariaDB Audit Plugin. For more information, see <a href="#">Removing the MariaDB Audit Plugin (p. 938)</a> .
SERVER_AUDIT_QUERY_STRING_LENGTH	002147483647	1024	The limit on the length of the query string in a record.

## Adding the MariaDB Audit Plugin

The general process for adding the MariaDB Audit Plugin to a DB instance is the following:

- Create a new option group, or copy or modify an existing option group
- Add the option to the option group
- Associate the option group with the DB instance

After you add the MariaDB Audit Plugin, you don't need to restart your DB instance. As soon as the option group is active, auditing begins immediately.

**Important**

Adding the MariaDB Audit Plugin to a DB instance might cause an outage. We recommend adding the MariaDB Audit Plugin during a maintenance window or during a time of low database workload.

### To add the MariaDB Audit Plugin

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group. Choose **mysql** for **Engine**, and choose **5.6** or **5.7** for **Major engine version**. For more information, see [Creating an option group \(p. 215\)](#).
2. Add the **MARIADB\_AUDIT\_PLUGIN** option to the option group, and configure the option settings. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#). For more information about each setting, see [Audit Plugin option settings \(p. 936\)](#).
3. Apply the option group to a new or existing DB instance.
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Viewing and downloading the MariaDB Audit Plugin log

After you enable the MariaDB Audit Plugin, you access the results in the log files the same way you access any other text-based log files. The audit log files are located at `/rdsdbdata/log/audit/`. For information about viewing the log file in the console, see [Viewing and listing database log files \(p. 524\)](#). For information about downloading the log file, see [Downloading a database log file \(p. 525\)](#).

## Modifying MariaDB Audit Plugin settings

After you enable the MariaDB Audit Plugin, you can modify the settings. For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#). For more information about each setting, see [Audit Plugin option settings \(p. 936\)](#).

## Removing the MariaDB Audit Plugin

Amazon RDS doesn't support turning off logging in the MariaDB Audit Plugin. However, you can remove the plugin from a DB instance. When you remove the MariaDB Audit Plugin, the DB instance is restarted automatically to stop auditing.

To remove the MariaDB Audit Plugin from a DB instance, do one of the following:

- Remove the MariaDB Audit Plugin option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- Modify the DB instance and specify a different option group that doesn't include the plugin. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## MySQL memcached support

Amazon RDS supports using the memcached interface to InnoDB tables that was introduced in MySQL 5.6. The memcached API enables applications to use InnoDB tables in a manner similar to NoSQL key-value data stores.

The memcached interface is a simple, key-based cache. Applications use memcached to insert, manipulate, and retrieve key-value data pairs from the cache. MySQL 5.6 introduced a plugin that implements a daemon service that exposes data from InnoDB tables through the memcached protocol. For more information about the MySQL memcached plugin, see [InnoDB integration with memcached](#).

### To enable memcached support for an RDS for MySQL 5.6 or later instance

1. Determine the security group to use for controlling access to the memcached interface. If the set of applications already using the SQL interface are the same set that will access the memcached interface, you can use the existing VPC or DB security group used by the SQL interface. If a different set of applications will access the memcached interface, define a new VPC or DB security group. For more information about managing security groups, see [Controlling access with security groups \(p. 1737\)](#)
2. Create a custom DB option group, selecting MySQL as the engine type and a 5.6 or later version. For more information about creating an option group, see [Creating an option group \(p. 215\)](#).
3. Add the MEMCACHED option to the option group. Specify the port that the memcached interface will use, and the security group to use in controlling access to the interface. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
4. Modify the option settings to configure the memcached parameters, if necessary. For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#).
5. Apply the option group to an instance. Amazon RDS enables memcached support for that instance when the option group is applied:
  - You enable memcached support for a new instance by specifying the custom option group when you launch the instance. For more information about launching a MySQL instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - You enable memcached support for an existing instance by specifying the custom option group when you modify the instance. For more information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
6. Specify which columns in your MySQL tables can be accessed through the memcached interface. The memcached plug-in creates a catalog table named `containers` in a dedicated database named `innodb_memcache`. You insert a row into the `containers` table to map an InnoDB table for access through memcached. You specify a column in the InnoDB table that is used to store the memcached key values, and one or more columns that are used to store the data values associated with the key. You also specify a name that a memcached application uses to refer to that set of columns. For details on inserting rows in the `containers` table, see [InnoDB memcached plugin internals](#). For an example of mapping an InnoDB table and accessing it through memcached, see [Writing applications for the InnoDB memcached plugin](#).
7. If the applications accessing the memcached interface are on different computers or EC2 instances than the applications using the SQL interface, add the connection information for those computers to the VPC or DB security group associated with the MySQL instance. For more information about managing security groups, see [Controlling access with security groups \(p. 1737\)](#).

You turn off the memcached support for an instance by modifying the instance and specifying the default option group for your MySQL version. For more information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## MySQL memcached security considerations

The memcached protocol does not support user authentication. For more information about MySQL memcached security considerations, see [memcached deployment](#) and [Using memcached as a MySQL caching layer](#).

You can take the following actions to help increase the security of the memcached interface:

- Specify a different port than the default of 11211 when adding the **MEMCACHED** option to the option group.
- Ensure that you associate the memcached interface with either a VPC or DB security group that limits access to known, trusted client addresses or EC2 instances. For more information about managing security groups, see [Controlling access with security groups \(p. 1737\)](#).

## MySQL memcached connection information

To access the memcached interface, an application must specify both the DNS name of the Amazon RDS instance and the memcached port number. For example, if an instance has a DNS name of `my-cache-instance.cg034hpkmmjt.region.rds.amazonaws.com` and the memcached interface is using port 11212, the connection information specified in PHP would be:

```
<?php

$cache = new Memcache;
$cache->connect('my-cache-instance.cg034hpkmmjt.region.rds.amazonaws.com', 11212);
?>
```

### To find the DNS name and memcached port of a MySQL DB instance

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the top right corner of the AWS Management Console, select the region that contains the DB instance.
3. In the navigation pane, choose **Databases**.
4. Choose the MySQL DB instance name to display its details.
5. In the **Connect** section, note the value of the **Endpoint** field. The DNS name is the same as the endpoint. Also, note that the port in the **Connect** section is not used to access the memcached interface.
6. In the **Details** section, note the name listed in the **Option Group** field.
7. In the navigation pane, choose **Option groups**.
8. Choose the name of the option group used by the MySQL DB instance to show the option group details. In the **Options** section, note the value of the **Port** setting for the **MEMCACHED** option.

## MySQL memcached option settings

Amazon RDS exposes the MySQL memcached parameters as option settings in the Amazon RDS **MEMCACHED** option.

### MySQL memcached parameters

- **DAEMON\_MEMCACHED\_R\_BATCH\_SIZE** – an integer that specifies how many memcached read operations (get) to perform before doing a COMMIT to start a new transaction. The allowed values are 1 to 4294967295; the default is 1. The option does not take effect until the instance is restarted.

- **DAEMON\_MEMCACHED\_W\_BATCH\_SIZE** – an integer that specifies how many memcached write operations, such as add, set, or incr, to perform before doing a COMMIT to start a new transaction. The allowed values are 1 to 4294967295; the default is 1. The option does not take effect until the instance is restarted.
- **INNODB\_API\_BK\_COMMIT\_INTERVAL** – an integer that specifies how often to auto-commit idle connections that use the InnoDB memcached interface. The allowed values are 1 to 1073741824; the default is 5. The option takes effect immediately, without requiring that you restart the instance.
- **INNODB\_API\_DISABLE\_ROWLOCK** – a Boolean that disables (1 (true)) or enables (0 (false)) the use of row locks when using the InnoDB memcached interface. The default is 0 (false). The option does not take effect until the instance is restarted.
- **INNODB\_API\_ENABLE\_MDL** – a Boolean that when set to 0 (false) locks the table used by the InnoDB memcached plugin, so that it cannot be dropped or altered by DDL through the SQL interface. The default is 0 (false). The option does not take effect until the instance is restarted.
- **INNODB\_API\_TRX\_LEVEL** – an integer that specifies the transaction isolation level for queries processed by the memcached interface. The allowed values are 0 to 3. The default is 0. The option does not take effect until the instance is restarted.

Amazon RDS configures these MySQL memcached parameters, and they cannot be modified: **DAEMON\_MEMCACHED\_LIB\_NAME**, **DAEMON\_MEMCACHED\_LIB\_PATH**, and **INNODB\_API\_ENABLE\_BINLOG**. The parameters that MySQL administrators set by using `daemon_memcached_options` are available as individual **MEMCACHED** option settings in Amazon RDS.

## MySQL `daemon_memcached_options` parameters

- **BINDING\_PROTOCOL** – a string that specifies the binding protocol to use. The allowed values are `auto`, `ascii`, or `binary`. The default is `auto`, which means the server automatically negotiates the protocol with the client. The option does not take effect until the instance is restarted.
- **BACKLOG\_QUEUE\_LIMIT** – an integer that specifies how many network connections can be waiting to be processed by memcached. Increasing this limit may reduce errors received by a client that is not able to connect to the memcached instance, but does not improve the performance of the server. The allowed values are 1 to 2048; the default is 1024. The option does not take effect until the instance is restarted.
- **CAS\_DISABLED** – a Boolean that enables (1 (true)) or disables (0 (false)) the use of compare and swap (CAS), which reduces the per-item size by 8 bytes. The default is 0 (false). The option does not take effect until the instance is restarted.
- **CHUNK\_SIZE** – an integer that specifies the minimum chunk size, in bytes, to allocate for the smallest item's key, value, and flags. The allowed values are 1 to 48. The default is 48 and you can significantly improve memory efficiency with a lower value. The option does not take effect until the instance is restarted.
- **CHUNK\_SIZE\_GROWTH\_FACTOR** – a float that controls the size of new chunks. The size of a new chunk is the size of the previous chunk times `CHUNK_SIZE_GROWTH_FACTOR`. The allowed values are 1 to 2; the default is 1.25. The option does not take effect until the instance is restarted.
- **ERROR\_ON\_MEMORY\_EXHAUSTED** – a Boolean that when set to 1 (true) specifies that memcached will return an error rather than evicting items when there is no more memory to store items. If set to 0 (false), memcached will evict items if there is no more memory. The default is 0 (false). The option does not take effect until the instance is restarted.
- **MAX\_SIMULTANEOUS\_CONNECTIONS** – an integer that specifies the maximum number of concurrent connections. Setting this value to anything under 10 prevents MySQL from starting. The allowed values are 10 to 1024; the default is 1024. The option does not take effect until the instance is restarted.
- **VERBOSITY** – a string that specifies the level of information logged in the MySQL error log by the memcached service. The default is `v`. The option does not take effect until the instance is restarted. The allowed values are:

- **v** – Logs errors and warnings while running the main event loop.
- **vv** – In addition to the information logged by **v**, also logs each client command and the response.
- **vvv** – In addition to the information logged by **vv**, also logs internal state transitions.

Amazon RDS configures these MySQL `DAEMON_MEMCACHED_OPTIONS` parameters, they cannot be modified: `DAEMON_PROCESS`, `LARGE_MEMORY_PAGES`, `MAXIMUM_CORE_FILE_LIMIT`, `MAX_ITEM_SIZE`, `LOCK_DOWN_PAGE_MEMORY`, `MASK`, `IDFILE`, `REQUESTS_PER_EVENT`, `SOCKET`, and `USER`.

# Common DBA tasks for MySQL DB instances

This section describes the Amazon RDS-specific implementations of some common DBA tasks for DB instances running the MySQL database engine. In order to deliver a managed service experience, Amazon RDS does not provide shell access to DB instances, and it restricts access to certain system procedures and tables that require advanced privileges.

For information about working with MySQL log files on Amazon RDS, see [Accessing MySQL database log files \(p. 542\)](#).

## Topics

- [Ending a session or query \(p. 943\)](#)
- [Skipping the current replication error \(p. 943\)](#)
- [Working with InnoDB tablespaces to improve crash recovery times \(p. 944\)](#)
- [Managing the global status history \(p. 946\)](#)

## Ending a session or query

You can end user sessions or queries on DB instances by using the `rds_kill` and `rds_kill_query` commands. First connect to your MySQL DB instance, then issue the appropriate command as shown following. For more information, see [Connecting to a DB instance running the MySQL database engine \(p. 849\)](#).

```
CALL mysql.rds_kill(thread-ID)
CALL mysql.rds_kill_query(thread-ID)
```

For example, to end the session that is running on thread 99, you would type the following:

```
CALL mysql.rds_kill(99);
```

To end the query that is running on thread 99, you would type the following:

```
CALL mysql.rds_kill_query(99);
```

## Skipping the current replication error

Amazon RDS provides a mechanism for you to skip an error on your read replicas if the error is causing your read replica to stop responding and the error doesn't affect the integrity of your data. First connect to your MySQL DB instance, then issue the appropriate commands as shown following. For more information, see [Connecting to a DB instance running the MySQL database engine \(p. 849\)](#).

### Note

You should first verify that the error can be safely skipped. In a MySQL utility, connect to the read replica and run the following MySQL command:

```
SHOW REPLICAS STATUS\G
```

For information about the values returned, see [the MySQL documentation](#).

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

To skip the error, you can issue the following command:

```
CALL mysql.rds_skip_repl_error;
```

This command has no effect if you run it on the source DB instance, or on a read replica that has not encountered a replication error.

For more information, such as the versions of MySQL that support `mysql.rds_skip_repl_error`, see [mysql.rds\\_skip\\_repl\\_error \(p. 978\)](#).

#### Important

If you attempt to call `mysql.rds_skip_repl_error` and encounter the following error: `ERROR 1305 (42000): PROCEDURE mysql.rds_skip_repl_error does not exist`, then upgrade your MySQL DB instance to the latest minor version or one of the minimum minor versions listed in [mysql.rds\\_skip\\_repl\\_error \(p. 978\)](#).

## Working with InnoDB tablespaces to improve crash recovery times

Every table in MySQL consists of a table definition, data, and indexes. The MySQL storage engine InnoDB stores table data and indexes in a *tablespace*. InnoDB creates a global shared tablespace that contains a data dictionary and other relevant metadata, and it can contain table data and indexes. InnoDB can also create separate tablespaces for each table and partition. These separate tablespaces are stored in files with a .ibd extension and the header of each tablespace contains a number that uniquely identifies it.

Amazon RDS provides a parameter in a MySQL parameter group called `innodb_file_per_table`. This parameter controls whether InnoDB adds new table data and indexes to the shared tablespace (by setting the parameter value to 0) or to individual tablespaces (by setting the parameter value to 1). Amazon RDS sets the default value for `innodb_file_per_table` parameter to 1, which allows you to drop individual InnoDB tables and reclaim storage used by those tables for the DB instance. In most use cases, setting the `innodb_file_per_table` parameter to 1 is the recommended setting.

You should set the `innodb_file_per_table` parameter to 0 when you have a large number of tables, such as over 1000 tables when you use standard (magnetic) or general purpose SSD storage or over 10,000 tables when you use Provisioned IOPS storage. When you set this parameter to 0, individual tablespaces are not created and this can improve the time it takes for database crash recovery.

MySQL processes each metadata file, which includes tablespaces, during the crash recovery cycle. The time it takes MySQL to process the metadata information in the shared tablespace is negligible compared to the time it takes to process thousands of tablespace files when there are multiple tablespaces. Because the tablespace number is stored within the header of each file, the aggregate time to read all the tablespace files can take up to several hours. For example, a million InnoDB tablespaces on standard storage can take from five to eight hours to process during a crash recovery cycle. In some cases, InnoDB can determine that it needs additional cleanup after a crash recovery cycle so it will begin another crash recovery cycle, which will extend the recovery time. Keep in mind that a crash recovery cycle also entails rolling-back transactions, fixing broken pages, and other operations in addition to the processing of tablespace information.

Since the `innodb_file_per_table` parameter resides in a parameter group, you can change the parameter value by editing the parameter group used by your DB instance without having to reboot the DB instance. After the setting is changed, for example, from 1 (create individual tables) to 0 (use shared tablespace), new InnoDB tables will be added to the shared tablespace while existing tables continue to have individual tablespaces. To move an InnoDB table to the shared tablespace, you must use the `ALTER TABLE` command.

## Migrating multiple tablespaces to the shared tablespace

You can move an InnoDB table's metadata from its own tablespace to the shared tablespace, which will rebuild the table metadata according to the `innodb_file_per_table` parameter setting. First

connect to your MySQL DB instance, then issue the appropriate commands as shown following. For more information, see [Connecting to a DB instance running the MySQL database engine \(p. 849\)](#).

```
ALTER TABLE table_name ENGINE = InnoDB, ALGORITHM=COPY;
```

For example, the following query returns an `ALTER TABLE` statement for every InnoDB table that is not in the shared tablespace.

**For MySQL 5.6 and 5.7 DB instances:**

```
SELECT CONCAT('ALTER TABLE `',
REPLACE(LEFT(NAME , INSTR((NAME), '/') - 1), '`, ``'), `.``,
REPLACE(SUBSTR(NAME FROM INSTR(NAME, '/') + 1), '`, ``'), `` ENGINE=InnoDB,
ALGORITHM=COPY;') AS Query
FROM INFORMATION_SCHEMA.INNODB_SYS_TABLES
WHERE SPACE <> 0 AND LEFT(NAME, INSTR((NAME), '/') - 1) NOT IN ('mysql','');
```

**For MySQL 8.0 DB instances:**

```
SELECT CONCAT('ALTER TABLE `',
REPLACE(LEFT(NAME , INSTR((NAME), '/') - 1), '`, ``'), `.``,
REPLACE(SUBSTR(NAME FROM INSTR(NAME, '/') + 1), '`, ``'), `` ENGINE=InnoDB,
ALGORITHM=COPY;') AS Query
FROM INFORMATION_SCHEMA.INNODB_TABLES
WHERE SPACE <> 0 AND LEFT(NAME, INSTR((NAME), '/') - 1) NOT IN ('mysql','');
```

Rebuilding a MySQL table to move the table's metadata to the shared tablespace requires additional storage space temporarily to rebuild the table, so the DB instance must have storage space available. During rebuilding, the table is locked and inaccessible to queries. For small tables or tables not frequently accessed, this might not be an issue. For large tables or tables frequently accessed in a heavily concurrent environment, you can rebuild tables on a read replica.

You can create a read replica and migrate table metadata to the shared tablespace on the read replica. While the `ALTER TABLE` statement blocks access on the read replica, the source DB instance is not affected. The source DB instance will continue to generate its binary logs while the read replica lags during the table rebuilding process. Because the rebuilding requires additional storage space and the replay log file can become large, you should create a read replica with storage allocated that is larger than the source DB instance.

To create a read replica and rebuild InnoDB tables to use the shared tablespace, take the following steps:

1. Make sure that backup retention is enabled on the source DB instance so that binary logging is enabled.
2. Use the AWS Management Console or AWS CLI to create a read replica for the source DB instance. Because the creation of a read replica involves many of the same processes as crash recovery, the creation process can take some time if there is a large number of InnoDB tablespaces. Allocate more storage space on the read replica than is currently used on the source DB instance.
3. When the read replica has been created, create a parameter group with the parameter settings `read_only = 0` and `innodb_file_per_table = 0`. Then associate the parameter group with the read replica.
4. Issue the following SQL statement for all tables that you want migrated on the replica:

```
ALTER TABLE name ENGINE = InnoDB
```

5. When all of your `ALTER TABLE` statements have completed on the read replica, verify that the read replica is connected to the source DB instance and that the two instances are in sync.

6. Use the console or CLI to promote the read replica to be the instance. Make sure that the parameter group used for the new standalone DB instance has the `innodb_file_per_table` parameter set to 0. Change the name of the new standalone DB instance, and point any applications to the new standalone DB instance.

## Managing the global status history

MySQL maintains many status variables that provide information about its operation. Their value can help you detect locking or memory issues on a DB instance. The values of these status variables are cumulative since last time the DB instance was started. You can reset most status variables to 0 by using the `FLUSH STATUS` command.

To allow for monitoring of these values over time, Amazon RDS provides a set of procedures that will snapshot the values of these status variables over time and write them to a table, along with any changes since the last snapshot. This infrastructure, called Global Status History (GoSH), is installed on all MySQL DB instances starting with versions 5.5.23. GoSH is disabled by default.

To enable GoSH, you first enable the event scheduler from a DB parameter group by setting the parameter `event_scheduler` to ON. For information about creating and modifying a DB parameter group, see [Working with DB parameter groups \(p. 229\)](#).

You can then use the procedures in the following table to enable and configure GoSH. First connect to your MySQL DB instance, then issue the appropriate commands as shown following. For more information, see [Connecting to a DB instance running the MySQL database engine \(p. 849\)](#). For each procedure, type the following:

```
CALL procedure-name;
```

Where *procedure-name* is one of the procedures in the table.

Procedure	Description
<code>mysql.rds_enable_gsh_collector</code>	Enables GoSH to take default snapshots at intervals specified by <code>rds_set_gsh_collector</code> .
<code>mysql.rds_set_gsh_collector</code>	Specifies the interval, in minutes, between snapshots. Default value is 5.
<code>mysql.rds_disable_gsh_collector</code>	Disables snapshots.
<code>mysql.rds_collect_global_status</code>	Takes a snapshot on demand.
<code>mysql.rds_enable_gsh_rotation</code>	Enables rotation of the contents of the <code>mysql.rds_global_status_history</code> table to <code>mysql.rds_global_status_history_old</code> at intervals specified by <code>rds_set_gsh_rotation</code> .
<code>mysql.rds_set_gsh_rotation</code>	Specifies the interval, in days, between table rotations. Default value is 7.
<code>mysql.rds_disable_gsh_rotation</code>	Disables table rotation.
<code>mysql.rds_rotate_global_status_history</code>	Rotates the contents of the <code>mysql.rds_global_status_history</code> table to <code>mysql.rds_global_status_history_old</code> on demand.

When GoSH is running, you can query the tables that it writes to. For example, to query the hit ratio of the Innodb buffer pool, you would issue the following query:

```
select a.collection_end, a.collection_start, ((a.variable_Delta-b.variable_delta)/
a.variable_delta)*100 as "HitRatio"
 from mysql.rds_global_status_history as a join mysql.rds_global_status_history as b on
a.collection_end = b.collection_end
 where a.variable_name = 'Innodb_buffer_pool_read_requests' and b.variable_name =
'Innodb_buffer_pool_reads'
```

# Using Kerberos authentication for MySQL

You can use Kerberos authentication to authenticate users when they connect to your MySQL DB instance. The DB instance works with AWS Directory Service for Microsoft Active Directory (AWS Managed Microsoft AD) to enable Kerberos authentication. When users authenticate with a MySQL DB instance joined to the trusting domain, authentication requests are forwarded. Forwarded requests go to the domain directory that you create with AWS Directory Service.

Keeping all of your credentials in the same directory can save you time and effort. With this approach, you have a centralized place for storing and managing credentials for multiple DB instances. Using a directory can also improve your overall security profile.

Amazon RDS supports Kerberos authentication for MySQL DB instances in the following AWS Regions:

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Ireland)
- Europe (London)
- Europe (Stockholm)
- South America (São Paulo)
- China (Beijing)
- China (Ningxia)

To set up Kerberos authentication for a MySQL DB instance, complete the following general steps, described in more detail later:

1. Use AWS Managed Microsoft AD to create an AWS Managed Microsoft AD directory. You can use the AWS Management Console, the AWS CLI, or the AWS Directory Service to create the directory. For details about doing so, see [Create your AWS Managed Microsoft AD directory](#) in the *AWS Directory Service Administration Guide*.
2. Create an AWS Identity and Access Management (IAM) role that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess`. The role allows Amazon RDS to make calls to your directory.

For the role to allow access, the AWS Security Token Service (AWS STS) endpoint must be activated in the AWS Region for your AWS account. AWS STS endpoints are active by default in all AWS Regions, and you can use them without any further actions. For more information, see [Activating and deactivating AWS STS in an AWS Region](#) in the *IAM User Guide*.

3. Create and configure users in the AWS Managed Microsoft AD directory using the Microsoft Active Directory tools. For more information about creating users in your Active Directory, see [Manage users and groups in AWS managed Microsoft AD](#) in the *AWS Directory Service Administration Guide*.
4. Create or modify a MySQL DB instance. If you use either the CLI or RDS API in the create request, specify a domain identifier with the `Domain` parameter. Use the `d-*` identifier that was generated when you created your directory and the name of the role that you created.

If you modify an existing MySQL DB instance to use Kerberos authentication, set the domain and IAM role parameters for the DB instance. Locate the DB instance in the same VPC as the domain directory.

5. Use the Amazon RDS master user credentials to connect to the MySQL DB instance. Create the user in MySQL using the `CREATE USER` clause `IDENTIFIED WITH 'auth_pam'`. Users that you create this way can log in to the MySQL DB instance using Kerberos authentication.

## Setting up Kerberos authentication for MySQL DB instances

You use AWS Managed Microsoft AD to set up Kerberos authentication for a MySQL DB instance. To set up Kerberos authentication, you take the following steps.

### Step 1: Create a directory using AWS Managed Microsoft AD

AWS Directory Service creates a fully managed Active Directory in the AWS Cloud. When you create an AWS Managed Microsoft AD directory, AWS Directory Service creates two domain controllers and Domain Name System (DNS) servers on your behalf. The directory servers are created in different subnets in a VPC. This redundancy helps make sure that your directory remains accessible even if a failure occurs.

When you create an AWS Managed Microsoft AD directory, AWS Directory Service performs the following tasks on your behalf:

- Sets up an Active Directory within the VPC.
- Creates a directory administrator account with the user name Admin and the specified password. You use this account to manage your directory.

#### Note

Be sure to save this password. AWS Directory Service doesn't store it. You can reset it, but you can't retrieve it.

- Creates a security group for the directory controllers.

When you launch an AWS Managed Microsoft AD, AWS creates an Organizational Unit (OU) that contains all of your directory's objects. This OU has the NetBIOS name that you typed when you created your directory and is located in the domain root. The domain root is owned and managed by AWS.

The Admin account that was created with your AWS Managed Microsoft AD directory has permissions for the most common administrative activities for your OU:

- Create, update, or delete users
- Add resources to your domain such as file or print servers, and then assign permissions for those resources to users in your OU
- Create additional OUs and containers
- Delegate authority
- Restore deleted objects from the Active Directory Recycle Bin
- Run AD and DNS Windows PowerShell modules on the Active Directory Web Service

The Admin account also has rights to perform the following domain-wide activities:

- Manage DNS configurations (add, remove, or update records, zones, and forwarders)
- View DNS event logs
- View security event logs

## To create a directory with AWS Managed Microsoft AD

1. Sign in to the AWS Management Console and open the AWS Directory Service console at <https://console.aws.amazon.com/directoryservicev2/>.
2. In the navigation pane, choose **Directories** and choose **Set up Directory**.
3. Choose **AWS Managed Microsoft AD**. AWS Managed Microsoft AD is the only option that you can currently use with Amazon RDS.
4. Enter the following information:

### Directory DNS name

The fully qualified name for the directory, such as `corp.example.com`.

### Directory NetBIOS name

The short name for the directory, such as `CORP`.

### Directory description

(Optional) A description for the directory.

### Admin password

The password for the directory administrator. The directory creation process creates an administrator account with the user name Admin and this password.

The directory administrator password and can't include the word "admin." The password is case-sensitive and must be 8–64 characters in length. It must also contain at least one character from three of the following four categories:

- Lowercase letters (a–z)
- Uppercase letters (A–Z)
- Numbers (0–9)
- Non-alphanumeric characters (~!@#\$%^&\*\_+=`|\{}{};:"";<>,?./)

### Confirm password

The administrator password retyped.

5. Choose **Next**.
6. Enter the following information in the **Networking** section and then choose **Next**:

### VPC

The VPC for the directory. Create the MySQL DB instance in this same VPC.

### Subnets

Subnets for the directory servers. The two subnets must be in different Availability Zones.

7. Review the directory information and make any necessary changes. When the information is correct, choose **Create directory**.

## Step 2: Create the IAM role for use by Amazon RDS

For Amazon RDS to call AWS Directory Service for you, an IAM role that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess` is required. This role allows Amazon RDS to make calls to the AWS Directory Service.

When a DB instance is created using the AWS Management Console and the console user has the `iam:CreateRole` permission, the console creates this role automatically. In this case, the role name is `rds-directoryservice-kerberos-access-role`. Otherwise, you must create the IAM role manually. When you create this IAM role, choose `Directory Service`, and attach the AWS managed policy `AmazonRDSDirectoryServiceAccess` to it.

For more information about creating IAM roles for a service, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.

### Note

The IAM role used for Windows Authentication for RDS for Microsoft SQL Server can't be used for RDS for MySQL.

Optionally, you can create policies with the required permissions instead of using the managed IAM policy `AmazonRDSDirectoryServiceAccess`. In this case, the IAM role must have the following IAM trust policy.

{

```
"Version": "2012-10-17",
"Statement": [
 {
 "Sid": "",
 "Effect": "Allow",
 "Principal": {
 "Service": [
 "directoryservice.rds.amazonaws.com",
 "rds.amazonaws.com"
]
 },
 "Action": "sts:AssumeRole"
 }
]
```

The role must also have the following IAM role policy.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Action": [
 "ds:DescribeDirectories",
 "ds:AuthorizeApplication",
 "ds:UnauthorizeApplication",
 "ds:GetAuthorizedApplicationDetails"
],
 "Effect": "Allow",
 "Resource": "*"
 }
]
}
```

## Step 3: Create and configure users

You can create users with the Active Directory Users and Computers tool. This tool is part of the Active Directory Domain Services and Active Directory Lightweight Directory Services tools. Users represent individual people or entities that have access to your directory.

To create users in an AWS Directory Service directory, you must be connected to an Amazon EC2 instance based on Microsoft Windows. This instance must be a member of the AWS Directory Service directory and be logged in as a user that has privileges to create users. For more information, see [Manage users and groups in AWS Managed Microsoft AD](#) in the *AWS Directory Service Administration Guide*.

## Step 4: Create or modify a MySQL DB instance

Create or modify a MySQL DB instance for use with your directory. You can use the console, CLI, or RDS API to associate a DB instance with a directory. You can do this in one of the following ways:

- Create a new MySQL DB instance using the console, the [create-db-instance](#) CLI command, or the [CreateDBInstance](#) RDS API operation.

For instructions, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

- Modify an existing MySQL DB instance using the console, the [modify-db-instance](#) CLI command, or the [ModifyDBInstance](#) RDS API operation.

For instructions, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

- Restore a MySQL DB instance from a DB snapshot using the console, the [restore-db-instance-from-db-snapshot](#) CLI command, or the [RestoreDBInstanceFromDBSnapshot](#) RDS API operation.

For instructions, see [Restoring from a DB snapshot \(p. 352\)](#).

- Restore a MySQL DB instance to a point-in-time using the console, the [restore-db-instance-to-point-in-time](#) CLI command, or the [RestoreDBInstanceToPointInTime](#) RDS API operation.

For instructions, see [Restoring a DB instance to a specified time \(p. 392\)](#).

Kerberos authentication is only supported for MySQL DB instances in a VPC. The DB instance can be in the same VPC as the directory, or in a different VPC. The DB instance must use a security group that allows egress within the directory's VPC so the DB instance can communicate with the directory.

When you use the console to create a DB instance, choose **Password and Kerberos authentication** in the **Database authentication** section. Choose **Browse Directory** and then select the directory, or choose **Create a new directory**.

**Database authentication**

Database authentication options [Info](#)

Password authentication  
Authenticates using database passwords.

Password and IAM database authentication  
Authenticates using the database password and user credentials through AWS IAM users and roles.

Password and Kerberos authentication  
Choose a directory in which you want to allow authorized users to authenticate with this DB instance using Kerberos Authentication.

Directory

[Browse Directory](#)

When you use the console to modify or restore a DB instance, choose the directory in the **Kerberos authentication** section, or choose **Create a new directory**.

**Kerberos authentication** [Refresh](#)

Choose a directory in which you want to allow authorized users to authenticate with this DB instance using Kerberos authentication.

Directory

[Create a new directory](#)

By choosing a directory and continuing with database instance creation you authorize Amazon RDS to create the IAM role necessary for using Kerberos authentication

Use the CLI or RDS API to associate a DB instance with a directory. The following parameters are required for the DB instance to be able to use the domain directory you created:

- For the `--domain` parameter, use the domain identifier ("d-\*" identifier) generated when you created the directory.
- For the `--domain-iam-role-name` parameter, use the role you created that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess`.

For example, the following CLI command modifies a DB instance to use a directory.

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
--db-instance-identifier mydbinstance \
--domain d-ID \
--domain-iam-role-name role-name
```

For Windows:

```
aws rds modify-db-instance ^
--db-instance-identifier mydbinstance ^
--domain d-ID ^
--domain-iam-role-name role-name
```

**Important**

If you modify a DB instance to enable Kerberos authentication, reboot the DB instance after making the change.

## Step 5: Create Kerberos authentication MySQL logins

Use the Amazon RDS master user credentials to connect to the MySQL DB instance as you do any other DB instance. The DB instance is joined to the AWS Managed Microsoft AD domain. Thus, you can provision MySQL logins and users from the Active Directory users in your domain. Database permissions are managed through standard MySQL permissions that are granted to and revoked from these logins.

You can allow an Active Directory user to authenticate with MySQL. To do this, first use the Amazon RDS master user credentials to connect to the MySQL DB instance as with any other DB instance. After you're logged in, create an externally authenticated user with PAM (Pluggable Authentication Modules) in MySQL as shown following.

```
CREATE USER 'testuser'@'%' IDENTIFIED WITH 'auth_pam';
UPDATE mysql.user SET ssl_type = 'any' WHERE ssl_type = '' AND PLUGIN = 'auth_pam' and USER = 'testuser';
FLUSH PRIVILEGES;
```

Replace *testuser* with the user name. Users (both humans and applications) from your domain can now connect to the DB instance from a domain joined client machine using Kerberos authentication.

**Important**

We strongly recommended that clients use SSL/TLS connections when using PAM authentication. If they don't use SSL/TLS connections, the password might be sent as clear text in some cases.

## Managing a DB instance in a domain

You can use the CLI or the RDS API to manage your DB instance and its relationship with your managed Active Directory. For example, you can associate an Active Directory for Kerberos authentication and disassociate an Active Directory to disable Kerberos authentication. You can also move a DB instance to be externally authenticated by one Active Directory to another.

For example, using the Amazon RDS API, you can do the following:

- To reattempt enabling Kerberos authentication for a failed membership, use the `ModifyDBInstance` API operation and specify the current membership's directory ID.
- To update the IAM role name for membership, use the `ModifyDBInstance` API operation and specify the current membership's directory ID and the new IAM role.

- To disable Kerberos authentication on a DB instance, use the `ModifyDBInstance` API operation and specify `none` as the domain parameter.
- To move a DB instance from one domain to another, use the `ModifyDBInstance` API operation and specify the domain identifier of the new domain as the domain parameter.
- To list membership for each DB instance, use the `DescribeDBInstances` API operation.

## Understanding domain membership

After you create or modify your DB instance, it becomes a member of the domain. You can view the status of the domain membership for the DB instance by running the `describe-db-instances` CLI command. The status of the DB instance can be one of the following:

- `kerberos-enabled` – The DB instance has Kerberos authentication enabled.
- `enabling-kerberos` – AWS is in the process of enabling Kerberos authentication on this DB instance.
- `pending-enable-kerberos` – The enabling of Kerberos authentication is pending on this DB instance.
- `pending-maintenance-enable-kerberos` – AWS will attempt to enable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- `pending-disable-kerberos` – The disabling of Kerberos authentication is pending on this DB instance.
- `pending-maintenance-disable-kerberos` – AWS will attempt to disable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- `enable-kerberos-failed` – A configuration problem has prevented AWS from enabling Kerberos authentication on the DB instance. Check and fix your configuration before reissuing the DB instance `modify` command.
- `disabling-kerberos` – AWS is in the process of disabling Kerberos authentication on this DB instance.

A request to enable Kerberos authentication can fail because of a network connectivity issue or an incorrect IAM role. For example, suppose that you create a DB instance or modify an existing DB instance and the attempt to enable Kerberos authentication fails. If this happens, re-issue the `modify` command or modify the newly created DB instance to join the domain.

## Connecting to MySQL with Kerberos authentication

To connect to MySQL with Kerberos authentication, you must log in using the Kerberos authentication type.

To create a database user that you can connect to using Kerberos authentication, use an `IDENTIFIED WITH` clause on the `CREATE USER` statement. For instructions, see [Step 5: Create Kerberos authentication MySQL logins \(p. 955\)](#).

To avoid errors, use the MariaDB `mysql` client. You can download MariaDB software at <https://downloads.mariadb.org/>.

At a command prompt, connect to one of the endpoints associated with your MySQL DB instance. Follow the general procedures in [Connecting to a DB instance running the MySQL database engine \(p. 849\)](#). When you're prompted for the password, enter the Kerberos password associated with that user name.

## Restoring a MySQL DB instance and adding it to a domain

You can restore a DB snapshot or complete a point-in-time restore for a MySQL DB instance and then add it to a domain. After the DB instance is restored, modify the DB instance using the process explained in [Step 4: Create or modify a MySQL DB instance \(p. 953\)](#) to add the DB instance to a domain.

## Kerberos authentication MySQL limitations

The following limitations apply to Kerberos authentication for MySQL:

- A Managed Active Directory that has been shared with you isn't supported.
- Kerberos authentication is supported for the following Amazon RDS for MySQL versions:
  - Amazon RDS for MySQL version 8.0.13, 8.0.15, and 8.0.16
  - Amazon RDS for MySQL version 5.7.24, 5.7.25, and 5.7.26
- You must reboot the DB instance after enabling the feature.
- The domain name length can't be longer than 61 characters.
- You can't enable Kerberos authentication and IAM authentication at the same time. Choose one authentication method or the other for your MySQL DB instance.
- Don't modify the DB instance port after enabling the feature.
- Don't use Kerberos authentication with read replicas.
- To delete a DB instance with this feature enabled, first disable the feature. To do this, use the `modify-db-instance` CLI command for the DB instance and specify `none` for the `--domain` parameter.

If you use the CLI or RDS API to delete a DB instance with this feature enabled, expect a delay.

# Known issues and limitations for Amazon RDS for MySQL

Known issues and limitations for working with Amazon RDS for MySQL are as follows.

## Topics

- [Inconsistent InnoDB buffer pool size \(p. 958\)](#)
- [Index merge optimization returns wrong results \(p. 958\)](#)
- [Log file size \(p. 959\)](#)
- [MySQL parameter exceptions for Amazon RDS DB instances \(p. 959\)](#)
- [MySQL file size limits in Amazon RDS \(p. 960\)](#)
- [MySQL Keyring Plugin not supported \(p. 961\)](#)

## Inconsistent InnoDB buffer pool size

For MySQL 5.7, there is currently a bug in the way that the InnoDB buffer pool size is managed. MySQL 5.7 might adjust the value of the `innodb_buffer_pool_size` parameter to a large value that can result in the InnoDB buffer pool growing too large and using up too much memory. This effect can cause the MySQL database engine to stop running or can prevent the MySQL database engine from starting. This issue is more common for DB instance classes that have less memory available.

To resolve this issue, set the value of the `innodb_buffer_pool_size` parameter to a multiple of the product of the `innodb_buffer_pool_instances` parameter value and the `innodb_buffer_pool_chunk_size` parameter value. For example, you might set the `innodb_buffer_pool_size` parameter value to a multiple of eight times the product of the `innodb_buffer_pool_instances` and `innodb_buffer_pool_chunk_size` parameter values, as shown in the following example.

```
innodb_buffer_pool_chunk_size = 536870912
innodb_buffer_pool_instances = 4
innodb_buffer_pool_size = (536870912 * 4) * 8 = 17179869184
```

For details on this MySQL 5.7 bug, go to <https://bugs.mysql.com/bug.php?id=79379> in the MySQL documentation.

## Index merge optimization returns wrong results

Queries that use index merge optimization might return wrong results due to a bug in the MySQL query optimizer that was introduced in MySQL 5.5.37. When you issue a query against a table with multiple indexes the optimizer scans ranges of rows based on the multiple indexes, but does not merge the results together correctly. For more information on the query optimizer bug, go to <http://bugs.mysql.com/bug.php?id=72745> and <http://bugs.mysql.com/bug.php?id=68194> in the MySQL bug database.

For example, consider a query on a table with two indexes where the search arguments reference the indexed columns.

```
SELECT * FROM table1
WHERE indexed_col1 = 'value1' AND indexed_col2 = 'value2';
```

In this case, the search engine will search both indexes. However, due to the bug, the merged results are incorrect.

To resolve this issue, you can do one of the following:

- Set the `optimizer_switch` parameter to `index_merge=off` in the DB parameter group for your MySQL DB instance. For information on setting DB parameter group parameters, see [Working with DB parameter groups \(p. 229\)](#).
- Upgrade your MySQL DB instance to MySQL version 5.6, 5.7, or 8.0. For more information, see [Upgrading a MySQL DB snapshot \(p. 872\)](#).
- If you cannot upgrade your instance or change the `optimizer_switch` parameter, you can work around the bug by explicitly identifying an index for the query, for example:

```
SELECT * FROM table1
USE INDEX covering_index
WHERE indexed_col1 = 'value1' AND indexed_col2 = 'value2';
```

For more information, go to [Index merge optimization](#).

## Log file size

For MySQL, there is a size limit on BLOBs written to the redo log. To account for this limit, ensure that the `innodb_log_file_size` parameter for your MySQL DB instance is 10 times larger than the largest BLOB data size found in your tables, plus the length of other variable length fields (`VARCHAR`, `VARBINARY`, `TEXT`) in the same tables. For information on how to set parameter values, see [Working with DB parameter groups \(p. 229\)](#). For information on the redo log BLOB size limit, go to [Changes in MySQL 5.6.20](#).

## MySQL parameter exceptions for Amazon RDS DB instances

Some MySQL parameters require special considerations when used with an Amazon RDS DB instance.

### [lower\\_case\\_table\\_names](#)

Because Amazon RDS uses a case-sensitive file system, setting the value of the `lower_case_table_names` server parameter to 2 ("names stored as given but compared in lowercase") is not supported. The following are the supported values for Amazon RDS for MySQL DB instances:

- 0 ("names stored as given and comparisons are case-sensitive") is supported for all Amazon RDS for MySQL versions.
- 1 ("names stored in lowercase and comparisons are not case-sensitive") is supported for Amazon RDS for MySQL version 5.5, version 5.6, version 5.7, and version 8.0.19 and higher 8.0 versions.

The `lower_case_table_names` parameter should be set as part of a custom DB parameter group before creating a DB instance. You should avoid changing the `lower_case_table_names` parameter for existing database instances because doing so could cause inconsistencies with point-in-time recovery backups and read replica DB instances.

Read replicas should always use the same `lower_case_table_names` parameter value as the source DB instance.

### [long\\_query\\_time](#)

You can set the `long_query_time` parameter to a floating point value which allows you to log slow queries to the MySQL slow query log with microsecond resolution. You can set a value such as 0.1

seconds, which would be 100 milliseconds, to help when debugging slow transactions that take less than one second.

## MySQL file size limits in Amazon RDS

For MySQL DB instances, the maximum provisioned storage limit constrains the size of a table to a maximum size of 16 TB when using InnoDB file-per-table tablespaces. This limit also constrains the system tablespace to a maximum size of 16 TB. InnoDB file-per-table tablespaces (with tables each in their own tablespace) is set by default for MySQL DB instances.

### Note

Some existing DB instances have a lower limit. For example, MySQL DB instances created before April 2014 have a file and table size limit of 2 TB. This 2 TB file size limit also applies to DB instances or read replicas created from DB snapshots taken before April 2014, regardless of when the DB instance was created.

There are advantages and disadvantages to using InnoDB file-per-table tablespaces, depending on your application. To determine the best approach for your application, go to [File-per-table tablespaces](#) in the MySQL documentation.

We don't recommend allowing tables to grow to the maximum file size. In general, a better practice is to partition data into smaller tables, which can improve performance and recovery times.

One option that you can use for breaking a large table up into smaller tables is partitioning. Partitioning distributes portions of your large table into separate files based on rules that you specify. For example, if you store transactions by date, you can create partitioning rules that distribute older transactions into separate files using partitioning. Then periodically, you can archive the historical transaction data that doesn't need to be readily available to your application. For more information, go to [Partitioning](#) in the MySQL documentation.

### To determine the file size of a table

- Use the following SQL command to determine if any of your tables are too large and are candidates for partitioning.

```
SELECT TABLE_SCHEMA, TABLE_NAME,
round(((DATA_LENGTH + INDEX_LENGTH) / 1024 / 1024), 2) As "Approximate size (MB)"
FROM information_schema.TABLES
WHERE TABLE_SCHEMA NOT IN ('mysql', 'information_schema', 'performance_schema');
```

### To enable InnoDB file-per-table tablespaces

- To enable InnoDB file-per-table tablespaces, set the *innodb\_file\_per\_table* parameter to 1 in the parameter group for the DB instance.

### To disable InnoDB file-per-table tablespaces

- To disable InnoDB file-per-table tablespaces, set the *innodb\_file\_per\_table* parameter to 0 in the parameter group for the DB instance.

For information on updating a parameter group, see [Working with DB parameter groups \(p. 229\)](#).

When you have enabled or disabled InnoDB file-per-table tablespaces, you can issue an `ALTER TABLE` command to move a table from the global tablespace to its own tablespace, or from its own tablespace to the global tablespace as shown in the following example:

```
ALTER TABLE table_name ENGINE=InnoDB;
```

## MySQL Keyring Plugin not supported

Currently, Amazon RDS for MySQL does not support the MySQL `keyring_aws` Amazon Web Services Keyring Plugin.

# MySQL on Amazon RDS SQL reference

This appendix describes system stored procedures that are available for Amazon RDS instances running the MySQL DB engine.

## Overview

The following system stored procedures are supported for Amazon RDS DB instances running MySQL.

### Replication

- [mysql.rds\\_set\\_master\\_auto\\_position \(p. 963\)](#)
- [mysql.rds\\_set\\_external\\_master \(p. 964\)](#)
- [mysql.rds\\_set\\_external\\_master\\_with\\_delay \(p. 966\)](#)
- [mysql.rds\\_set\\_external\\_master\\_with\\_auto\\_position \(p. 969\)](#)
- [mysql.rds\\_reset\\_external\\_master \(p. 971\)](#)
- [mysql.rds\\_import\\_binlog\\_ssl\\_material \(p. 972\)](#)
- [mysql.rds\\_remove\\_binlog\\_ssl\\_material \(p. 973\)](#)
- [mysql.rds\\_set\\_source\\_delay \(p. 974\)](#)
- [mysql.rds\\_start\\_replication \(p. 974\)](#)
- [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#)
- [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#)
- [mysql.rds\\_stop\\_replication \(p. 977\)](#)
- [mysql.rds\\_skip\\_transaction\\_with\\_gtid \(p. 978\)](#)
- [mysql.rds\\_skip\\_repl\\_error \(p. 978\)](#)
- [mysql.rds\\_next\\_master\\_log \(p. 979\)](#)

### InnoDB cache warming

- [mysql.rds\\_innodb\\_buffer\\_pool\\_dump\\_now \(p. 981\)](#)
- [mysql.rds\\_innodb\\_buffer\\_pool\\_load\\_now \(p. 981\)](#)
- [mysql.rds\\_innodb\\_buffer\\_pool\\_load\\_abort \(p. 982\)](#)

### Managing additional configuration (for example, binlog file retention)

- [mysql.rds\\_set\\_configuration \(p. 982\)](#)
- [mysql.rds\\_show\\_configuration \(p. 984\)](#)

### Ending a session or query

- [mysql.rds\\_kill \(p. 984\)](#)
- [mysql.rds\\_kill\\_query \(p. 985\)](#)

### Logging

- [mysql.rds\\_rotate\\_general\\_log \(p. 985\)](#)
- [mysql.rds\\_rotate\\_slow\\_log \(p. 986\)](#)

### Managing the global status history

- [mysql.rds\\_enable\\_gsh\\_collector \(p. 986\)](#)
- [mysql.rds\\_set\\_gsh\\_collector \(p. 986\)](#)
- [mysql.rds\\_disable\\_gsh\\_collector \(p. 987\)](#)
- [mysql.rds\\_collect\\_global\\_status\\_history \(p. 987\)](#)
- [mysql.rds\\_enable\\_gsh\\_rotation \(p. 987\)](#)
- [mysql.rds\\_set\\_gsh\\_rotation \(p. 987\)](#)
- [mysql.rds\\_disable\\_gsh\\_rotation \(p. 987\)](#)
- [mysql.rds\\_rotate\\_global\\_status\\_history \(p. 988\)](#)

## SQL reference conventions

Following, you can find explanations for the conventions that are used to describe the syntax of the system stored procedures and tables described in the SQL reference section.

Character	Description
UPPERCASE	Words in uppercase are keywords.
[ ]	Square brackets indicate optional arguments.
{ }	Braces indicate that you are required to choose one of the arguments inside the braces.
	Pipes separate arguments that you can choose.
<i>italics</i>	Words in italics indicate placeholders. You must insert the appropriate value in place of the word in italics.
...	An ellipsis indicates that you can repeat the preceding element.
'	Words in single quotes indicate that you must type the quotes.

## mysql.rds\_set\_master\_auto\_position

Sets the replication mode to be based on either binary log file positions or on global transaction identifiers (GTIDs).

### Syntax

```
CALL mysql.rds_set_master_auto_position (
 auto_position_mode
);
```

### Parameters

*auto\_position\_mode*

A value that indicates whether to use log file position replication or GTID-based replication:

- 0 – Use the replication method based on binary log file position. The default is 0.

- 1 – Use the GTID-based replication method.

## Usage notes

The master user must run the `mysql.rds_set_master_auto_position` procedure.

For RDS for MySQL 5.7, this procedure is supported for MySQL 5.7.23 and later MySQL 5.7 versions. This procedure is not supported for RDS for MySQL 5.5, 5.6, or 8.0.

## mysql.rds\_set\_external\_master

Configures a MySQL DB instance to be a read replica of an instance of MySQL running external to Amazon RDS.

### Important

To run this procedure, `autocommit` must be enabled. To enable it, set the `autocommit` parameter to 1. For information about modifying parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

### Note

You can use the [mysql.rds\\_set\\_external\\_master\\_with\\_delay \(p. 966\)](#) stored procedure to configure an external source database instance and delayed replication.

## Syntax

```
CALL mysql.rds_set_external_master (
 host_name
, host_port
, replication_user_name
, replication_user_password
, mysql_binary_log_file_name
, mysql_binary_log_file_location
, ssl_encryption
);
```

## Parameters

### *host\_name*

The host name or IP address of the MySQL instance running external to Amazon RDS to become the source database instance.

### *host\_port*

The port used by the MySQL instance running external to Amazon RDS to be configured as the source database instance. If your network configuration includes Secure Shell (SSH) port replication that converts the port number, specify the port number that is exposed by SSH.

### *replication\_user\_name*

The ID of a user with `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the MySQL instance running external to Amazon RDS. We recommend that you provide an account that is used solely for replication with the external instance.

### *replication\_user\_password*

The password of the user ID specified in `replication_user_name`.

*mysql\_binary\_log\_file\_name*

The name of the binary log on the source database instance that contains the replication information.

*mysql\_binary\_log\_file\_location*

The location in the `mysql_binary_log_file_name` binary log at which replication starts reading the replication information.

*ssl\_encryption*

A value that specifies whether Secure Socket Layer (SSL) encryption is used on the replication connection. 1 specifies to use SSL encryption, 0 specifies to not use encryption. The default is 0.

**Note**

The `MASTER_SSL_VERIFY_SERVER_CERT` option isn't supported. This option is set to 0, which means that the connection is encrypted, but the certificates aren't verified.

## Usage notes

The master user must run the `mysql.rds_set_external_master` procedure. This procedure must be run on the MySQL DB instance to be configured as the read replica of a MySQL instance running external to Amazon RDS.

Before you run `mysql.rds_set_external_master`, you must configure the instance of MySQL running external to Amazon RDS to be a source database instance. To connect to the MySQL instance running external to Amazon RDS, you must specify `replication_user_name` and `replication_user_password` values that indicate a replication user that has `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the external instance of MySQL.

### To configure an external instance of MySQL as a source database instance

1. Using the MySQL client of your choice, connect to the external instance of MySQL and create a user account to be used for replication. The following is an example.

**MySQL 5.5, 5.6, and 5.7**

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED BY 'password';
```

**MySQL 8.0**

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED WITH mysql_native_password BY 'password';
```

2. On the external instance of MySQL, grant `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges to your replication user. The following example grants `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges on all databases for the 'repl\_user' user for your domain.

**MySQL 5.5, 5.6, and 5.7**

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com' IDENTIFIED BY 'password';
```

**MySQL 8.0**

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com' ;
```

To use encrypted replication, configure source database instance to use SSL connections. Also, import the certificate authority certificate, client certificate, and client key into the DB instance or DB cluster using the [mysql.rds\\_import\\_binlog\\_ssl\\_material \(p. 972\)](#) procedure.

**Note**

We recommend that you use read replicas to manage replication between two Amazon RDS DB instances when possible. When you do so, we recommend that you use only this and other replication-related stored procedures. These practices enable more complex replication topologies between Amazon RDS DB instances. We offer these stored procedures primarily to enable replication with MySQL instances running external to Amazon RDS. For information about managing replication between Amazon RDS DB instances, see [Working with read replicas \(p. 279\)](#).

After calling `mysql.rds_set_external_master` to configure an Amazon RDS DB instance as a read replica, you can call [mysql.rds\\_start\\_replication \(p. 974\)](#) on the read replica to start the replication process. You can call [mysql.rds\\_reset\\_external\\_master \(p. 971\)](#) to remove the read replica configuration.

When `mysql.rds_set_external_master` is called, Amazon RDS records the time, user, and an action of `set master` in the `mysql.rds_history` and `mysql.rds_replication_status` tables.

## Examples

When run on a MySQL DB instance, the following example configures the DB instance to be a read replica of an instance of MySQL running external to Amazon RDS.

```
call mysql.rds_set_external_master(
 'Externaldb.some.com',
 3306,
 'repl_user',
 'password',
 'mysql-bin-changelog.0777',
 120,
 0);
```

## mysql.rds\_set\_external\_master\_with\_delay

Configures an RDS for MySQL DB instance to be a read replica of an instance of MySQL running external to Amazon RDS and configures delayed replication.

**Important**

To run this procedure, `autocommit` must be enabled. To enable it, set the `autocommit` parameter to 1. For information about modifying parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

## Syntax

```
CALL mysql.rds_set_external_master_with_delay (
 host_name
, host_port
, replication_user_name
, replication_user_password
, mysql_binary_log_file_name
, mysql_binary_log_file_location
, ssl_encryption
, delay
);
```

## Parameters

### *host\_name*

The host name or IP address of the MySQL instance running external to Amazon RDS that will become the source database instance.

### *host\_port*

The port used by the MySQL instance running external to Amazon RDS to be configured as the source database instance. If your network configuration includes SSH port replication that converts the port number, specify the port number that is exposed by SSH.

### *replication\_user\_name*

The ID of a user with `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the MySQL instance running external to Amazon RDS. We recommend that you provide an account that is used solely for replication with the external instance.

### *replication\_user\_password*

The password of the user ID specified in `replication_user_name`.

### *mysql\_binary\_log\_file\_name*

The name of the binary log on the source database instance contains the replication information.

### *mysql\_binary\_log\_file\_location*

The location in the `mysql_binary_log_file_name` binary log at which replication will start reading the replication information.

### *ssl\_encryption*

A value that specifies whether Secure Socket Layer (SSL) encryption is used on the replication connection. 1 specifies to use SSL encryption, 0 specifies to not use encryption. The default is 0.

#### **Note**

The `MASTER_SSL_VERIFY_SERVER_CERT` option isn't supported. This option is set to 0, which means that the connection is encrypted, but the certificates aren't verified.

### *delay*

The minimum number of seconds to delay replication from source database instance.

The limit for this parameter is one day (86400 seconds).

## Usage notes

The master user must run the `mysql.rds_set_external_master_with_delay` procedure. This procedure must be run on the MySQL DB instance to be configured as the read replica of a MySQL instance running external to Amazon RDS.

Before you run `mysql.rds_set_external_master_with_delay`, you must configure the instance of MySQL running external to Amazon RDS to be a source database instance. To connect to the MySQL instance running external to Amazon RDS, you must specify values for `replication_user_name` and `replication_user_password`. These values must indicate a replication user that has `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the external instance of MySQL.

### To configure an external instance of MySQL as a source database instance

1. Using the MySQL client of your choice, connect to the external instance of MySQL and create a user account to be used for replication. The following is an example.

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED BY 'SomePassW0rd'
```

2. On the external instance of MySQL, grant REPLICATION CLIENT and REPLICATION SLAVE privileges to your replication user. The following example grants REPLICATION CLIENT and REPLICATION SLAVE privileges on all databases for the 'repl\_user' user for your domain.

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com'
IDENTIFIED BY 'SomePassW0rd'
```

For more information, see [Replication with a MySQL or MariaDB instance running external to Amazon RDS \(p. 924\)](#).

**Note**

We recommend that you use read replicas to manage replication between two Amazon RDS DB instances when possible. When you do so, we recommend that you use only this and other replication-related stored procedures. These practices enable more complex replication topologies between Amazon RDS DB instances. We offer these stored procedures primarily to enable replication with MySQL instances running external to Amazon RDS. For information about managing replication between Amazon RDS DB instances, see [Working with read replicas \(p. 279\)](#).

After calling `mysql.rds_set_external_master_with_delay` to configure an Amazon RDS DB instance as a read replica, you can call [mysql.rds\\_start\\_replication \(p. 974\)](#) on the read replica to start the replication process. You can call [mysql.rds\\_reset\\_external\\_master \(p. 971\)](#) to remove the read replica configuration.

When you call `mysql.rds_set_external_master_with_delay`, Amazon RDS records the time, the user, and an action of `set master` in the `mysql.rds_history` and `mysql.rds_replication_status` tables.

For disaster recovery, you can use this procedure with the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) or [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure. To roll forward changes to a delayed read replica to the time just before a disaster, you can run the `mysql.rds_set_external_master_with_delay` procedure. After the `mysql.rds_start_replication_until` procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

To use the `mysql.rds_start_replication_until_gtid` procedure, GTID-based replication must be enabled. To skip a specific GTID-based transaction that is known to cause disaster, you can use the [mysql.rds\\_skip\\_transaction\\_with\\_gtid \(p. 978\)](#) stored procedure. For more information about working with GTID-based replication, see [Using GTID-based replication for RDS for MySQL \(p. 919\)](#).

The `mysql.rds_set_external_master_with_delay` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6.40 and later 5.6 versions
- MySQL 5.7.22 and later 5.7 versions

## Examples

When run on a MySQL DB instance, the following example configures the DB instance to be a read replica of an instance of MySQL running external to Amazon RDS. It sets the minimum replication delay to one hour (3,600 seconds) on the MySQL DB instance. A change from the MySQL source database instance running external to Amazon RDS is not applied on the MySQL DB instance read replica for at least one hour.

```
call mysql.rds_set_external_master_with_delay(
 'Externalaldb.some.com',
 3306,
 'repl_user',
 'SomePassW0rd',
 'mysql-bin-changelog.000777',
 120,
 0,
 3600);
```

## mysql.rds\_set\_external\_master\_with\_auto\_position

Configures an RDS for MySQL DB instance to be a read replica of an instance of MySQL running external to Amazon RDS. This procedure also configures delayed replication and replication based on global transaction identifiers (GTIDs).

### Important

To run this procedure, `autocommit` must be enabled. To enable it, set the `autocommit` parameter to 1. For information about modifying parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

## Syntax

```
CALL mysql.rds_set_external_master_with_auto_position (
 host_name
, host_port
, replication_user_name
, replication_user_password
, ssl_encryption
, delay
);
```

## Parameters

### *host\_name*

The host name or IP address of the MySQL instance running external to Amazon RDS to become the source database instance.

### *host\_port*

The port used by the MySQL instance running external to Amazon RDS to be configured as the source database instance. If your network configuration includes Secure Shell (SSH) port replication that converts the port number, specify the port number that is exposed by SSH.

### *replication\_user\_name*

The ID of a user with `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the MySQL instance running external to Amazon RDS. We recommend that you provide an account that is used solely for replication with the external instance.

### *replication\_user\_password*

The password of the user ID specified in `replication_user_name`.

### *ssl\_encryption*

A value that specifies whether Secure Socket Layer (SSL) encryption is used on the replication connection. 1 specifies to use SSL encryption, 0 specifies to not use encryption. The default is 0.

**Note**

The `MASTER_SSL_VERIFY_SERVER_CERT` option isn't supported. This option is set to 0, which means that the connection is encrypted, but the certificates aren't verified.

*delay*

The minimum number of seconds to delay replication from source database instance.

The limit for this parameter is one day (86,400 seconds).

## Usage notes

The master user must run the `mysql.rds_set_external_master_with_auto_position` procedure. This procedure must be run on the MySQL DB instance to be configured as the read replica of a MySQL instance running external to Amazon RDS.

For RDS for MySQL 5.7, this procedure is supported for MySQL 5.7.23 and later MySQL 5.7 versions. This procedure is not supported for RDS for MySQL 5.5, 5.6, or 8.0.

Before you run `mysql.rds_set_external_master_with_auto_position`, you must configure the instance of MySQL running external to Amazon RDS to be a source database instance. To connect to the MySQL instance running external to Amazon RDS, you must specify values for `replication_user_name` and `replication_user_password`. These values must indicate a replication user that has `REPLICATION CLIENT` and `REPLICATION SLAVE` permissions on the external instance of MySQL.

### To configure an external instance of MySQL as a source database instance

1. Using the MySQL client of your choice, connect to the external instance of MySQL and create a user account to be used for replication. The following is an example.

```
CREATE USER 'repl_user'@'mydomain.com' IDENTIFIED BY 'SomePassW0rd'
```

2. On the external instance of MySQL, grant `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges to your replication user. The following example grants `REPLICATION CLIENT` and `REPLICATION SLAVE` privileges on all databases for the '`repl_user`' user for your domain.

```
GRANT REPLICATION CLIENT, REPLICATION SLAVE ON *.* TO 'repl_user'@'mydomain.com'
IDENTIFIED BY 'SomePassWord'
```

For more information, see [Replication with a MySQL or MariaDB instance running external to Amazon RDS \(p. 924\)](#).

**Note**

We recommend that you use read replicas to manage replication between two Amazon RDS DB instances when possible. When you do so, we recommend that you use only this and other replication-related stored procedures. These practices enable more complex replication topologies between Amazon RDS DB instances. We offer these stored procedures primarily to enable replication with MySQL instances running external to Amazon RDS. For information about managing replication between Amazon RDS DB instances, see [Working with read replicas \(p. 279\)](#).

After calling `mysql.rds_set_external_master_with_auto_position` to configure an Amazon RDS DB instance as a read replica, you can call [mysql.rds\\_start\\_replication \(p. 974\)](#) on the read replica to start the replication process. You can call [mysql.rds\\_reset\\_external\\_master \(p. 971\)](#) to remove the read replica configuration.

When you call `mysql.rds_set_external_master_with_auto_position`, Amazon RDS records the time, the user, and an action of `set master` in the `mysql.rds_history` and `mysql.rds_replication_status` tables.

For disaster recovery, you can use this procedure with the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) or [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure. To roll forward changes to a delayed read replica to the time just before a disaster, you can run the `mysql.rds_set_external_master_with_auto_position` procedure. After the `mysql.rds_start_replication_until_gtid` procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

To use the `mysql.rds_start_replication_until_gtid` procedure, GTID-based replication must be enabled. To skip a specific GTID-based transaction that is known to cause disaster, you can use the [mysql.rds\\_skip\\_transaction\\_with\\_gtid \(p. 978\)](#) stored procedure. For more information about working with GTID-based replication, see [Using GTID-based replication for RDS for MySQL \(p. 919\)](#).

## Examples

When run on a MySQL DB instance, the following example configures the DB instance to be a read replica of an instance of MySQL running external to Amazon RDS. It sets the minimum replication delay to one hour (3,600 seconds) on the MySQL DB instance. A change from the MySQL source database instance running external to Amazon RDS is not applied on the MySQL DB instance read replica for at least one hour.

```
call mysql.rds_set_external_master_with_auto_position(
 'Externaldb.some.com',
 3306,
 'repl_user',
 'SomePassw0rd',
 0,
 3600);
```

## mysql.rds\_reset\_external\_master

Reconfigures a MySQL DB instance to no longer be a read replica of an instance of MySQL running external to Amazon RDS.

### Important

To run this procedure, `autocommit` must be enabled. To enable it, set the `autocommit` parameter to 1. For information about modifying parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

## Syntax

```
CALL mysql.rds_reset_external_master;
```

## Usage notes

The master user must run the `mysql.rds_reset_external_master` procedure. This procedure must be run on the MySQL DB instance to be removed as a read replica of a MySQL instance running external to Amazon RDS.

### Note

We recommend that you use read replicas to manage replication between two Amazon RDS DB instances when possible. When you do so, we recommend that you use only this and other replication-related stored procedures. These practices enable more complex replication

topologies between Amazon RDS DB instances. We offer these stored procedures primarily to enable replication with MySQL instances running external to Amazon RDS. For information about managing replication between Amazon RDS DB instances, see [Working with read replicas \(p. 279\)](#).

For more information about using replication to import data from an instance of MySQL running external to Amazon RDS, see [Restoring a backup into a MySQL DB instance \(p. 880\)](#).

## mysql.rds\_import\_binlog\_ssl\_material

Imports the certificate authority certificate, client certificate, and client key into an Aurora MySQL DB cluster. The information is required for SSL communication and encrypted replication.

### Note

Currently, this procedure is only supported for Aurora MySQL version 5.6.

## Syntax

```
CALL mysql.rds_import_binlog_ssl_material (
 ssl_material
);
```

## Parameters

### *ssl\_material*

JSON payload that contains the contents of the following .pem format files for a MySQL client:

- "ssl\_ca": "*Certificate authority certificate*"
- "ssl\_cert": "*Client certificate*"
- "ssl\_key": "*Client key*"

## Usage notes

Prepare for encrypted replication before you run this procedure:

- If you don't have SSL enabled on the external MySQL source database instance and don't have a client key and client certificate prepared, enable SSL on the MySQL database server and generate the required client key and client certificate.
- If SSL is enabled on the external source database instance, supply a client key and certificate for the Aurora MySQL DB cluster. If you don't have these, generate a new key and certificate for the Aurora MySQL DB cluster. To sign the client certificate, you must have the certificate authority key you used to configure SSL on the external MySQL source database instance.

For more information, see [Creating SSL certificates and keys using openssl](#) in the MySQL documentation.

### Important

After you prepare for encrypted replication, use an SSL connection to run this procedure. The client key must not be transferred across an insecure connection.

This procedure imports SSL information from an external MySQL database into an Aurora MySQL DB cluster. The SSL information is in .pem format files that contain the SSL information for the Aurora MySQL DB cluster. During encrypted replication, the Aurora MySQL DB cluster acts a client to the MySQL database server. The certificates and keys for the Aurora MySQL client are in files in .pem format.

You can copy the information from these files into the `ssl_material` parameter in the correct JSON payload. To support encrypted replication, import this SSL information into the Aurora MySQL DB cluster.

The JSON payload must be in the following format.

```
'{"ssl_ca":"-----BEGIN CERTIFICATE-----
ssl_ca_pem_body_code
-----END CERTIFICATE-----\n","ssl_cert":"-----BEGIN CERTIFICATE-----
ssl_cert_pem_body_code
-----END CERTIFICATE-----\n","ssl_key":"-----BEGIN RSA PRIVATE KEY-----
ssl_key_pem_body_code
-----END RSA PRIVATE KEY-----\n"}'
```

## Examples

The following example imports SSL information into an Aurora MySQL DB cluster. In .pem format files, the body code typically is longer than the body code shown in the example.

```
call mysql.rds_import_binlog_ssl_material(
'{"ssl_ca":"-----BEGIN CERTIFICATE-----
AAAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V

-----END RSA PRIVATE KEY-----\n"}');
```

### Note

For information about using Amazon Aurora, see the [Amazon Aurora User Guide](#).

## mysql.rds\_remove\_binlog\_ssl\_material

Removes the certificate authority certificate, client certificate, and client key for SSL communication and encrypted replication. This information is imported by using [mysql.rds\\_import\\_binlog\\_ssl\\_material \(p. 972\)](#).

### Note

Currently, this procedure is only supported for Aurora MySQL version 5.6.

## Syntax

```
CALL mysql.rds_remove_binlog_ssl_material;
```

## mysql.rds\_set\_source\_delay

Sets the minimum number of seconds to delay replication from source database instance to the current read replica. Use this procedure when you are connected to a read replica to delay replication from its source database instance.

### Syntax

```
CALL mysql.rds_set_source_delay(
 delay
)
```

### Parameters

*delay*

The minimum number of seconds to delay replication from the source database instance.

The limit for this parameter is one day (86400 seconds).

### Usage notes

The master user must run the `mysql.rds_set_source_delay` procedure.

For disaster recovery, you can use this procedure with the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure or the [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure. To roll forward changes to a delayed read replica to the time just before a disaster, you can run the `mysql.rds_set_source_delay` procedure. After the `mysql.rds_start_replication_until` or `mysql.rds_start_replication_until_gtid` procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

To use the `mysql.rds_start_replication_until_gtid` procedure, GTID-based replication must be enabled. To skip a specific GTID-based transaction that is known to cause disaster, you can use the [mysql.rds\\_skip\\_transaction\\_with\\_gtid \(p. 978\)](#) stored procedure. For more information on GTID-based replication, see [Using GTID-based replication for RDS for MySQL \(p. 919\)](#).

The `mysql.rds_set_source_delay` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6.40 and later 5.6 versions
- MySQL 5.7.22 and later 5.7 versions

### Examples

To delay replication from source database instance to the current read replica for at least one hour (3,600 seconds), you can call `mysql.rds_set_source_delay` with the following parameter:

```
CALL mysql.rds_set_source_delay(3600);
```

## mysql.rds\_start\_replication

Initiates replication from a MySQL DB instance.

### Note

You can use the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) or [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure to initiate replication from an RDS for MySQL DB instance and stop replication at the specified binary log file location.

## Syntax

```
CALL mysql.rds_start_replication;
```

## Usage notes

The master user must run the `mysql.rds_start_replication` procedure.

If you are configuring replication to import data from an instance of MySQL running external to Amazon RDS, you call `mysql.rds_start_replication` on the read replica to start the replication process after you have called [mysql.rds\\_set\\_external\\_master \(p. 964\)](#) to build the replication configuration. For more information, see [Restoring a backup into a MySQL DB instance \(p. 880\)](#).

If you are configuring replication to export data to an instance of MySQL external to Amazon RDS, you call `mysql.rds_start_replication` and `mysql.rds_stop_replication` on the read replica to control some replication actions, such as purging binary logs. For more information, see [Exporting data from a MySQL DB instance by using replication \(p. 930\)](#).

You can also call `mysql.rds_start_replication` on the read replica to restart any replication process that you previously stopped by calling [mysql.rds\\_stop\\_replication \(p. 977\)](#). For more information, see [Working with read replicas \(p. 279\)](#).

## mysql.rds\_start\_replication\_until

Initiates replication from an RDS for MySQL DB instance and stops replication at the specified binary log file location.

## Syntax

```
CALL mysql.rds_start_replication_until (
 replication_log_file
 , replication_stop_point
);
```

## Parameters

*replication\_log\_file*

The name of the binary log on the source database instance contains the replication information.

*replication\_stop\_point*

The location in the `replication_log_file` binary log at which replication will stop.

## Usage notes

The master user must run the `mysql.rds_start_replication_until` procedure.

You can use this procedure with delayed replication for disaster recovery. If you have delayed replication configured, you can use this procedure to roll forward changes to a delayed read replica to the time

just before a disaster. After this procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

You can configure delayed replication using the following stored procedures:

- [mysql.rds\\_set\\_configuration \(p. 982\)](#)
- [mysql.rds\\_set\\_external\\_master\\_with\\_delay \(p. 966\)](#)
- [mysql.rds\\_set\\_source\\_delay \(p. 974\)](#)

The file name specified for the `replication_log_file` parameter must match the source database instance binlog file name.

When the `replication_stop_point` parameter specifies a stop location that is in the past, replication is stopped immediately.

The `mysql.rds_start_replication_until` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6.40 and later 5.6 versions
- MySQL 5.7.22 and later 5.7 versions

## Examples

The following example initiates replication and replicates changes until it reaches location 120 in the `mysql-bin-changelog.000777` binary log file.

```
call mysql.rds_start_replication_until(
 'mysql-bin-changelog.000777',
 120);
```

## mysql.rds\_start\_replication\_until\_gtid

Initiates replication from an RDS for MySQL DB instance and stops replication immediately after the specified global transaction identifier (GTID).

## Syntax

```
CALL mysql.rds_start_replication_until_gtid (
 gtid
);
```

## Parameters

*gtid*

The GTID after which replication is to stop.

## Usage notes

The master user must run the `mysql.rds_start_replication_until_gtid` procedure.

For RDS for MySQL 5.7, this procedure is supported for MySQL 5.7.23 and later MySQL 5.7 versions. This procedure is not supported for RDS for MySQL 5.5, 5.6, or 8.0.

You can use this procedure with delayed replication for disaster recovery. If you have delayed replication configured, you can use this procedure to roll forward changes to a delayed read replica to the time just before a disaster. After this procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

You can configure delayed replication using the following stored procedures:

- [mysql.rds\\_set\\_configuration \(p. 982\)](#)
- [mysql.rds\\_set\\_external\\_master\\_with\\_auto\\_position \(p. 969\)](#)
- [mysql.rds\\_set\\_source\\_delay \(p. 974\)](#)

When the `gtid` parameter specifies a transaction that has already been run by the replica, replication is stopped immediately.

## Examples

The following example initiates replication and replicates changes until it reaches GTID `3E11FA47-71CA-11E1-9E33-C80AA9429562:23`.

```
call mysql.rds_start_replication_until_gtid('3E11FA47-71CA-11E1-9E33-C80AA9429562:23');
```

## mysql.rds\_stop\_replication

Stops replication from a MySQL DB instance.

## Syntax

```
CALL mysql.rds_stop_replication;
```

## Usage notes

The master user must run the `mysql.rds_stop_replication` procedure.

If you are configuring replication to import data from an instance of MySQL running external to Amazon RDS, you call `mysql.rds_stop_replication` on the read replica to stop the replication process after the import has completed. For more information, see [Restoring a backup into a MySQL DB instance \(p. 880\)](#).

If you are configuring replication to export data to an instance of MySQL external to Amazon RDS, you call `mysql.rds_start_replication` and `mysql.rds_stop_replication` on the read replica to control some replication actions, such as purging binary logs. For more information, see [Exporting data from a MySQL DB instance by using replication \(p. 930\)](#).

You can also use `mysql.rds_stop_replication` to stop replication between two Amazon RDS DB instances. You typically stop replication to perform a long running operation on the read replica, such as creating a large index on the read replica. You can restart any replication process that you stopped by calling [mysql.rds\\_start\\_replication \(p. 974\)](#) on the read replica. For more information, see [Working with read replicas \(p. 279\)](#).

## mysql.rds\_skip\_transaction\_with\_gtid

Skips replication of a transaction with the specified global transaction identifier (GTID) on a MySQL DB instance.

You can use this procedure for disaster recovery when a specific GTID transaction is known to cause a problem. Use this stored procedure to skip the problematic transaction. Examples of problematic transactions include transactions that disable replication, delete important data, or cause the DB instance to become unavailable.

### Syntax

```
CALL mysql.rds_skip_transaction_with_gtid (
 gtid_to_skip
);
```

### Parameters

*gtid\_to\_skip*

The GTID of the replication transaction to skip.

### Usage notes

The master user must run the `mysql.rds_skip_transaction_with_gtid` procedure.

For RDS for MySQL 5.7, this procedure is supported for MySQL 5.7.23 and later MySQL 5.7 versions. This procedure is not supported for RDS for MySQL 5.5, 5.6, or 8.0.

### Examples

The following example skips replication of the transaction with the GTID `3E11FA47-71CA-11E1-9E33-C80AA9429562:23`.

```
call mysql.rds_skip_transaction_with_gtid('3E11FA47-71CA-11E1-9E33-C80AA9429562:23');
```

## mysql.rds\_skip\_repl\_error

Skips and deletes a replication error on a MySQL DB instance.

### Syntax

```
CALL mysql.rds_skip_repl_error;
```

### Usage notes

The master user must run the `mysql.rds_skip_repl_error` procedure.

To determine if there are errors, run the MySQL `SHOW REPLICAS STATUS\G` command. If a replication error isn't critical, you can run `mysql.rds_skip_repl_error` to skip the error. If there are multiple errors, `mysql.rds_skip_repl_error` deletes the first error, then warns that others are present. You

can then use `SHOW REPLICAS STATUS\G` to determine the correct course of action for the next error. For information about the values returned, see [the MySQL documentation](#).

**Note**

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

For more information about addressing replication errors with Amazon RDS, see [Troubleshooting a MySQL read replica problem \(p. 918\)](#).

**Important**

If you try to call `mysql.rds_skip_repl_error`, you might encounter the following error:  
`ERROR 1305 (42000): PROCEDURE mysql.rds_skip_repl_error does not exist.`  
If you do, upgrade your MySQL DB instance to the latest minor version or one of the minimum minor versions listed in this topic.

## Replication stopped error

When you call the `mysql.rds_skip_repl_error` command, you might receive an error message stating that the replica is down or disabled.

This error message appears because replication has stopped and could not be restarted.

If you need to skip a large number of errors, the replication lag can increase beyond the default retention period for binary log (binlog) files. In this case, you might encounter a fatal error due to binlog files being purged before they have been replayed on the read replica. This purge causes replication to stop, and you can no longer call the `mysql.rds_skip_repl_error` command to skip replication errors.

You can mitigate this issue by increasing the number of hours that binlog files are retained on your source database instance. After you have increased the binlog retention time, you can restart replication and call the `mysql.rds_skip_repl_error` command as needed.

To set the binlog retention time, use the [mysql.rds\\_set\\_configuration \(p. 982\)](#) procedure and specify a configuration parameter of 'binlog retention hours' along with the number of hours to retain binlog files on the DB cluster. The following example sets the retention period for binlog files to 48 hours.

```
CALL mysql.rds_set_configuration('binlog retention hours', 48);
```

## mysql.rds\_next\_master\_log

Changes the source database instance log position to the start of the next binary log on the source database instance. Use this procedure only if you are receiving replication I/O error 1236 on a read replica.

### Syntax

```
CALL mysql.rds_next_master_log(
curr_master_log
);
```

### Parameters

*curr\_master\_log*

The index of the current master log file. For example, if the current file is named `mysql-bin-changelog.012345`, then the index is 12345. To determine the current master log file name, run the `SHOW REPLICAS STATUS` command and view the `Master_Log_File` field.

**Note**

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICA STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

## Usage notes

The master user must run the `mysql.rds_next_master_log` procedure.

**Warning**

Call `mysql.rds_next_master_log` only if replication fails after a failover of a Multi-AZ DB instance that is the replication source, and the `Last_IO_Errno` field of `SHOW REPLICA STATUS` reports I/O error 1236.

Calling `mysql.rds_next_master_log` may result in data loss in the read replica if transactions in the source instance were not written to the binary log on disk before the failover event occurred. You can reduce the chance of this happening by configuring the source instance parameters `sync_binlog = 1` and `innodb_support_xa = 1`, although this may reduce performance. For more information, see [Working with read replicas \(p. 279\)](#).

## Examples

Assume replication fails on an Amazon RDS read replica. Running `SHOW REPLICA STATUS\G` on the read replica returns the following result:

```
***** 1. row *****
Replica_IO_State:
 Source_Host: myhostXXXXXXXXXXXXXX.rr-rrrr-1.rds.amazonaws.com
 Source_User: MasterUser
 Source_Port: 3306
 Connect_Retry: 10
 Source_Log_File: mysql-bin-changelog.012345
 Read_Source_Log_Pos: 1219393
 Relay_Log_File: relaylog.012340
 Relay_Log_Pos: 30223388
 Relay_Source_Log_File: mysql-bin-changelog.012345
 Replica_IO_Running: No
 Replica_SQL_Running: Yes
 Replicate_Do_DB:
 Replicate_Ignore_DB:
 Replicate_Do_Table:
 Replicate_Ignore_Table:
 Replicate_Wild_Do_Table:
 Replicate_Wild_Ignore_Table:
 Last_Error:
 Skip_Counter: 0
 Exec_Source_Log_Pos: 30223232
 Relay_Log_Space: 5248928866
 Until_Condition: None
 Until_Log_File:
 Until_Log_Pos: 0
 Source_SSL_Allowed: No
 Source_SSL_CA_File:
 Source_SSL_CA_Path:
 Source_SSL_Cert:
 Source_SSL_Cipher:
 Source_SSL_Key:
 Seconds_Behind_Master: NULL
 Source_SSL_Verify_Server_Cert: No
 Last_IO_Error: Got fatal error 1236 from master when reading data from
 binary log: 'Client requested master to start replication from impossible position; the
```

```
first event 'mysql-bin-changelog.013406' at 1219393, the last event read from '/rdsdbdata/
log/binlog/mysql-bin-changelog.012345' at 4, the last byte read from '/rdsdbdata/log/
binlog/mysql-bin-changelog.012345' at 4.
Last_SQL_Error:
Replicate_Ignore_Server_Ids:
Source_Server_Id: 67285976
```

The `Last_IO_Error` field shows that the instance is receiving I/O error 1236. The `Master_Log_File` field shows that the file name is `mysql-bin-changelog.012345`, which means that the log file index is 12345. To resolve the error, you can call `mysql.rds_next_master_log` with the following parameter:

```
CALL mysql.rds_next_master_log(12345);
```

#### Note

Previous versions of MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICA STATUS`. If you are using a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

## mysql.rds\_innodb\_buffer\_pool\_dump\_now

Dumps the current state of the buffer pool to disk. For more information, see [InnoDB cache warming \(p. 845\)](#).

### Syntax

```
CALL mysql.rds_innodb_buffer_pool_dump_now();
```

### Usage notes

The master user must run the `mysql.rds_innodb_buffer_pool_dump_now` procedure.

The `mysql.rds_innodb_buffer_pool_dump_now` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6
- MySQL 5.7
- MySQL 8.0

## mysql.rds\_innodb\_buffer\_pool\_load\_now

Loads the saved state of the buffer pool from disk. For more information, see [InnoDB cache warming \(p. 845\)](#).

### Syntax

```
CALL mysql.rds_innodb_buffer_pool_load_now();
```

### Usage notes

The master user must run the `mysql.rds_innodb_buffer_pool_load_now` procedure.

The `mysql.rds_innodb_buffer_pool_load_now` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6
- MySQL 5.7
- MySQL 8.0

## mysql.rds\_innodb\_buffer\_pool\_load\_abort

Cancels a load of the saved buffer pool state while in progress. For more information, see [InnoDB cache warming \(p. 845\)](#).

### Syntax

```
CALL mysql.rds_innodb_buffer_pool_load_abort();
```

### Usage notes

The master user must run the `mysql.rds_innodb_buffer_pool_load_abort` procedure.

The `mysql.rds_innodb_buffer_pool_load_abort` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6
- MySQL 5.7
- MySQL 8.0

## mysql.rds\_set\_configuration

Specifies the number of hours to retain binary logs or the number of seconds to delay replication.

### Syntax

```
CALL mysql.rds_set_configuration(name,value);
```

### Parameters

*name*

The name of the configuration parameter to set.

*value*

The value of the configuration parameter.

### Usage notes

The `mysql.rds_set_configuration` stored procedure is available in these versions of RDS for MySQL:

- MySQL 5.6

- MySQL 5.7
- MySQL 8.0

The `mysql.rds_set_configuration` procedure supports the following configuration parameters:

- [Binlog retention hours \(p. 983\)](#)
- [Target delay \(p. 983\)](#)

## Binlog retention hours

The `binlog retention hours` parameter is used to specify the number of hours to retain binary log files. Amazon RDS normally purges a binary log as soon as possible, but the binary log might still be required for replication with a MySQL database external to Amazon RDS. The default value of `binlog retention hours` is `NULL`. This default value is interpreted as follows:

- For RDS for MySQL, `NULL` means binary logs are not retained (0 hours).
- For Aurora MySQL, `NULL` means binary logs are cleaned up lazily. Aurora MySQL binary logs might remain in the system for a certain period, usually not longer than a day.

To specify the number of hours for Amazon RDS to retain binary logs on a DB instance, use the `mysql.rds_set_configuration` stored procedure and specify a period with enough time for replication to occur, as shown in the following example.

```
call mysql.rds_set_configuration('binlog retention hours', 24);
```

For MySQL DB instances, the maximum `binlog retention hours` value is 168 (7 days).

After you set the retention period, monitor storage usage for the DB instance to make sure that the retained binary logs don't take up too much storage.

## Target delay

Use the `target delay` parameter to specify the number of seconds to delay replication from source database instance to the read replica. The specified delay applies to new replicas created from the current DB instance. Amazon RDS normally replicates changes as soon as possible, but some environments might want to delay replication. For example, when replication is delayed, you can roll forward a delayed read replica to the time just before a disaster. If a table is dropped accidentally, you can use delayed replication to recover it quickly. The default value of `target delay` is 0 (don't delay replication).

For disaster recovery, you can use this configuration parameter with the [mysql.rds\\_start\\_replication\\_until \(p. 975\)](#) stored procedure or the [mysql.rds\\_start\\_replication\\_until\\_gtid \(p. 976\)](#) stored procedure. To roll forward changes to a delayed read replica to the time just before a disaster, you can run the `mysql.rds_set_configuration` procedure with this parameter set. After the `mysql.rds_start_replication_until` or `mysql.rds_start_replication_until_gtid` procedure stops replication, you can promote the read replica to be the new primary DB instance by using the instructions in [Promoting a read replica to be a standalone DB instance \(p. 286\)](#).

To use the `mysql.rds_start_replication_until_gtid` procedure, GTID-based replication must be enabled. To skip a specific GTID-based transaction that is known to cause disaster, you can use the [mysql.rds\\_skip\\_transaction\\_with\\_gtid \(p. 978\)](#) stored procedure. For more information about working with GTID-based replication, see [Using GTID-based replication for RDS for MySQL \(p. 919\)](#).

To specify the number of seconds for Amazon RDS to delay replication to a read replica, use the `mysql.rds_set_configuration` stored procedure and specify the number of seconds to delay

replication. The following example specifies that replication is delayed by at least one hour (3,600 seconds).

```
call mysql.rds_set_configuration('target delay', 3600);
```

The limit for the `target delay` parameter is one day (86400 seconds).

**Note**

The `target delay` parameter is only supported for RDS for MySQL.

The `target delay` parameter is not supported for RDS for MySQL version 8.0.

## mysql.rds\_show\_configuration

The number of hours that binary logs are retained.

### Syntax

```
CALL mysql.rds_show_configuration;
```

### Usage notes

To verify the number of hours that Amazon RDS retains binary logs, use the `mysql.rds_show_configuration` stored procedure.

The `mysql.rds_show_configuration` procedure is available in these versions of RDS for MySQL:

- MySQL 5.6
- MySQL 5.7
- MySQL 8.0

### Examples

The following example displays the retention period:

```
call mysql.rds_show_configuration;
 name value description
 binlog retention hours 24 binlog retention hours specifies the
duration in hours before binary logs are automatically deleted.
```

## mysql.rds\_kill

Ends a connection to the MySQL server.

### Syntax

```
CALL mysql.rds_kill(processID);
```

### Parameters

*processID*

The identity of the connection thread to be ended.

## Usage notes

Each connection to the MySQL server runs in a separate thread. To end a connection, use the `mysql.rds_kill` procedure and pass in the thread ID of that connection. To obtain the thread ID, use the MySQL [SHOW PROCESSLIST](#) command.

## Examples

The following example ends a connection with a thread ID of 4243:

```
call mysql.rds_kill(4243);
```

## mysql.rds\_kill\_query

Ends a query running against the MySQL server.

## Syntax

```
CALL mysql.rds_kill_query(queryID);
```

## Parameters

*queryID*

The identity of the query to be ended.

## Usage notes

To stop a query running against the MySQL server, use the `mysql_rds_kill_query` procedure and pass in the ID of that query. To obtain the query ID, query the MySQL [INFORMATION\\_SCHEMA PROCESSLIST](#) table. The connection to the MySQL server is retained.

## Examples

The following example stops a query with a thread ID of 230040:

```
call mysql.rds_kill_query(230040);
```

## mysql.rds\_rotate\_general\_log

Rotates the `mysql.general_log` table to a backup table. For more information, see [Accessing MySQL database log files \(p. 542\)](#).

## Syntax

```
CALL mysql.rds_rotate_general_log;
```

## Usage notes

You can rotate the `mysql.general_log` table to a backup table by calling the `mysql.rds_rotate_general_log` procedure. When log tables are rotated, the current log table is copied to a backup log table and the entries in the current log table are removed. If a backup log table already exists, then it is deleted before the current log table is copied to the backup. You can query the backup log table if needed. The backup log table for the `mysql.general_log` table is named `mysql.general_log_backup`.

## mysql.rds\_rotate\_slow\_log

Rotates the `mysql.slow_log` table to a backup table. For more information, see [Accessing MySQL database log files \(p. 542\)](#).

### Syntax

```
CALL mysql.rds_rotate_slow_log;
```

## Usage notes

You can rotate the `mysql.slow_log` table to a backup table by calling the `mysql.rds_rotate_slow_log` procedure. When log tables are rotated, the current log table is copied to a backup log table and the entries in the current log table are removed. If a backup log table already exists, then it is deleted before the current log table is copied to the backup.

You can query the backup log table if needed. The backup log table for the `mysql.slow_log` table is named `mysql.slow_log_backup`.

## mysql.rds\_enable\_gsh\_collector

Enables the Global Status History (GoSH) to take default snapshots at intervals specified by `rds_set_gsh_collector`. For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_enable_gsh_collector;
```

## mysql.rds\_set\_gsh\_collector

Specifies the interval, in minutes, between snapshots taken by the Global Status History (GoSH). Default value is For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_set_gsh_collector(intervalPeriod);
```

## Parameters

*intervalPeriod*

The interval, in minutes, between snapshots. Default value is

## mysql.rds\_disable\_gsh\_collector

Disables snapshots taken by the Global Status History (GoSH). For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_disable_gsh_collector;
```

## mysql.rds\_collect\_global\_status\_history

Takes a snapshot on demand for the Global Status History (GoSH). For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_collect_global_status_history;
```

## mysql.rds\_enable\_gsh\_rotation

Enables rotation of the contents of the `mysql.global_status_history` table to `mysql.global_status_history_old` at intervals specified by `rds_set_gsh_rotation`. For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_enable_gsh_rotation;
```

## mysql.rds\_set\_gsh\_rotation

Specifies the interval, in days, between rotations of the `mysql.global_status_history` table. Default value is 7. For more information, see [Managing the global status history \(p. 946\)](#).

### Syntax

```
CALL mysql.rds_set_gsh_rotation(intervalPeriod);
```

### Parameters

*intervalPeriod*

The interval, in days, between table rotations. Default value is 7.

## mysql.rds\_disable\_gsh\_rotation

Disables rotation of the `mysql.global_status_history` table. For more information, see [Managing the global status history \(p. 946\)](#).

## Syntax

```
CALL mysql.rds_disable_gsh_rotation;
```

## mysql.rds\_rotate\_global\_status\_history

Rotates the contents of the `mysql.global_status_history` table to `mysql.global_status_history_old` on demand. For more information, see [Managing the global status history \(p. 946\)](#).

## Syntax

```
CALL mysql.rds_rotate_global_status_history;
```

# Oracle on Amazon RDS

Amazon RDS supports DB instances that run the following versions and editions of Oracle Database:

- Oracle Database 19c (19.0.0.0)
- Oracle Database 18c (18.0.0.0)
- Oracle Database 12c Release 2 (12.2.0.1)
- Oracle Database 12c Release 1 (12.1.0.2)

## Note

Oracle Database 18c (18.0.0.0) is on a deprecation path. Oracle Corporation will no longer provide patches for Oracle Database 18c after the end-of-support date. For more information, see [Preparing for the automatic upgrade of Oracle Database 18c \(p. 1226\)](#). RDS for Oracle Database 11g is no longer supported.

You can create DB instances and DB snapshots, point-in-time restores, and automated or manual backups. You can use DB instances running Oracle inside a VPC. You can also add features to your Oracle DB instance by enabling various options. Amazon RDS supports Multi-AZ deployments for Oracle as a high-availability, failover solution.

To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances. It also restricts access to certain system procedures and tables that require advanced privileges. You can access databases on a DB instance using any standard SQL client application such as Oracle SQL\*Plus. However, you can't access the host directly by using Telnet or Secure Shell (SSH).

When you create a DB instance using your master account, the account gets DBA privileges, with some limitations. Use this account for administrative tasks such as creating additional database accounts. You can't use SYS, SYSTEM, or other Oracle-supplied administrative accounts.

Before creating a DB instance, complete the steps in the [Setting up for Amazon RDS \(p. 66\)](#) section of this guide.

## Oracle versions on Amazon RDS

Amazon RDS for Oracle supports the following major database releases.

### Topics

- [Oracle Database 19c with Amazon RDS \(p. 989\)](#)
- [Oracle Database 18c on Amazon RDS \(p. 990\)](#)
- [Oracle Database 12c with Amazon RDS \(p. 991\)](#)

## Oracle Database 19c with Amazon RDS

Amazon RDS supports Oracle Database 19c, which includes Oracle Enterprise Edition and Oracle Standard Edition Two.

Oracle Database 19c (19.0.0.0) includes many new features and updates from the previous version. In this section, you can find the features and changes important to using Oracle Database 19c (19.0.0.0) on Amazon RDS. For a complete list of the changes, see the [Oracle database 19c](#) documentation. For

a complete list of features supported by each Oracle Database 19c edition, see [Permitted features, options, and management packs by Oracle database offering](#) in the Oracle documentation.

## Amazon RDS parameter changes for Oracle Database 19c (19.0.0.0)

Oracle Database 19c (19.0.0.0) includes several new parameters and parameters with new ranges and new default values.

The following table shows the new Amazon RDS parameters for Oracle Database 19c (19.0.0.0).

Name	Values	Modified in	Description
<a href="#">lob_signature_enable</a>	TRUE, FALSE (default)	Y	Enables or disables the LOB locator signature feature.
<a href="#">max_datapump_parallel_per_job</a>	1 to 1024, or AUTO	Y	Specifies the maximum number of parallel processes allowed for each Oracle Data Pump job.

The `compatible` parameter has a new maximum value for Oracle Database 19c (19.0.0.0) on Amazon RDS. The following table shows the new default value.

Parameter name	Oracle Database 19c (19.0.0.0) maximum value	Oracle Database 18c (18.0.0.0) maximum value
<a href="#">compatible</a>	19.0.0	18.0.0

The following parameters were removed in Oracle Database 19c (19.0.0.0):

- `exafusion_enabled`
- `max_connections`
- `o7_dictionary_access`

## Oracle Database 18c on Amazon RDS

Oracle Corporation intends to deprecate support for Oracle Database 18c (18.0.0.0) on July 1, 2021. On this date, Amazon RDS plans to do the following:

- Deprecate support for Oracle Database 18c for both BYOL and LI
- Begin upgrading all Oracle Database 18c instances automatically

The following schedule includes upgrade recommendations. For more information, see [Preparing for the automatic upgrade of Oracle Database 18c \(p. 1226\)](#).

Action or recommendation	Oracle Database 18c
We recommend that you upgrade Oracle Database 18c DB instances manually to Oracle Database 19c and validate your applications.	Now–June 30, 2021

Action or recommendation	Oracle Database 18c
We recommend that you upgrade Oracle Database 18c snapshots manually to Oracle Database 19c.	May 1, 2021
You can no longer create new Oracle Database 18c instances with Amazon RDS. You can continue to restore 18c DB snapshots without being automatically upgraded until June 30, 2021.	May 1, 2021
Amazon RDS plans to start automatic upgrades of your Oracle Database 18c instances to Oracle Database 19c.	July 1, 2021
Amazon RDS plans to start automatic upgrades to Oracle Database 19c for any Oracle Database 18c DB instances restored from snapshots.	July 1, 2021

## Oracle Database 12c with Amazon RDS

Amazon RDS supports Oracle Database 12c, which includes Oracle Enterprise Edition and Oracle Standard Edition 2. Oracle Database 12c includes the following major versions:

- [Oracle Database 12c Release 2 \(12.2.0.1\) with Amazon RDS \(p. 991\)](#)
- [Oracle Database 12c Release 1 \(12.1.0.2\) with Amazon RDS \(p. 994\)](#)

## Oracle Database 12c Release 2 (12.2.0.1) with Amazon RDS

Oracle Database 12c Release 2 (12.2.0.1) includes many new features and updates from the previous version. In this section, you can find the features and changes important to using Oracle Database 12c Release 2 (12.2.0.1) on Amazon RDS. For a complete list of the changes, see the [Oracle Database 12c Release 2 \(12.2\) documentation](#). For a complete list of features supported by each Oracle Database 12c edition, see [Permitted features, options, and management packs by Oracle database offering](#) in the Oracle documentation.

### Amazon RDS parameter changes for Oracle Database 12c Release 2 (12.2.0.1)

Oracle Database 12c Release 2 (12.2.0.1) includes 20 new parameters in addition to several parameters with new ranges and new default values.

The following table shows the new Amazon RDS parameters for Oracle Database 12c Release 2 (12.2.0.1).

Name	Values	Modified	Description
allow_global_dblinks	TRUE, FALSE (default)	Y	Specifies whether LDAP lookup for database links is allowed for the database.
approx_for_aggregation	TRUE, FALSE (default)	Y	Replaces exact query processing for aggregation queries with approximate query processing.
approx_for_count_distinct	TRUE, FALSE (default)	Y	Automatically replaces COUNT (DISTINCT <i>expr</i> ) queries with APPROX_COUNT_DISTINCT queries.

Name	Values	Modifiable	Description
<a href="#">approx_for_percentile</a>	NONE (default), PERCENTILE_CONT, PERCENTILE_CONT DETERMINISTIC, PERCENTILE_DISC, PERCENTILE_DISC DETERMINISTIC, ALL, ALL DETERMINISTIC	Y	Converts exact percentile functions to their approximate percentile function counterparts.
<a href="#">cursor_invalidation</a>	DEFERRED, IMMEDIATE (default)	Y	Controls whether deferred cursor invalidation or immediate cursor invalidation is used for DDL statements by default.
<a href="#">data_guard_sync_latency</a>	0 (default) to the number of seconds specified by the NET_TIMEOUT attribute for the LOG_ARCHIVE_DEST_n parameter	Y	Controls how many seconds the Log Writer (LGWR) process waits beyond the response of the first in a series of Oracle Data Guard SYNC redo transport mode connections.
<a href="#">data_transfer_cache_size</a>	0 – 512M, rounded up to the next granule size	Y	Sets the size of the data transfer cache (in bytes) used to receive data blocks (typically from a primary database in an Oracle Data Guard environment) for consumption by an instance when an RMAN RECOVER ... NONLOGGED BLOCK command is running.
<a href="#">inmemory_adg_enabled</a>	TRUE (default), FALSE	Y	Indicates whether in-memory for Active Data Guard is enabled in addition to the in-memory cache size.
<a href="#">inmemory_expressions_usage</a>	STATIC_ONLY, DYNAMIC_ONLY, ENABLE (default), DISABLE	Y	Controls which In-Memory Expressions (IM expressions) are populated into the In-Memory Column Store (IM column store) and are available for queries.
<a href="#">inmemory_virtual_columns</a>	ENABLE, MANUAL (default), DISABLE	Y	Controls which In-Memory Expressions (IM expressions) are populated into the In-Memory Column Store (IM column store) and are available for queries.
<a href="#">instance_abort_delay_time</a>	0 (default) and higher	Y	Specifies how much time to delay an internally initiated instance shutdown (in seconds), such as when a fatal process dies or an unrecoverable instance error occurs.
<a href="#">instance_mode</a>	READ-WRITE (default), READ-ONLY, READ-MOSTLY	N	Indicates whether the instance is read-write, read-only, or read-mostly.

Name	Values	Modifiable	Description
<a href="#">long_module_action</a>	TRUE (default), FALSE	Y	Enables the use of longer lengths for modules and actions.
<a href="#">max_idle_time</a>	0 (default) to the maximum integer. The value of 0 indicates that there is no limit.	Y	Specifies the maximum number of minutes that a session can be idle. After that point, the session is automatically terminated.
<a href="#">optimizer_adaptive_plans</a>	TRUE (default), FALSE	Y	Controls adaptive plans. Adaptive plans are execution plans built with alternative choices that are decided at run time based on statistics collected as the query executes.
<a href="#">optimizer_adaptive_statistics</a>	TRUE, FALSE (default)	Y	Controls adaptive statistics. Some query shapes are too complex to rely on base table statistics alone, so the optimizer augments these statistics with adaptive statistics.
<a href="#">outbound_dblink_protocols</a>	ALL (default), NONE, TCP, TCPS, IPC	N	Specifies the network protocols allowed for communicating for outbound database links in the database.
<a href="#">resource_manage_goldengate</a>	TRUE, FALSE (default)	Y	Determines whether Oracle GoldenGate apply processes in the database are resource managed.
<a href="#">standby_db_preserve_states</a>	NONE (default), SESSION, ALL	N	Controls whether user sessions and other internal states of the instance are retained when a readable physical standby database is converted to a primary database.
<a href="#">uniform_log_timestamp_format</a>	TRUE (default), FALSE	Y	Specifies that a uniform timestamp format be used in Oracle Database trace (.trc) files and log files (such as the alert log).

The `compatible` parameter has a new default value for Oracle Database 12c Release 2 (12.2.0.1) on Amazon RDS. The following table shows the new default value.

Parameter name	Oracle Database 12c Release 2 (12.2.0.1) default value	Oracle Database 12c Release 1 (12.1.0.2) default value
<a href="#">compatible</a>	12.2.0	12.0.0

The `optimizer_features_enable` parameter has a new value range for Oracle Database 12c Release 2 (12.2.0.1) on Amazon RDS. For the old and new value ranges, see the following table.

Parameter name	Oracle Database 12c Release 2 (12.2.0.1) range	Oracle Database 12c Release 1 (12.1.0.2) range
<a href="#">optimizer_features</a> e8.0.0 to 12.2.0.1		8.0.0 to 12.1.0.2

The following parameters were removed in Oracle Database 12c Release 2 (12.2.0.1):

- `global_context_pool_size`
- `max_enabled_roles`
- `optimizer_adaptive_features`
- `parallel_automatic_tuning`
- `parallel_degree_level`
- `use_indirect_data_buffers`

The following parameter is not supported in Oracle Database 12c Release 2 (12.2.0.1) and later:

- `sec_case_sensitive_logon`

## Amazon RDS security changes for Oracle Database 12c Release 2 (12.2.0.1)

In Oracle Database 12c Release 2 (12.2.0.1), direct grant of the privilege `ADMINISTER DATABASE TRIGGER` is required for the owners of database-level triggers. During a major version upgrade to Oracle Database 12c Release 2 (12.2.0.1), Amazon RDS grants this privilege to any user that owns a trigger so that the trigger owner has the required privileges. For more information, see the My Oracle Support document [2275535.1](#).

## Oracle Database 12c Release 1 (12.1.0.2) with Amazon RDS

Oracle Database 12c Release 1 (12.1.0.2) brings over 500 new features and updates from the previous version. In this section, you can find the features and changes important to using Oracle Database 12c Release 1 (12.1.0.2) on Amazon RDS. For a complete list of the changes, see the [Oracle Database 12c Release 1 \(12.1\) documentation](#). For a complete list of features supported by each Oracle Database 12c edition, see [Permitted features, options, and management packs by Oracle database edition](#) in the Oracle documentation.

Oracle Database 12c Release 1 (12.1.0.2) includes 16 new parameters that impact your Amazon RDS DB instance, and also 18 new system privileges, several no longer supported packages, and several new option group settings. For more information on these changes, see the following sections.

## Amazon RDS parameter changes for Oracle Database 12c Release 1 (12.1.0.2)

Oracle Database 12c Release 1 (12.1.0.2) includes 16 new parameters in addition to several parameters with new ranges and new default values.

The following table shows the new Amazon RDS parameters for Oracle Database 12c Release 1 (12.1.0.2).

Name	Values	Modifi	Description
<a href="#">connection_brokers</a>	<code>CONNECTION_BROKERSN = broker_description[...]</code>		Specifies connection broker types, the number of connection brokers of each type, and the maximum number of connections per broker.

Name	Values	Modifiable	Description
<a href="#">db_index_compression_inheritance</a>	TABLESPACE, TABL, ALL, NONE	Y	Displays the options that are set for table or tablespace level compression inheritance.
<a href="#">db_big_table_cache_percent_target</a>	0-90	Y	Specifies the cache section target size for automatic big table caching, as a percentage of the buffer cache.
<a href="#">heat_map</a>	ON, OFF	Y	Enables the database to track read and write access of all segments and modification of database blocks that are due to data manipulation language (DML) and data definition language (DDL) statements.
<a href="#">inmemory_clause_default</a>	INMEMORY, NO INMEMORY	Y	INMEMORY_CLAUSE_DEFAULT enables you to specify a default In-Memory Column Store (IM column store) clause for new tables and materialized views.
<a href="#">inmemory_clause_default_memory_compression</a>	NO MEMCOMPRESS, MEMCOMPRESS FOR DML, MEMCOMPRESS FOR QUERY, MEMCOMPRESS FOR QUERY LOW, MEMCOMPRESS FOR QUERY HIGH, MEMCOMPRESS FOR CAPACITY, MEMCOMPRESS FOR CAPACITY LOW, MEMCOMPRESS FOR CAPACITY HIGH	Y	See INMEMORY_CLAUSE_DEFAULT.
<a href="#">inmemory_clause_default_priority</a>	PRIORITY LOW, PRIORITY MEDIUM, PRIORITY HIGH, PRIORITY CRITICAL, PRIORITY NONE	Y	See INMEMORY_CLAUSE_DEFAULT.
<a href="#">inmemory_force</a>	DEFAULT, OFF	Y	INMEMORY_FORCE allows you to specify whether tables and materialized view that are specified as INMEMORY are populated into the In-Memory Column Store (IM column store) or not.
<a href="#">inmemory_max_populate_servers</a>	Null	N	INMEMORY_MAX_POPULATE_SERVERS specifies the maximum number of background populate servers to use for In-Memory Column Store (IM column store) population, so that these servers don't overload the rest of the system.

Name	Values	Modifiable	Description
inmemory_query	ENABLE (default), DISABLE	Y	INMEMORY_QUERY is used to enable or disable in-memory queries for the entire database at the session or system level.
inmemory_size	0, 104857600-274877906944	Y	INMEMORY_SIZE sets the size of the In-Memory Column Store (IM column store) on a database instance.
inmemory_trickle_repopulate_servers_percent	0 to 50 percent	Y	INMEMORY_TRICKLE_REPOPULATE_SERVERS_PERCENT limits the maximum number of background populate servers used for In-Memory Column Store (IM column store) repopulation. This limit is applied because trickle repopulation is designed to use only a small percentage of the populate servers.
max_string_size	STANDARD (default), EXTENDED	N	Controls the maximum size of VARCHAR2, NVARCHAR2, and RAW.  For more information, see <a href="#">Enabling extended data types (p. 1116)</a> .
optimizer_adaptive_features	TRUE (default), FALSE	Y	Enables or disables all of the adaptive optimizer features.
optimizer_adaptive_reporting_only	TRUE, FALSE (default)	Y	Controls reporting-only mode for adaptive optimizations.
pdb_file_name_convert	There is no default value.	N	Maps names of existing files to new file names.
pga_aggregate_limit	0-max of memory	Y	Specifies a limit on the aggregate PGA memory consumed by the instance.
processor_group_name	There is no default value.	N	Instructs the database instance to run itself within the specified operating system processor group.
spatial_vector_acceleration	TRUE, FALSE	N	Enables or disables the spatial vector acceleration, part of spatial option.
temp_undo_enabled	TRUE, FALSE (default)	Y	Determines whether transactions within a particular session can have a temporary undo log.
threaded_execution	TRUE, FALSE	N	Enables the multithreaded Oracle model, but prevents OS authentication.
unified_audit_sga_queue_size	1 MB - 30 MB	Y	Specifies the size of the system global area (SGA) queue for unified auditing.
use_dedicated_broker	TRUE, FALSE	N	Determines how dedicated servers are spawned.

Several parameters have new value ranges for Oracle Database 12c Release 1 (12.1.0.2) on Amazon RDS. For the old and new value ranges, see the following table.

Parameter name	Oracle Database 12c Release 1 (12.1.0.2) range
<a href="#">audit_trail</a>	os   db [, extended]   xml [, extended]
<a href="#">compatible</a>	If you upgrade to Oracle Database 12c Release 2 (12.2.0.1), Oracle Database 18c, or Oracle Database 19c, COMPATIBLE must be 11.2.0 or higher. We recommend that you use the default settings for COMPATIBLE for your version of Oracle Database unless you have a reason to change it. If COMPATIBLE is not explicitly set, Amazon RDS automatically sets this parameter to 12.0.0.
<a href="#">db_securefile</a>	PERMITTED   PREFERRED   ALWAYS   IGNORE   FORCE
<a href="#">db_writer_processes</a>	1-100
<a href="#">optimizer_features_enable</a>	8.0.0 to 12.1.0.2
<a href="#">parallel_degree_policy</a>	MANUAL,LIMITED,AUTO,ADAPTIVE
<a href="#">parallel_min_server</a>	0 to parallel_max_servers

One parameter has a new default value for Oracle Database 12c on Amazon RDS. The following table shows the new default value.

Parameter name	Oracle Database 12c default value
<a href="#">job_queue_processes</a>	50

## Amazon RDS system privileges for Oracle Database 12c Release 1 (12.1.0.2)

Several new system privileges have been granted to the system account for Oracle Database 12c Release 1 (12.1.0.2). These new system privileges include the following:

- ALTER ANY CUBE BUILD PROCESS
- ALTER ANY MEASURE FOLDER
- ALTER ANY SQL TRANSLATION PROFILE
- CREATE ANY SQL TRANSLATION PROFILE
- CREATE SQL TRANSLATION PROFILE
- DROP ANY SQL TRANSLATION PROFILE
- EM EXPRESS CONNECT
- EXEMPT DDL REDACTION POLICY
- EXEMPT DML REDACTION POLICY
- EXEMPT REDACTION POLICY
- LOGMINING
- REDEFINE ANY TABLE
- SELECT ANY CUBE BUILD PROCESS
- SELECT ANY MEASURE FOLDER
- USE ANY SQL TRANSLATION PROFILE

## Amazon RDS options for Oracle Database 12c Release 1 (12.1.0.2)

Several Oracle options changed between Oracle Database 11g and Oracle Database 12c Release 1 (12.1.0.2), though most of the options remain the same between the two versions. The Oracle Database 12c Release 1 (12.1.0.2) changes include the following:

- Oracle Enterprise Manager Database Express 12c replaced Oracle Enterprise Manager 11g Database Control. For more information, see [Oracle Enterprise Manager Database Express \(p. 1162\)](#).
- The option XMLDB is installed by default in Oracle Database 12c Release 1 (12.1.0.2). You no longer need to install this option yourself.

## Amazon RDS PL/SQL packages for Oracle Database 12c Release 1 (12.1.0.2)

Oracle Database 12c Release 1 (12.1.0.2) includes a number of new built-in PL/SQL packages. The packages included with Amazon RDS for Oracle Database 12c Release 1 (12.1.0.2) include the following.

Package name	Description
CTX_ANL	The CTX_ANL package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.
DBMS_APP_CONT	The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.
DBMS_AUTO_REPORT	The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR).
DBMS_GOLDENGATE_AUTH	The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.
DBMS_HEAT_MAP	The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object, and tablespace.
DBMS_ILM	The DBMS_ILM package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.
DBMS_ILM_ADMIN	The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution.
DBMS_PART	The DBMS_PART package provides an interface for maintenance and management operations on partitioned objects.
DBMS_PRIVILEGE_CAPTURE	The DBMS_PRIVILEGE_CAPTURE package provides an interface to database privilege analysis.
DBMS_QOPATCH	The DBMS_QOPATCH package provides an interface to view the installed database patches.
DBMS_REDACT	The DBMS_REDACT package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.

Package name	Description
<a href="#">DBMS_SPD</a>	The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).
<a href="#">DBMS_SQL_TRANSLATOR</a>	The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.
<a href="#">DBMS_SQL_MONITOR</a>	The DBMS_SQL_MONITOR package provides information about real-time SQL Monitoring and real-time Database Operation Monitoring.
<a href="#">DBMS_SYNC_REFRESH</a>	The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.
<a href="#">DBMS_TSDP_MANAGE</a>	The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database. DBMS_TSDP_MANAGE is used with the <a href="#">DBMS_TSDP_PROTECT</a> package for transparent sensitive data protection (TSDP) policies. DBMS_TSDP_MANAGE is available with the Enterprise Edition only.
<a href="#">DBMS_TSDP_PROTECT</a>	The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the <a href="#">DBMS_TSDP_MANAGE</a> package. DBMS_TSDP_PROTECT is available with the Enterprise Edition only.
<a href="#">DBMS_XDB_CONFIG</a>	The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.
<a href="#">DBMS_XDB_CONSTANTS</a>	The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants. Oracle recommends using constants instead of dynamic strings to avoid typographical errors.
<a href="#">DBMS_XDB_REPOS</a>	The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.
<a href="#">DBMS_XMLSCHEMA_ANNOTATE</a>	The DBMS_XMLSCHEMA_ANNOTATE package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.
<a href="#">DBMS_XMLSTORAGE_MANAGE</a>	The DBMS_XMLSTORAGE_MANAGE package provides an interface to manage and modify XML storage after schema registration has been completed.
<a href="#">DBMS_XSTREAM_ADMIN</a>	The DBMS_XSTREAM_ADMIN package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.
<a href="#">DBMS_XSTREAM_AUTH</a>	The DBMS_XSTREAM_AUTH package provides subprograms for granting privileges to and revoking privileges from XStream administrators.
<a href="#">UTL_CALL_STACK</a>	The UTL_CALL_STACK package provides an interface to provide information about currently executing subprograms.

## Oracle Database 12c Release 1 (12.1.0.2) packages not supported

Several Oracle Database 11g PL/SQL packages are not supported in Oracle Database 12c Release 1 (12.1.0.2). These packages include the following:

- DBMS\_AUTO\_TASK\_IMMEDIATE
- DBMS\_CDC\_PUBLISH
- DBMS\_CDC\_SUBSCRIBE
- DBMS\_EXPFIL
- DBMS\_OBFUSCATION\_TOOLKIT
- DBMS\_RLMGR
- SDO\_NET\_MEM

## Oracle licensing options

Amazon RDS for Oracle has two licensing options: License Included (LI) and Bring Your Own License (BYOL). After you create an Oracle DB instance on Amazon RDS, you can change the licensing model by modifying the DB instance. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

### License Included

In the License Included model, you don't need to purchase Oracle licenses separately. AWS holds the license for the Oracle database software. In this model, if you have an AWS Support account with case support, contact AWS Support for both Amazon RDS and Oracle Database service requests. The License Included model is only supported on Amazon RDS for Oracle Database Standard Edition Two (SE2).

### Bring Your Own License (BYOL)

In the BYOL model, you can use your existing Oracle Database licenses to run Oracle deployments on Amazon RDS. You must have the appropriate Oracle Database license (with Software Update License and Support) for the DB instance class and Oracle Database edition you wish to run. You must also follow Oracle's policies for licensing Oracle Database software in the cloud computing environment. For more information on Oracle's licensing policy for Amazon EC2, see [Licensing Oracle software in the cloud computing environment](#).

In this model, you continue to use your active Oracle support account, and you contact Oracle directly for Oracle Database service requests. If you have an AWS Support account with case support, you can contact AWS Support for Amazon RDS issues. Amazon Web Services and Oracle have a multi-vendor support process for cases that require assistance from both organizations.

Amazon RDS supports the BYOL model only for Oracle Database Enterprise Edition (EE) and Oracle Database Standard Edition Two (SE2).

### Integrating with AWS License Manager

To make it easier to monitor Oracle license usage in the BYOL model, [AWS License Manager](#) integrates with Amazon RDS for Oracle. License Manager supports tracking of RDS for Oracle engine editions and licensing packs based on virtual cores (vCPUs). You can also use License Manager with AWS Organizations to manage all of your organizational accounts centrally.

The following table shows the product information filters for RDS for Oracle.

Filter	Name	Description
Engine Edition	oracle-ee	Oracle Database Enterprise Edition (EE)
	oracle-se2	Oracle Database Standard Edition Two (SE2)
License Pack	data_guard	See <a href="#">Working with Oracle replicas for Amazon RDS (p. 1131)</a> (Oracle Active Data Guard)
	olap	See <a href="#">Oracle OLAP (p. 1192)</a>
	ols	See <a href="#">Oracle Label Security (p. 1179)</a>
	diagnostic pack sqlt	See <a href="#">Oracle SQLT (p. 1205)</a>
	tuning pack sqlt	See <a href="#">Oracle SQLT (p. 1205)</a>

To track license usage of your Oracle DB instances, you can create a license configuration. In this case, RDS for Oracle resources that match the product information filter are automatically associated with the license configuration. Discovery of Oracle DB instances can take up to 24 hours.

## Console

### To create a license configuration to track the license usage of your Oracle DB instances

1. Go to <https://console.aws.amazon.com/license-manager/>.
2. Create a license configuration.

For instructions, see [Create a license configuration](#) in the *AWS License Manager User Guide*.

Add a rule for an **RDS Product Information Filter** in the **Product Information** panel.

For more information, see [ProductInformation](#) in the *AWS License Manager API Reference*.

## AWS CLI

To create a license configuration by using the AWS CLI, call the `create-license-configuration` command. Use the `--cli-input-json` or `--cli-input-yaml` parameters to pass the parameters to the command.

## Example

The following code creates a license configuration for Oracle Enterprise Edition.

```
aws license-manager create-license-configuration --cli-input-json file://rds-oracle-ee.json
```

The following is the sample `rds-oracle-ee.json` file used in the example.

```
{
 "Name": "rds-oracle-ee",
 "Description": "RDS Oracle Enterprise Edition",
 "LicenseCountingType": "vCPU",
 "LicenseCountHardLimit": false,
 "ProductInformationList": [
 {
 "Name": "rds-oracle-ee",
 "Description": "RDS Oracle Enterprise Edition",
 "LicenseCountingType": "vCPU",
 "LicenseCountHardLimit": false,
 "ProductInformation": [
 {
 "Name": "rds-oracle-ee",
 "Description": "RDS Oracle Enterprise Edition",
 "LicenseCountingType": "vCPU",
 "LicenseCountHardLimit": false
 }
]
 }
]
}
```

```
 "ResourceType": "RDS",
 "ProductInformationFilterList": [
 {
 "ProductInformationFilterName": "Engine Edition",
 "ProductInformationFilterValue": ["oracle-ee"],
 "ProductInformationFilterComparator": "EQUALS"
 }
]
}
```

For more information about product information, see [Automated discovery of resource inventory](#) in the *AWS License Manager User Guide*.

For more information about the `--cli-input` parameter, see [Generating AWS CLI skeleton and input parameters from a JSON or YAML input file](#) in the *AWS CLI User Guide*.

## Migrating between Oracle editions

If you have an unused BYOL Oracle license appropriate for the edition and class of DB instance that you plan to run, you can migrate from Standard Edition 2 (SE2) to Enterprise Edition (EE). You can't migrate from Enterprise Edition to other editions.

### To change the edition and retain your data

1. Create a snapshot of the DB instance.

For more information, see [Creating a DB snapshot \(p. 349\)](#).

2. Restore the snapshot to a new DB instance, and select the Oracle database edition you want to use.

For more information, see [Restoring from a DB snapshot \(p. 352\)](#).

3. (Optional) Delete the old DB instance, unless you want to keep it running and have the appropriate Oracle Database licenses for it.

For more information, see [Deleting a DB instance \(p. 326\)](#).

## Licensing Oracle Multi-AZ deployments

Amazon RDS supports Multi-AZ deployments for Oracle as a high-availability, failover solution. We recommend Multi-AZ for production workloads. For more information, see [High availability \(Multi-AZ\) for Amazon RDS \(p. 52\)](#).

If you use the Bring Your Own License model, you must have a license for both the primary DB instance and the standby DB instance in a Multi-AZ deployment.

## RDS for Oracle instance classes

The computation and memory capacity of a DB instance is determined by its DB instance class. The DB instance class you need depends on your processing power and memory requirements. For more information, see [DB instance classes \(p. 7\)](#).

The following are the DB instance classes supported for Oracle.

Oracle edition	Oracle Database 19c, Oracle Database 18c, and Oracle Database 12c Release 2 (12.2.0.1) support	Oracle Database 12c Release 1 (12.1.0.2) support
Enterprise Edition (EE)  Bring Your Own License (BYOL)	db.m5.large–db.m5.24xlarge db.m4.large–db.m4.16xlarge db.z1d.large–db.z1d.12xlarge db.x1e.xlarge–db.x1e.32xlarge db.x1.16xlarge–db.x1.32xlarge db.r5.large–db.r5.24xlarge db.r5b.large–db.r5b.24xlarge db.r4.large–db.r4.16xlarge db.t3.small–db.t3.2xlarge	db.m5.large–db.m5.24xlarge db.m4.large–db.m4.16xlarge db.z1d.large–db.z1d.12xlarge db.x1e.xlarge–db.x1e.32xlarge db.x1.16xlarge–db.x1.32xlarge db.r5.large–db.r5.24xlarge db.r5b.large–db.r5b.24xlarge db.r4.large–db.r4.16xlarge db.t3.micro–db.t3.2xlarge
Standard Edition 2 (SE2)  Bring Your Own License (BYOL)	db.m5.large–db.m5.4xlarge db.m4.large–db.m4.4xlarge db.z1d.large–db.z1d.3xlarge db.r5.large–db.r5.4xlarge db.r5b.large–db.r5b.4xlarge db.r4.large–db.r4.4xlarge db.t3.small–db.t3.2xlarge	db.m5.large–db.m5.4xlarge db.m4.large–db.m4.4xlarge db.z1d.large–db.z1d.3xlarge db.r5.large–db.r5.4xlarge db.r5b.large–db.r5b.4xlarge db.r4.large–db.r4.4xlarge db.t3.micro–db.t3.2xlarge
Standard Edition 2 (SE2)  License Included	db.m5.large–db.m5.4xlarge db.m4.large–db.m4.4xlarge db.r5.large–db.r5.4xlarge db.r4.large–db.r4.4xlarge db.t3.small–db.t3.2xlarge	db.m5.large–db.m5.4xlarge db.m4.large–db.m4.4xlarge db.r5.large–db.r5.4xlarge db.r4.large–db.r4.4xlarge db.t3.micro–db.t3.2xlarge

**Note**

We encourage all BYOL customers to consult their licensing agreement to assess the impact of Amazon RDS for Oracle deprecations. For more information on the compute capacity of DB instance classes supported by Amazon RDS for Oracle, see [DB instance classes \(p. 7\)](#) and [Configuring the processor for a DB instance class \(p. 20\)](#).

**Note**

If you have DB snapshots of DB instances that were using deprecated DB instance classes, you can choose a DB instance class that is not deprecated when you restore the DB snapshots. For more information, see [Restoring from a DB snapshot \(p. 352\)](#).

## Deprecated DB instance classes for Oracle

Following are the DB instance classes deprecated for Amazon RDS for Oracle:

- db.m1, db.m2, db.m3
- db.t1, db.t2
- db.r1, db.r2, db.r3

The preceding DB instance classes have been replaced by better performing DB instance classes that are generally available at a lower cost. Amazon RDS for Oracle automatically scales DB instances to DB instance classes that are not deprecated.

If you have DB instances that use deprecated DB instance classes, Amazon RDS will modify each one automatically to use a comparable DB instance class that is not deprecated. You can change the DB instance class for a DB instance yourself by modifying the DB instance. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

If you have snapshots of DB instances that were using deprecated instance classes, you can choose an that isn't deprecated when you restore the snapshots. For more information, see [Restoring from a DB snapshot \(p. 352\)](#).

## RDS for Oracle architecture

The *multitenant architecture* enables an Oracle database to function as a *multitenant container database (CDB)*. A CDB can include customer-created *pluggable databases (PDBs)*. A *non-CDB* is an Oracle database that uses the traditional architecture, which can't contain PDBs. For more information about the multitenant architecture, see [Oracle Multitenant Administrator's Guide](#).

For Oracle Database 19c, you must create a DB instance either as a CDB or a non-CDB. The architecture is a permanent characteristic and can't be changed later. For RDS for Oracle versions other than Oracle Database 19c, the architecture is always non-multitenant. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

Currently, RDS for Oracle supports a subset of multitenant architecture called the *single-tenant architecture*. In this case, your CDB contains only one PDB. The single-tenant architecture uses the same RDS APIs as the non-CDB architecture. Your experience with a non-CDB is mostly identical to your experience with a PDB. You can't access the CDB itself.

The following sections explain the principal differences between the non-multitenant and single-tenant architectures. For more information, see [Limitations of a single-tenant CDB \(p. 1012\)](#).

### Topics

- [Database creation and connections in a single-tenant architecture \(p. 1005\)](#)
- [User accounts and privileges in a single-tenant architecture \(p. 1005\)](#)
- [Parameters in a single-tenant architecture \(p. 1005\)](#)
- [Schemas in a single-tenant architecture \(p. 1005\)](#)

## Database creation and connections in a single-tenant architecture

When you create a CDB, specify the DB instance identifier just as for a non-CDB. The instance identifier forms the first part of your endpoint. The system identifier (SID) is the name of the CDB. The SID of every CDB is RDSCDB. You can't choose a different value.

In the single-tenant architecture, you always connect to the PDB rather than the CDB. Specify the endpoint for the PDB just as for a non-CDB. The only difference is that you specify `pdb_name` for the database name, where `pdb_name` is the name you chose for your PDB. The following example shows the format for the connection string in SQL\*Plus.

```
sqlplus 'dbuser@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=endpoint)(PORT=port))(CONNECT_DATA=(SID=pdb_name))'
```

## User accounts and privileges in a single-tenant architecture

In the Oracle multitenant architecture, all users accounts are either *common users* or *local users*. A CDB common user is a database user whose single identity and password are known in the CDB root and in every existing and future PDB. In contrast, a local user exists only in a single PDB.

The RDS master user is a local user account in the PDB. If you create new user accounts, these users will also be local users residing in the PDB. You can't use any user accounts to create new PDBs or modify the state of the existing PDB.

The `rdsadmin` user is a common user account. You can run Oracle for RDS packages that exist in this account, but you can't log in as `rdsadmin`. For more information, see [About Common Users and Local Users](#) in the Oracle documentation.

## Parameters in a single-tenant architecture

CDBs have their own parameter classes and different default parameter values. The CDB parameter classes are as follows:

- `oracle-ee-cdb-19`
- `oracle-se2-cdb-19`

You specify parameters at the CDB level rather than the PDB level. The PDB inherits parameter settings from the CDB. For more information about setting parameters, see [Working with DB parameter groups \(p. 138\)](#).

## Snapshots in a single-tenant architecture

Snapshots work the same in a single-tenant and non-multitenant architecture. The only difference is that when you restore a snapshot, you can only rename the PDB, not the CDB. The CDB is always named RDSCDB. For more information, see [Oracle Database considerations \(p. 353\)](#).

## RDS for Oracle features

Amazon RDS for Oracle supports most of the features and capabilities of Oracle Database. Some features might have limited support or restricted privileges. Some features are only available in

Enterprise Edition, and some require additional licenses. For more information about Oracle Database features for specific Oracle Database versions, see the *Oracle Database Licensing Information User Manual* for the version you're using.

**Note**

These lists are not exhaustive.

**Topics**

- [Supported features for RDS for Oracle \(p. 1006\)](#)
- [Unsupported features for RDS for Oracle \(p. 1007\)](#)

## Supported features for RDS for Oracle

Amazon RDS Oracle supports the following Oracle Database features:

- Advanced Compression
- Application Express (APEX)

For more information, see [Oracle Application Express \(APEX\) \(p. 1152\)](#).

- Automatic Memory Management
- Automatic Undo Management
- Automatic Workload Repository (AWR)

For more information, see [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#).

- Active Data Guard with Maximum Performance in the same AWS Region or across AWS Regions

For more information, see [Working with Oracle replicas for Amazon RDS \(p. 1131\)](#).

- Continuous Query Notification (version 12.1.0.2.v7 and later)

For more information, see [Using Continuous Query Notification \(CQN\) in the Oracle documentation](#).

- Data Redaction
- Database Change Notification

For more information, see [Database Change Notification](#) in the Oracle documentation.

**Note**

This feature changes to Continuous Query Notification in Oracle Database 12c Release 1 (12.1) and later.

- Database In-Memory (Oracle Database 12c and later)
- Distributed Queries and Transactions
- Edition-Based Redefinition

For more information, see [Setting the default edition for a DB instance \(p. 1069\)](#).

- EM Express (12c and later)

For more information, see [Oracle Enterprise Manager \(p. 1161\)](#).

- Fine-Grained Auditing
- Flashback Table, Flashback Query, Flashback Transaction Query
- Import/export (legacy and Data Pump) and SQL\*Loader

For more information, see [Importing data into Oracle on Amazon RDS \(p. 1118\)](#).

- Java Virtual Machine (JVM)

For more information, see [Oracle Java virtual machine \(p. 1176\)](#).

- Label Security (Oracle Database 12c and later)

For more information, see [Oracle Label Security \(p. 1179\)](#).

- Locator

For more information, see [Oracle Locator \(p. 1182\)](#).

- Materialized Views
- Multimedia

For more information, see [Oracle Multimedia \(p. 1185\)](#).

- Multitenant (single-tenant architecture only)

This feature is available only in Oracle Database 19c. For more information, see [RDS for Oracle architecture \(p. 1004\)](#) and [Limitations of a single-tenant CDB \(p. 1012\)](#).

- Network encryption

For more information, see [Oracle native network encryption \(p. 1188\)](#) and [Oracle Secure Sockets Layer \(p. 1194\)](#).

- Partitioning
- Spatial and Graph

For more information, see [Oracle Spatial \(p. 1202\)](#).

- Star Query Optimization
- Streams and Advanced Queuing
- Summary Management – Materialized View Query Rewrite
- Text (File and URL data store types are not supported)
- Total Recall
- Transparent Data Encryption (TDE)

For more information, see [Oracle Transparent Data Encryption \(p. 1216\)](#).

- Unified Auditing, Mixed Mode (Oracle Database 12c and later)

For more information, see [Mixed mode auditing](#) in the Oracle documentation.

- XML DB (without the XML DB Protocol Server)

For more information, see [Oracle XML DB \(p. 1220\)](#).

- Virtual Private Database

## Unsupported features for RDS for Oracle

Amazon RDS Oracle doesn't support the following Oracle Database features:

- Automatic Storage Management (ASM)
- Database Vault
- Flashback Database
- Messaging Gateway
- Oracle Enterprise Manager Cloud Control Management Repository
- Real Application Clusters (Oracle RAC)
- Real Application Testing

- Unified Auditing, Pure Mode
- Workspace Manager (WMSYS) schema

### Warning

In general, Amazon RDS doesn't prevent you from creating schemas for unsupported features. However, if you create schemas for Oracle features and components that require SYS privileges, you can damage the data dictionary and affect the availability of your instance. Use only supported features and schemas that are available in [Adding options to Oracle DB instances \(p. 1138\)](#).

## RDS for Oracle parameters

In Amazon RDS, you manage parameters using parameter groups. For more information, see [Working with DB parameter groups \(p. 229\)](#). To view the supported parameters for a specific Oracle Database edition and version, run the AWS CLI `describe-engine-default-parameters` command.

For example, to view the supported parameters for the Enterprise Edition of Oracle Database 12c Release 2 (12.2), run the following command.

```
aws rds describe-engine-default-parameters \
--db-parameter-group-family oracle-ee-12.2
```

## RDS for Oracle character sets

Amazon RDS for Oracle supports two types of character sets: the DB character set and national character set.

### DB character set

The Oracle database character set is used in the CHAR, VARCHAR2, and CLOB data types. The database also uses this character set for metadata such as table names, column names, and SQL statements. The Oracle database character set is typically referred to as the *DB character set*.

You set the character set when you create a DB instance. You can't change the DB character set after you create the database.

### Supported DB character sets

The following table lists the Oracle DB character sets that are supported in Amazon RDS. You can use a value from this table with the `--character-set-name` parameter of the AWS CLI `create-db-instance` command or with the `CharacterSetName` parameter of the Amazon RDS API `CreateDBInstance` operation.

#### Note

The character set for a CDB is always AL32UTF8. You can set a different character set for the PDB only.

Value	Description
AL32UTF8	Unicode 5.0 UTF-8 Universal character set (default)
AR8ISO8859P6	ISO 8859-6 Latin/Arabic

Value	Description
AR8MSWIN1256	Microsoft Windows Code Page 1256 8-bit Latin/Arabic
BLT8ISO8859P13	ISO 8859-13 Baltic
BLT8MSWIN1257	Microsoft Windows Code Page 1257 8-bit Baltic
CL8ISO8859P5	ISO 8859-5 Latin/Cyrillic
CL8MSWIN1251	Microsoft Windows Code Page 1251 8-bit Latin/Cyrillic
EE8ISO8859P2	ISO 8859-2 East European
EL8ISO8859P7	ISO 8859-7 Latin/Greek
EE8MSWIN1250	Microsoft Windows Code Page 1250 8-bit East European
EL8MSWIN1253	Microsoft Windows Code Page 1253 8-bit Latin/Greek
IW8ISO8859P8	ISO 8859-8 Latin/Hebrew
IW8MSWIN1255	Microsoft Windows Code Page 1255 8-bit Latin/Hebrew
JA16EUC	EUC 24-bit Japanese
JA16EUCTILDE	Same as JA16EUC except for mapping of wave dash and tilde to and from Unicode
JA16SJIS	Shift-JIS 16-bit Japanese
JA16SJISTILDE	Same as JA16SJIS except for mapping of wave dash and tilde to and from Unicode
KO16MSWIN949	Microsoft Windows Code Page 949 Korean
NE8ISO8859P10	ISO 8859-10 North European
NEE8ISO8859P4	ISO 8859-4 North and Northeast European
TH8TISASCII	Thai Industrial Standard 620-2533-ASCII 8-bit
TR8MSWIN1254	Microsoft Windows Code Page 1254 8-bit Turkish
US7ASCII	ASCII 7-bit American
UTF8	Unicode 3.0 UTF-8 Universal character set, CESU-8 compliant
VN8MSWIN1258	Microsoft Windows Code Page 1258 8-bit Vietnamese
WE8ISO8859P1	Western European 8-bit ISO 8859 Part 1
WE8ISO8859P15	ISO 8859-15 West European
WE8ISO8859P9	ISO 8859-9 West European and Turkish

Value	Description
WE8MSWIN1252	Microsoft Windows Code Page 1252 8-bit West European
ZHS16GBK	GBK 16-bit Simplified Chinese
ZHT16HKSCS	Microsoft Windows Code Page 950 with Hong Kong Supplementary Character Set HKSCS-2001. Character set conversion is based on Unicode 3.0.
ZHT16MSWIN950	Microsoft Windows Code Page 950 Traditional Chinese
ZHT32EUC	EUC 32-bit Traditional Chinese

## NLS\_LANG environment variable

A *locale* is a set of information addressing linguistic and cultural requirements that corresponds to a given language and country. Setting the NLS\_LANG environment variable in your client's environment is the simplest way to specify locale behavior for Oracle. This variable sets the language and territory used by the client application and the database server. It also indicates the client's character set, which corresponds to the character set for data entered or displayed by a client application. For more information on NLS\_LANG and character sets, see [What is a character set or code page?](#) in the Oracle documentation.

## NLS initialization parameters

You can also set the following National Language Support (NLS) initialization parameters at the instance level for an Oracle DB instance in Amazon RDS:

- NLS\_DATE\_FORMAT
- NLS\_LENGTH\_SEMANTICS
- NLS\_NCHAR\_CONV\_EXCP
- NLS\_TIME\_FORMAT
- NLS\_TIME\_TZ\_FORMAT
- NLS\_TIMESTAMP\_FORMAT
- NLS\_TIMESTAMP\_TZ\_FORMAT

For information about modifying instance parameters, see [Working with DB parameter groups \(p. 229\)](#).

You can set other NLS initialization parameters in your SQL client. For example, the following statement sets the NLS\_LANGUAGE initialization parameter to GERMAN in a SQL client that is connected to an Oracle DB instance:

```
ALTER SESSION SET NLS_LANGUAGE=GERMAN;
```

For information about connecting to an Oracle DB instance with a SQL client, see [Connecting to your Oracle DB instance \(p. 1013\)](#).

## National character set

The national character set is used in the `NCHAR`, `NVARCHAR2`, and `NCLOB` data types. The national character set is typically referred to as the *NCHAR character set*. Unlike the DB character set, the `NCHAR` character set doesn't affect database metadata.

The `NCHAR` character set supports the following character sets:

- `AL16UTF16` (default)
- `UTF8`

You can specify either value with the `--nchar-character-set-name` parameter of the [create-db-instance](#) command (AWS CLI version 2 only). If you use the Amazon RDS API, specify the `NcharCharacterSetName` parameter of [CreateDBInstance](#) operation. You can't change the national character set after you create the database.

For more information about Unicode in Oracle databases, see [Supporting multilingual databases with unicode](#) in the Oracle documentation.

## RDS for Oracle limitations

Following are important limitations of using Amazon RDS for Oracle.

**Note**

This list is not exhaustive.

**Topics**

- [Oracle file size limits in Amazon RDS \(p. 1011\)](#)
- [Public synonyms for Oracle-supplied schemas \(p. 1011\)](#)
- [Schemas for unsupported features \(p. 1012\)](#)
- [Limitations for Oracle DBA privileges \(p. 1012\)](#)
- [Limitations of a single-tenant CDB \(p. 1012\)](#)
- [Deprecation of TLS 1.0 and 1.1 Transport Layer Security \(p. 1012\)](#)

## Oracle file size limits in Amazon RDS

The maximum file size on Amazon RDS Oracle DB instances is 16 TiB (tebibytes). If you try to resize a data file in a bigfile tablespace to a value over the limit, you receive an error such as the following.

```
ORA-01237: cannot extend datafile 6
ORA-01110: data file 6: '/rdsdbdata/db/mydir/datafile/myfile.dbf'
ORA-27059: could not reduce file size
Linux-x86_64 Error: 27: File too large
Additional information: 2
```

## Public synonyms for Oracle-supplied schemas

Don't create or modify public synonyms for Oracle-supplied schemas, including `SYS`, `SYSTEM`, and `RDSADMIN`. Such actions might result in invalidation of core database components and affect the availability of your DB instance.

You can create public synonyms referencing objects in your own schemas.

## Schemas for unsupported features

In general, Amazon RDS doesn't prevent you from creating schemas for unsupported features. However, if you create schemas for Oracle features and components that require SYS privileges, you can damage the data dictionary and affect your instance availability. Use only supported features and schemas that are available in [Adding options to Oracle DB instances \(p. 1138\)](#).

## Limitations for Oracle DBA privileges

In the database, a *role* is a collection of privileges that you can grant to or revoke from a user. An Oracle database uses roles to provide security.

The predefined role DBA normally allows all administrative privileges on an Oracle database. When you create a DB instance, your master user account gets DBA privileges (with some limitations). To deliver a managed experience, an RDS for Oracle database doesn't provide the following privileges for the DBA role:

- ALTER DATABASE
- ALTER SYSTEM
- CREATE ANY DIRECTORY
- DROP ANY DIRECTORY
- GRANT ANY PRIVILEGE
- GRANT ANY ROLE

Use the master user account for administrative tasks such as creating additional user accounts in the database. You can't use SYS, SYSTEM, and other Oracle-supplied administrative accounts.

## Limitations of a single-tenant CDB

The following options aren't supported for the single-tenant architecture:

- Oracle Data Guard
- Oracle Enterprise Manager
- Oracle Enterprise Manager Agent
- Oracle Label Security

The following operations work in a single-tenant CDB, but no customer-visible mechanism can detect the current status of the operations:

- [Enabling and disabling block change tracking \(p. 1088\)](#)
- [Enabling auditing for the SYS.AUD\\$ table \(p. 1069\)](#)

**Note**

Auditing information isn't available from within the PDB.

## Deprecation of TLS 1.0 and 1.1 Transport Layer Security

Transport Layer Security protocol versions 1.0 and 1.1 (TLS 1.0 and TLS 1.1) are deprecated. In accordance with security best practices, Oracle has deprecated the use of TLS 1.0 and TLS 1.1. To meet your security requirements, RDS for Oracle strongly recommends that you use TLS 1.2 instead.

# Connecting to your Oracle DB instance

After Amazon RDS provisions your Oracle DB instance, you can use any standard SQL client application to connect to the DB instance. In this topic, you connect to a DB instance that is running the Oracle database engine by using Oracle SQL Developer or SQL\*Plus.

For an example that walks you through the process of creating and connecting to a sample DB instance, see [Creating an Oracle DB instance and connecting to a database on an Oracle DB instance \(p. 92\)](#).

## Topics

- [Finding the endpoint of your Oracle DB instance \(p. 1013\)](#)
- [Connecting to your DB instance using Oracle SQL developer \(p. 1015\)](#)
- [Connecting to your DB instance using SQL\\*Plus \(p. 1017\)](#)
- [Considerations for security groups \(p. 1018\)](#)
- [Considerations for process architecture \(p. 1018\)](#)
- [Troubleshooting connections to your Oracle DB instance \(p. 1018\)](#)
- [Modifying connection properties using sqlnet.ora parameters \(p. 1019\)](#)

## Finding the endpoint of your Oracle DB instance

Each Amazon RDS DB instance has an endpoint, and each endpoint has the DNS name and port number for the DB instance. To connect to your DB instance using a SQL client application, you need the DNS name and port number for your DB instance.

You can find the endpoint for a DB instance using the Amazon RDS console or the AWS CLI.

### Note

If you are using Kerberos authentication, see [Connecting to Oracle with Kerberos authentication \(p. 1037\)](#).

## Console

### To find the endpoint using the console

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the upper-right corner of the console, choose the AWS Region of your DB instance.
3. Find the DNS name and port number for your DB Instance.
  - a. Choose **Databases** to display a list of your DB instances.
  - b. Choose the Oracle DB instance name to display the instance details.
  - c. On the **Connectivity & security** tab, copy the endpoint. Also, note the port number. You need both the endpoint and the port number to connect to the DB instance.

# database-1

[Modify](#)

## Summary

DB identifier database-1	CPU <div style="width: 2.3%;"><div style="width: 2.3%;"></div></div> 2.30%	Status <span style="color: green;">Available</span>	Class db.m4.large
Role Instance	Current activity <div style="width: 0.01%;"><div style="width: 0.01%;"></div></div> 0.01 Sessions	Engine Oracle Standard Edition Two	Region & AZ us-east-1f

[Connectivity & security](#) [Monitoring](#) [Logs & events](#) [Configuration](#) [Maintenance & backups](#)

## Connectivity & security

Endpoint & port	Networking	Security
Endpoint database-1.abcdefghijkl.us-east-1.rds.amazonaws.com	Availability zone us-east-1f	VPC security groups default (sg-0a5cba2b) (active)
Port 1521	VPC vpc-1234567f	Public accessibility No
	Subnet group	

## AWS CLI

To find the endpoint of an Oracle DB instance by using the AWS CLI, call the [describe-db-instances](#) command.

### Example To find the endpoint using the AWS CLI

```
aws rds describe-db-instances
```

Search for `Endpoint` in the output to find the DNS name and port number for your DB instance. The `Address` line in the output contains the DNS name. The following is an example of the JSON endpoint output.

```
{"Endpoint": {
 "HostedZoneId": "Z1PVIF0B656C1W",
 "Port": 3306,
 "Address": "myinstance.123456789012.us-west-2.rds.amazonaws.com"
},
```

**Note**

The output might contain information for multiple DB instances.

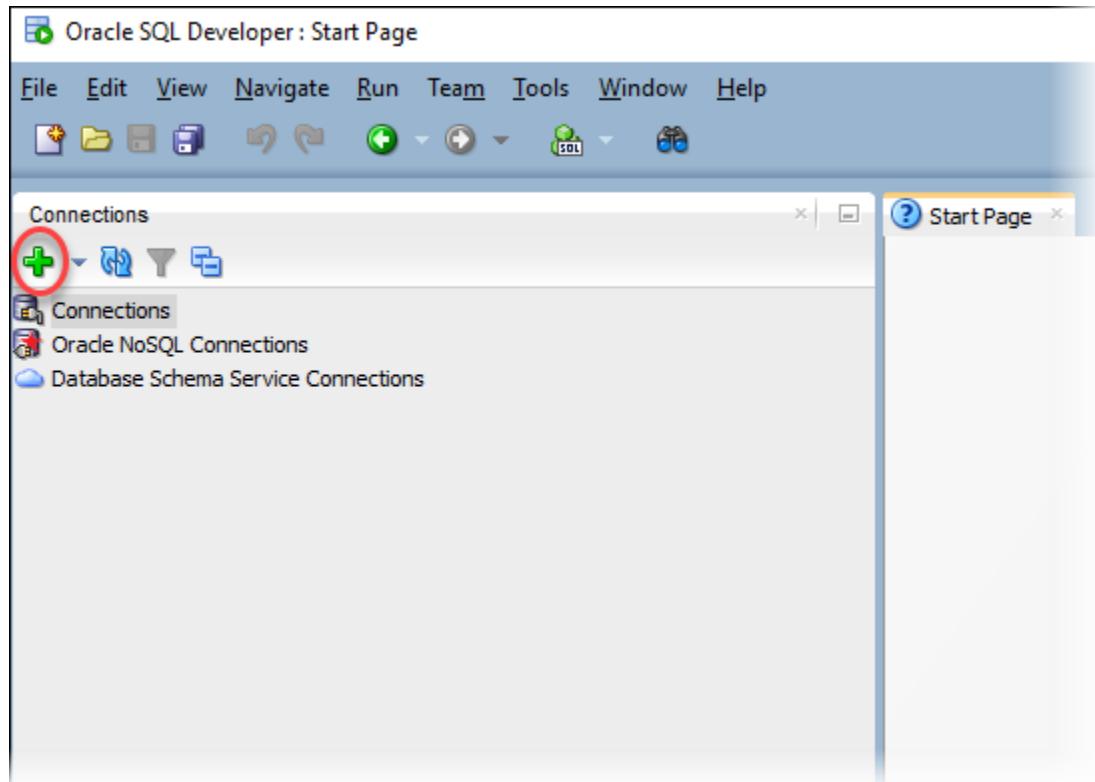

## Connecting to your DB instance using Oracle SQL developer

In this procedure, you connect to your DB instance by using Oracle SQL Developer. To download a standalone version of this utility, see the [Oracle SQL developer downloads page](#).

To connect to your DB instance, you need its DNS name and port number. For information about finding the DNS name and port number for a DB instance, see [Finding the endpoint of your Oracle DB instance \(p. 1013\)](#).

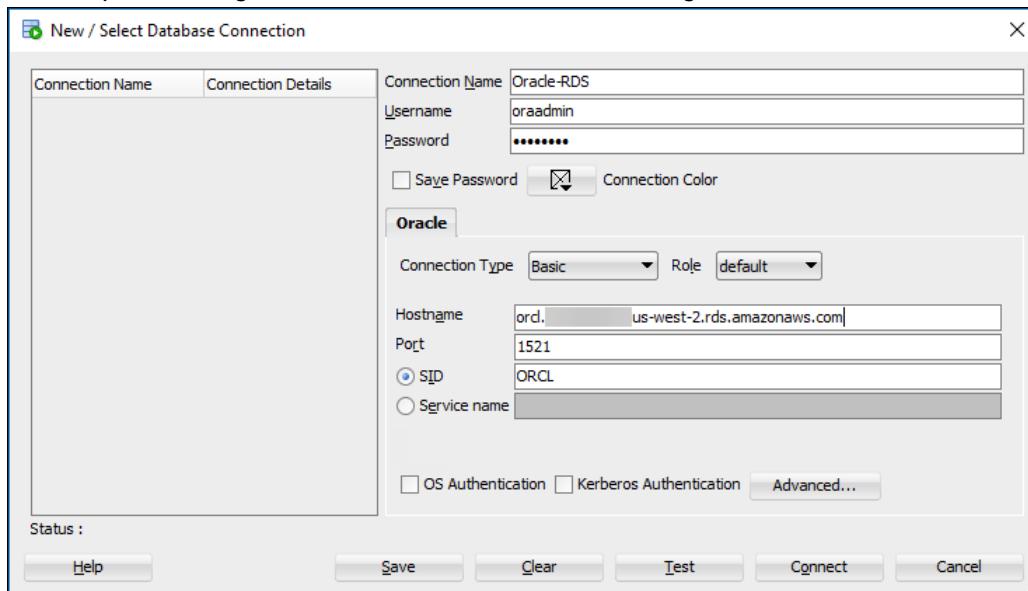

### To connect to a DB instance using SQL developer

1. Start Oracle SQL Developer.
2. On the **Connections** tab, choose the **add (+)** icon.

3. In the **New/Select Database Connection** dialog box, provide the information for your DB instance:
  - For **Connection Name**, enter a name that describes the connection, such as Oracle-RDS.
  - For **Username**, enter the name of the database administrator for the DB instance.
  - For **Password**, enter the password for the database administrator.
  - For **Hostname**, enter the DNS name of the DB instance.
  - For **Port**, enter the port number.
  - For **SID**, enter the Oracle database SID.

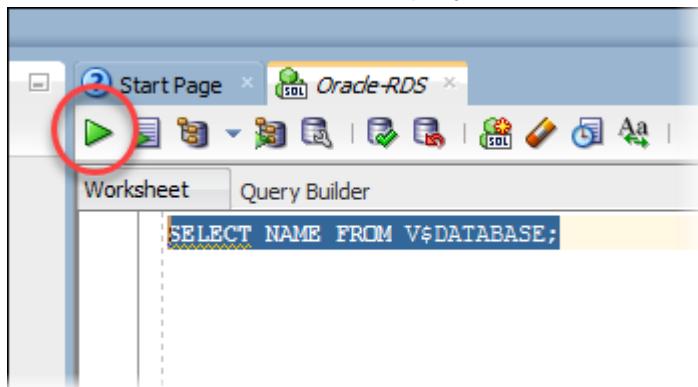

The completed dialog box should look similar to the following.

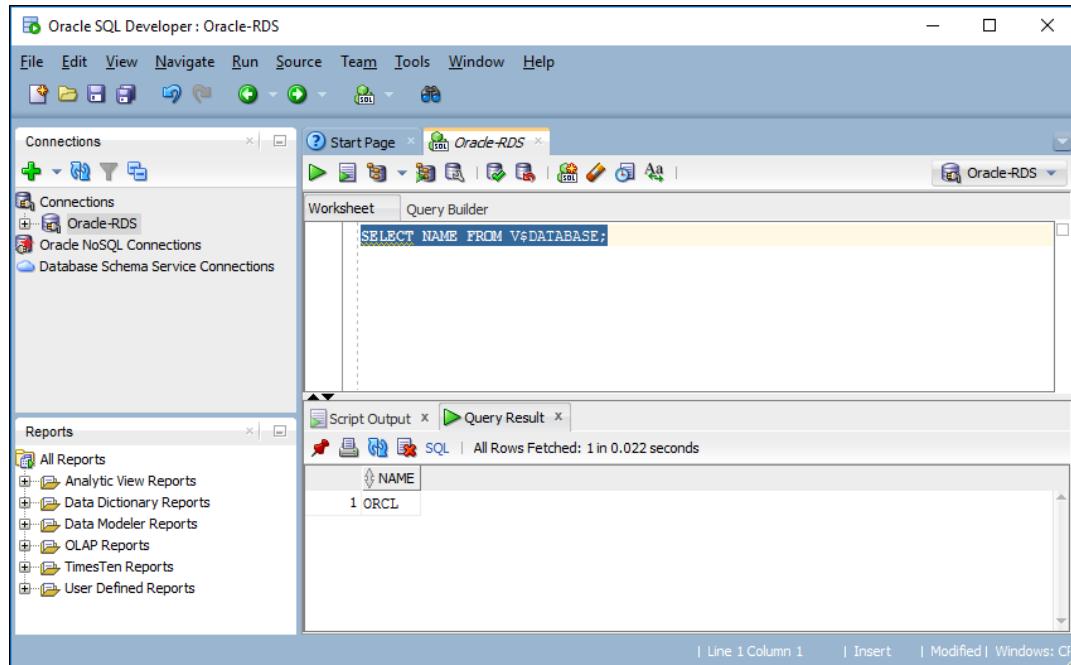

4. Choose **Connect**.
5. You can now start creating your own databases and running queries against your DB instance and databases as usual. To run a test query against your DB instance, do the following:
  - a. In the **Worksheet** tab for your connection, enter the following SQL query.

```
SELECT NAME FROM V$DATABASE;
```

- b. Choose the **execute** icon to run the query.

SQL Developer returns the database name.

## Connecting to your DB instance using SQL\*Plus

You can use a utility like SQL\*Plus to connect to an Amazon RDS DB instance running Oracle. To download Oracle Instant Client, which includes a standalone version of SQL\*Plus, see [Oracle Instant Client Downloads](#).

To connect to your DB instance, you need its DNS name and port number. For information about finding the DNS name and port number for a DB instance, see [Finding the endpoint of your Oracle DB instance \(p. 1013\)](#).

### Example To connect to an Oracle DB instance using SQL\*Plus

In the following examples, substitute the user name of your DB instance administrator. Also, substitute the DNS name for your DB instance, and then include the port number and the Oracle SID. The SID value is the name of the DB instance's database that you specified when you created the DB instance, and not the name of the DB instance.

For Linux, macOS, or Unix:

```
sqlplus 'user_name@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=dns_name)(PORT=port))(CONNECT_DATA=(SID=database_name)))'
```

For Windows:

```
sqlplus user_name@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=dns_name)(PORT=port))(CONNECT_DATA=(SID=database_name)))
```

You should see output similar to the following.

```
SQL*Plus: Release 12.1.0.2.0 Production on Mon Aug 21 09:42:20 2017
```

After you enter the password for the user, the SQL prompt appears.

```
SQL>
```

**Note**

The shorter format connection string (Easy connect or EZCONNECT), such as `sqlplus USER/PASSWORD@LONGER-THAN-63-CHARS-RDS-ENDPOINT-HERE:1521/DATABASE_IDENTIFIER`, might encounter a maximum character limit and should not be used to connect.

## Considerations for security groups

For you to connect to your DB instance, it must be associated with a security group that contains the necessary IP addresses and network configuration. Your DB instance might use the default security group. If you assigned a default, nonconfigured security group when you created the DB instance, the firewall prevents connections.

To create a new security group, security group that you create depends on the Amazon EC2 platform for your DB instance. To determine your platform, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#). In general, if your DB instance is on the *EC2-Classic* platform, you create a DB security group; if your DB instance is on the VPC platform, you create a VPC security group. For information about creating a new security group, see [Controlling access with security groups \(p. 1737\)](#).

After you create the new security group, you modify your DB instance to associate it with the security group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

You can enhance security by using SSL to encrypt connections to your DB instance. For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

## Considerations for process architecture

Server processes handle user connections to an Oracle DB instance. By default, the Oracle DB instance uses dedicated server processes. With dedicated server processes, each server process services only one user process. You can optionally configure shared server processes. With shared server processes, each server process can service multiple user processes.

You might consider using shared server processes when a high number of user sessions are using too much memory on the server. You might also consider shared server processes when sessions connect and disconnect very often, resulting in performance issues. There are also disadvantages to using shared server processes. For example, they can strain CPU resources, and they are more complicated to configure and administer.

For more information about dedicated and shared server processes, see [About dedicated and shared server processes](#) in the Oracle documentation. For more information about configuring shared server processes on an RDS for Oracle DB instance, see [How do I configure Amazon RDS for Oracle database to work with shared servers?](#) in the Knowledge Center.

## Troubleshooting connections to your Oracle DB instance

The following are issues you might encounter when you try to connect to your Oracle DB instance.

Issue	Troubleshooting suggestions
Unable to connect to your DB instance.	For a newly created DB instance, the DB instance has a status of <b>creating</b> until it is ready to use. When the state changes to <b>available</b> , you can connect to the DB instance. Depending on the DB instance class and the amount of storage, it can take up to 20 minutes before the new DB instance is available.
Unable to connect to your DB instance.	If you can't send or receive communications over the port that you specified when you created the DB instance, you can't connect to the DB instance. Check with your network administrator to verify that the port you specified for your DB instance allows inbound and outbound communication.
Unable to connect to your DB instance.	<p>The access rules enforced by your local firewall and the IP addresses you authorized to access your DB instance in the security group for the DB instance might not match. The problem is most likely the inbound or outbound rules on your firewall.</p> <p>You can add or edit an inbound rule in the security group. For <b>Source</b>, choose <b>My IP</b>. This allows access to the DB instance from the IP address detected in your browser. For more information, see <a href="#">Amazon Virtual Private Cloud VPCs and Amazon RDS (p. 1756)</a>.</p> <p>For more information about security groups, see <a href="#">Controlling access with security groups (p. 1737)</a>.</p> <p>To walk through the process of setting up rules for your security group, see <a href="#">Tutorial: Create an Amazon VPC for use with a DB instance (p. 1775)</a>.</p>
<b>Connect failed because target host or object does not exist – Oracle, Error: ORA-12545</b>	<p>Make sure that you specified the server name and port number correctly. For <b>Server name</b>, enter the DNS name from the console.</p> <p>For information about finding the DNS name and port number for a DB instance, see <a href="#">Finding the endpoint of your Oracle DB instance (p. 1013)</a>.</p>
<b>Invalid username/password; logon denied – Oracle, Error: ORA-01017</b>	You were able to reach the DB instance, but the connection was refused. This is usually caused by providing an incorrect user name or password. Verify the user name and password, and then retry.

For more information on connection issues, see [Can't connect to Amazon RDS DB instance \(p. 1784\)](#).

## Modifying connection properties using sqlnet.ora parameters

The sqlnet.ora file includes parameters that configure Oracle Net features on Oracle database servers and clients. Using the parameters in the sqlnet.ora file, you can modify properties for connections in and out of the database.

For more information about why you might set sqlnet.ora parameters, see [Configuring profile parameters in the Oracle documentation](#).

## Setting sqlnet.ora parameters

Amazon RDS for Oracle parameter groups include a subset of sqlnet.ora parameters. You set them in the same way that you set other Oracle parameters. The `sqlnetora.` prefix identifies which parameters are sqlnet.ora parameters. For example, in an Oracle parameter group in Amazon RDS, the `default_sdu_size` sqlnet.ora parameter is `sqlnetora.default_sdu_size`.

For information about managing parameter groups and setting parameter values, see [Working with DB parameter groups \(p. 229\)](#).

## Supported sqlnet.ora parameters

Amazon RDS supports the following sqlnet.ora parameters. Changes to dynamic sqlnet.ora parameters take effect immediately.

Parameter	Valid values	Static/ Dynamic	Description
<code>sqlnetora.default_sdu_size</code>	Oracle 12c – 512 to 2097152	Dynamic	<p>The session data unit (SDU) size, in bytes.</p> <p>The SDU is the amount of data that is put in a buffer and sent across the network at one time.</p>
<code>sqlnetora.diag_adr_enabled</code>	ON, OFF	Dynamic	<p>A value that enables or disables Automatic Diagnostic Repository (ADR) tracing.</p> <p>ON specifies that ADR file tracing is used.</p> <p>OFF specifies that non-ADR file tracing is used.</p>
<code>sqlnetora.recv_buf_size</code>	8192 to 268435456	Dynamic	The buffer space limit for receive operations of sessions, supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.
<code>sqlnetora.send_buf_size</code>	8192 to 268435456	Dynamic	The buffer space limit for send operations of sessions, supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.
<code>sqlnetora.sqlnet.allowed_logon_version_client</code>	8, 9, 10, 11, 12	Dynamic	Minimum authentication protocol version allowed for clients, and servers acting as clients, to establish a connection to Oracle DB instances.
<code>sqlnetora.sqlnet.allowed_logon_version_server</code>	8, 9, 10, 11, 12, 12a	Dynamic	Minimum authentication protocol version allowed to establish a connection to Oracle DB instances.
<code>sqlnetora.sqlnet.expire_time</code>	0 to 1440	Dynamic	Time interval, in minutes, to send a check to verify that client-server connections are active.

Parameter	Valid values	Static/ Dynamic	Description
sqlnetora.sqlnet.inbound_connect_timeout	0 or 10 to 7200	Dynamic	Time, in seconds, for a client to connect with the database server and provide the necessary authentication information.
sqlnetora.sqlnet.outbound_connect_timeout	0 or 10 to 7200	Dynamic	Time, in seconds, for a client to establish an Oracle Net connection to the DB instance.
sqlnetora.sqlnet.recv_timeout	0 or 10 to 7200	Dynamic	Time, in seconds, for a database server to wait for client data after establishing a connection.
sqlnetora.sqlnet.send_timeout	0 or 10 to 7200	Dynamic	Time, in seconds, for a database server to complete a send operation to clients after establishing a connection.
sqlnetora.tcp.connect_timeout	0 or 10 to 7200	Dynamic	Time, in seconds, for a client to establish a TCP connection to the database server.
sqlnetora.trace_level_server	0, 4, 10, 16, OFF, USER, ADMIN, SUPPORT	Dynamic	For non-ADR tracing, turns server tracing on at a specified level or turns it off.

The default value for each supported sqlnet.ora parameter is the Oracle default for the release. For information about default values for Oracle Database 12c, see [Parameters for the sqlnet.ora file](#) in the Oracle Database 12c documentation.

## Viewing sqlnet.ora parameters

You can view sqlnet.ora parameters and their settings using the AWS Management Console, the AWS CLI, or a SQL client.

### Viewing sqlnet.ora parameters using the console

For information about viewing parameters in a parameter group, see [Working with DB parameter groups \(p. 229\)](#).

In Oracle parameter groups, the `sqlnetora.` prefix identifies which parameters are sqlnet.ora parameters.

### Viewing sqlnet.ora parameters using the AWS CLI

To view the sqlnet.ora parameters that were configured in an Oracle parameter group, use the AWS CLI `describe-db-parameters` command.

To view the all of the sqlnet.ora parameters for an Oracle DB instance, call the AWS CLI `download-db-log-file-portion` command. Specify the DB instance identifier, the log file name, and the type of output.

### Example

The following code lists all of the sqlnet.ora parameters for `mydbinstance`.

For Linux, macOS, or Unix:

```
aws rds download-db-log-file-portion \
--db-instance-identifier mydbinstance \
--log-file-name trace/sqlnet-parameters \
--output text
```

For Windows:

```
aws rds download-db-log-file-portion ^
--db-instance-identifier mydbinstance ^
--log-file-name trace/sqlnet-parameters ^
--output text
```

## Viewing sqlnet.ora parameters using a SQL client

After you connect to the Oracle DB instance in a SQL client, the following query lists the sqlnet.ora parameters.

```
SELECT * FROM TABLE
 (rdsadmin.rds_file_util.read_text_file(
 p_directory => 'BDUMP',
 p_filename => 'sqlnet-parameters'));
```

For information about connecting to an Oracle DB instance in a SQL client, see [Connecting to your Oracle DB instance \(p. 1013\)](#).

# Securing Oracle DB instance connections

Amazon RDS Oracle supports SSL/TLS encrypted connections and also the Oracle Native Network Encryption (NNE) option to encrypt connections between your application and your Oracle DB instance. For more information about the Oracle Native Network Encryption option, see [Oracle native network encryption \(p. 1188\)](#).

## Encrypting client connections with SSL

Secure Sockets Layer (SSL) is an industry-standard protocol for securing network connections between client and server. After SSL version 3.0, the name was changed to Transport Layer Security (TLS), but we still often refer to the protocol as SSL. Amazon RDS supports SSL encryption for Oracle DB instances. Using SSL, you can encrypt a connection between your application client and your Oracle DB instance. SSL support is available in all AWS regions for Oracle.

To enable SSL encryption for an Oracle DB instance, add the Oracle SSL option to the option group associated with the DB instance. Amazon RDS uses a second port, as required by Oracle, for SSL connections. Doing this allows both clear text and SSL-encrypted communication to occur at the same time between a DB instance and an Oracle client. For example, you can use the port with clear text communication to communicate with other resources inside a VPC while using the port with SSL-encrypted communication to communicate with resources outside the VPC.

For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

### Note

You can't use both SSL and Oracle native network encryption (NNE) on the same DB instance. Before you can use SSL encryption, you must disable any other connection encryption.

# Updating applications to use new SSL/TLS certificates

As of September 19, 2019, Amazon RDS has published new Certificate Authority (CA) certificates for connecting to your RDS DB instances using Secure Socket Layer or Transport Layer Security (SSL/TLS). Following, you can find information about updating your applications to use the new certificates.

This topic can help you to determine whether any client applications use SSL/TLS to connect to your DB instances.

## Important

When you change the certificate for an Amazon RDS for Oracle DB instance, only the database listener is restarted. The DB instance isn't restarted. Existing database connections are unaffected, but new connections will encounter errors for a brief period while the listener is restarted.

## Note

For client applications that use SSL/TLS to connect to your DB instances, you must update your client application trust stores to include the new CA certificates.

After you update your CA certificates in the client application trust stores, you can rotate the certificates on your DB instances. We strongly recommend testing these procedures in a development or staging environment before implementing them in your production environments.

For more information about certificate rotation, see [Rotating your SSL/TLS certificate \(p. 1673\)](#). For more information about downloading certificates, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#). For information about using SSL/TLS with Oracle DB instances, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

## Topics

- [Finding out whether applications connect using SSL \(p. 1023\)](#)
- [Updating your application trust store \(p. 1024\)](#)
- [Example Java code for establishing SSL connections \(p. 1025\)](#)

## Finding out whether applications connect using SSL

If your Oracle DB instance uses an option group with the `SSL` option added, you might be using SSL. Check this by following the instructions in [Listing the options and option settings for an option group \(p. 221\)](#). For information about the `SSL` option, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

Check the listener log to determine whether there are SSL connections. The following is sample output in a listener log.

```
date time * (CONNECT_DATA=(CID=(PROGRAM=program)
(HOST=host)(USER=user))(SID=sid)) *
(ADDRESS=(PROTOCOL=tcp)(HOST=host)(PORT=port)) * establish * ORCL * 0
```

When `PROTOCOL` has the value `tcp` for an entry, it shows an SSL connection. However, when `HOST` is `127.0.0.1`, you can ignore the entry. Connections from `127.0.0.1` are a local management agent on the DB instance. These connections aren't external SSL connections. Therefore, you have applications connecting using SSL if you see listener log entries where `PROTOCOL` is `tcp` and `HOST` is *not* `127.0.0.1`.

To check the listener log, you can publish the log to Amazon CloudWatch Logs. For more information, see [Publishing Oracle logs to Amazon CloudWatch Logs \(p. 553\)](#).

## Updating your application trust store

You can update the trust store for applications that use SQL\*Plus or JDBC for SSL/TLS connections.

### Updating your application trust store for SQL\*Plus

You can update the trust store for applications that use SQL\*Plus for SSL/TLS connections.

#### Note

When you update the trust store, you can retain older certificates in addition to adding the new certificates.

#### To update the trust store for SQL\*Plus applications

1. Download the 2019 root certificate that works for all AWS Regions and put the file in the `ssl_wallet` directory.

For information about downloading the root certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

2. Run the following command to update the Oracle wallet.

```
prompt>orapki wallet add -wallet $ORACLE_HOME/ssl_wallet -trusted_cert -cert
$ORACLE_HOME/ssl_wallet/rds-ca-2019-root.pem -auto_login_only
```

Replace the file name with the one that you downloaded.

3. Run the following command to confirm that the wallet was updated successfully.

```
prompt>orapki wallet display -wallet $ORACLE_HOME/ssl_wallet
```

Your output should contain the following.

```
Trusted Certificates:
Subject: CN=Amazon RDS Root 2019 CA,OU=Amazon RDS,O=Amazon Web Services\,
Inc.,L=Seattle,ST=Washington,C=US
```

### Updating your application trust store for JDBC

You can update the trust store for applications that use JDBC for SSL/TLS connections.

#### To update the trust store for JDBC applications

1. Download the 2019 root certificate that works for all AWS Regions and put the file in the `ssl_wallet` directory.

For information about downloading the root certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

2. Convert the certificate to .der format using the following command.

```
openssl x509 -outform der -in rds-ca-2019-root.pem -out rds-ca-2019-root.der
```

Replace the file name with the one that you downloaded.

3. Import the certificate into the key store using the following command.

```
keytool -import -alias rds-root -keystore clientkeystore -file rds-ca-2019-root.der
```

4. Confirm that the key store was updated successfully.

```
keytool -list -v -keystore clientkeystore.jks
```

Enter the key store password when you are prompted for it.

Your output should contain the following.

```
rds-root, date, trustedCertEntry,
Certificate fingerprint (SHA1):
D4:0D:DB:29:E3:75:0D:FF:A6:71:C3:14:0B:BF:5F:47:8D:1C:80:96
This fingerprint should match the output from the below command
openssl x509 -fingerprint -in rds-ca-2019-root.pem -noout
```

## Example Java code for establishing SSL connections

The following code example shows how to set up the SSL connection using JDBC.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.util.Properties;

public class OracleSslConnectionTest {
 private static final String DB_SERVER_NAME = "<dns-name-provided-by-amazon-rds>";
 private static final Integer SSL_PORT = "<ssl-option-port-configured-in-option-group>";
 private static final String DB_SID = "<oracle-sid>";
 private static final String DB_USER = "<user name>";
 private static final String DB_PASSWORD = "<password>";
 // This key store has only the prod root ca.
 private static final String KEY_STORE_FILE_PATH = "<file-path-to-keystore>";
 private static final String KEY_STORE_PASS = "<keystore-password>";

 public static void main(String[] args) throws SQLException {
 final Properties properties = new Properties();
 final String connectionString = String.format(
 "jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCPS)(HOST=%s)(PORT=%d))" +
 "(CONNECT_DATA=(SID=%s)))",
 DB_SERVER_NAME, SSL_PORT, DB_SID);
 properties.put("user", DB_USER);
 properties.put("password", DB_PASSWORD);
 properties.put("oracle.jdbc.J2EE13Compliant", "true");
 properties.put("javax.net.ssl.trustStore", KEY_STORE_FILE_PATH);
 properties.put("javax.net.ssl.trustStoreType", "JKS");
 properties.put("javax.net.ssl.trustStorePassword", KEY_STORE_PASS);
 final Connection connection = DriverManager.getConnection(connectionString,
 properties);
 // If no exception, that means handshake has passed, and an SSL connection can be
 opened
 }
}
```

**Important**

After you have determined that your database connections use SSL/TLS and have updated your application trust store, you can update your database to use the rds-ca-2019 certificates. For instructions, see step 3 in [Updating your CA certificate by modifying your DB instance \(p. 1674\)](#).

## Configuring Kerberos authentication for Amazon RDS for Oracle

You can use Kerberos authentication to authenticate users when they connect to your Amazon RDS DB instance running Oracle. In this configuration, your DB instance works with AWS Directory Service for Microsoft Active Directory, also called AWS Managed Microsoft AD. When users authenticate with an Oracle DB instance joined to the trusting domain, authentication requests are forwarded to the directory that you create with AWS Directory Service.

Keeping all of your credentials in the same directory can save you time and effort. You have a centralized place for storing and managing credentials for multiple database instances. A directory can also improve your overall security profile.

Amazon RDS supports Kerberos authentication for Oracle DB instances in the following AWS Regions:

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Ireland)
- Europe (London)
- Europe (Stockholm)
- South America (São Paulo)
- AWS GovCloud (US-East)
- AWS GovCloud (US-West)

**Note**

Kerberos authentication isn't supported for DB instance classes that are deprecated for Oracle DB instances. For more information, see [RDS for Oracle instance classes \(p. 1002\)](#).

### Topics

- [Setting up Kerberos authentication for Oracle DB instances \(p. 1027\)](#)
- [Managing a DB instance in a domain \(p. 1035\)](#)
- [Connecting to Oracle with Kerberos authentication \(p. 1037\)](#)

## Setting up Kerberos authentication for Oracle DB instances

Use AWS Directory Service for Microsoft Active Directory, also called AWS Managed Microsoft AD, to set up Kerberos authentication for an Oracle DB instance. To set up Kerberos authentication, complete the following steps:

- [Step 1: Create a directory using the AWS Managed Microsoft AD \(p. 1027\)](#)
- [Step 2: Create a trust \(p. 1030\)](#)
- [Step 3: Create an IAM role for use by Amazon RDS \(p. 1030\)](#)
- [Step 4: Create and configure users \(p. 1031\)](#)
- [Step 5: Enable cross-VPC traffic between the directory and the DB instance \(p. 1032\)](#)
- [Step 6: Create or modify an Oracle DB instance \(p. 1032\)](#)
- [Step 7: Create Kerberos authentication Oracle logins \(p. 1034\)](#)
- [Step 8: Configure an Oracle client \(p. 1034\)](#)

### **Note**

During the setup, RDS creates an Oracle database user named `managed_service_user@example.com` with the `CREATE SESSION` privilege, where `example.com` is your domain name. This user corresponds to the user that Directory Service creates inside your Managed Active Directory. Periodically, RDS uses the credentials provided by the Directory Service to log in to your Oracle database. Afterwards, RDS immediately destroys the ticket cache.

### Step 1: Create a directory using the AWS Managed Microsoft AD

AWS Directory Service creates a fully managed Active Directory in the AWS Cloud. When you create an AWS Managed Microsoft AD directory, AWS Directory Service creates two domain controllers and Domain Name System (DNS) servers on your behalf. The directory servers are created in different subnets in a VPC. This redundancy helps make sure that your directory remains accessible even if a failure occurs.

When you create an AWS Managed Microsoft AD directory, AWS Directory Service performs the following tasks on your behalf:

- Sets up an Active Directory within the VPC.
- Creates a directory administrator account with the user name Admin and the specified password. You use this account to manage your directory.

### **Note**

Be sure to save this password. AWS Directory Service doesn't store it. You can reset it, but you can't retrieve it.

- Creates a security group for the directory controllers.

When you launch an AWS Managed Microsoft AD, AWS creates an Organizational Unit (OU) that contains all of your directory's objects. This OU has the NetBIOS name that you typed when you created your directory and is located in the domain root. The domain root is owned and managed by AWS.

The Admin account that was created with your AWS Managed Microsoft AD directory has permissions for the most common administrative activities for your OU:

- Create, update, or delete users
- Add resources to your domain such as file or print servers, and then assign permissions for those resources to users in your OU
- Create additional OUs and containers

- Delegate authority
- Restore deleted objects from the Active Directory Recycle Bin
- Run AD and DNS Windows PowerShell modules on the Active Directory Web Service

The Admin account also has rights to perform the following domain-wide activities:

- Manage DNS configurations (add, remove, or update records, zones, and forwarders)
- View DNS event logs
- View security event logs

To create the directory, use the AWS Management Console, the AWS CLI, or the AWS Directory Service API. Make sure to open the relevant outbound ports on the directory security group so that the directory can communicate with the Oracle DB instance.

### To create a directory with AWS Managed Microsoft AD

1. Sign in to the AWS Management Console and open the AWS Directory Service console at <https://console.aws.amazon.com/directoryservicev2/>.
2. In the navigation pane, choose **Directories** and choose **Set up Directory**.
3. Choose **AWS Managed Microsoft AD**. AWS Managed Microsoft AD is the only option that you can currently use with Amazon RDS.
4. Enter the following information:

#### Directory DNS name

The fully qualified name for the directory, such as **corp.example.com**.

#### Directory NetBIOS name

The short name for the directory, such as **CORP**.

#### Directory description

(Optional) A description for the directory.

#### Admin password

The password for the directory administrator. The directory creation process creates an administrator account with the user name Admin and this password.

The directory administrator password and can't include the word "admin." The password is case-sensitive and must be 8–64 characters in length. It must also contain at least one character from three of the following four categories:

- Lowercase letters (a–z)
- Uppercase letters (A–Z)
- Numbers (0–9)
- Non-alphanumeric characters (~!@#\$%^&\*\_-+=`|\{}{};:"<,>,.?/)

#### Confirm password

The administrator password retyped.

5. Choose **Next**.
6. Enter the following information in the **Networking** section and then choose **Next**:

#### VPC

The VPC for the directory. Create the Oracle DB instance in this same VPC.

## Subnets

Subnets for the directory servers. The two subnets must be in different Availability Zones.

7. Review the directory information and make any necessary changes. When the information is correct, choose **Create directory**.

## Review & create

Review	
Directory type	VPC
Microsoft AD	vpc-8b6b78e9 ( [REDACTED] )
Directory DNS name	Subnets
corp.example.com	subnet-75128d10 ( [REDACTED], us-east-1a )
Directory NetBIOS name	subnet-f51665dd ( [REDACTED], us-east-1b )
CORP	
Directory description	
My directory	
Pricing	
Edition	Free trial eligible <a href="#">Learn more</a>
Standard	30-day limited trial
~USD [REDACTED] *	
* Includes two domain controllers, USD [REDACTED] /mo for each additional domain controller.	
<a href="#">Cancel</a> <a href="#">Previous</a> <a href="#">Create directory</a>	

It takes several minutes for the directory to be created. When it has been successfully created, the **Status** value changes to **Active**.

To see information about your directory, choose the directory name in the directory listing. Note the **Directory ID** value because you need this value when you create or modify your Oracle DB instance.

Directory Service > Directories > d-90670a8d36

Directory details		
Directory type	VPC	Status
Microsoft AD	vpc-6594f31c	Active
Edition	Subnets	Last updated

Directory DNS name	DNS address	
corp.example.com		
Directory NetBIOS name		
CORP		
Description - <a href="#">Edit</a>		
My directory		

[Application management](#) [Scale & share](#) [Networking & security](#) [Maintenance](#)

## Step 2: Create a trust

If you plan to use AWS Managed Microsoft AD only, move on to [Step 3: Create an IAM role for use by Amazon RDS \(p. 1030\)](#).

To get Kerberos authentication using an on-premises or self-hosted Microsoft Active Directory, create a forest trust or external trust. The trust can be one-way or two-way. For more information about setting up forest trusts using AWS Directory Service, see [When to create a trust relationship](#) in the *AWS Directory Service Administration Guide*.

## Step 3: Create an IAM role for use by Amazon RDS

For Amazon RDS to call AWS Directory Service for you, an IAM role that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess` is required. This role allows Amazon RDS to make calls to the AWS Directory Service.

### Note

For the role to allow access, the AWS Security Token Service (AWS STS) endpoint must be activated in the correct AWS Region for your AWS account. AWS STS endpoints are active by default in all AWS Regions, and you can use them without any further actions. For more information, see [Activating and deactivating AWS STS in an AWS Region](#) in the *IAM User Guide*.

When a DB instance is created using the AWS Management Console and the console user has the `iam:CreateRole` permission, the console creates this role automatically. In this case, the role name is `rds-directoryservice-kerberos-access-role`. Otherwise, you must create the IAM role

manually. When you create this IAM role, choose **Directory Service**, and attach the AWS managed policy `AmazonRDSDirectoryServiceAccess` to it.

For more information about creating IAM roles for a service, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.

**Note**

The IAM role used for Windows Authentication for RDS for Microsoft SQL Server can't be used for RDS for Oracle.

Optionally, you can create policies with the required permissions instead of using the managed IAM policy `AmazonRDSDirectoryServiceAccess`. In this case, the IAM role must have the following IAM trust policy.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "",
 "Effect": "Allow",
 "Principal": {
 "Service": [
 "directoryservice.rds.amazonaws.com",
 "rds.amazonaws.com"
]
 },
 "Action": "sts:AssumeRole"
 }
]
}
```

The role must also have the following IAM role policy.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Action": [
 "ds:DescribeDirectories",
 "ds:AuthorizeApplication",
 "ds:UnauthorizeApplication",
 "ds:GetAuthorizedApplicationDetails"
],
 "Effect": "Allow",
 "Resource": "*"
 }
]
}
```

## Step 4: Create and configure users

You can create users with the Active Directory Users and Computers tool, which is one of the Active Directory Domain Services and Active Directory Lightweight Directory Services tools. In this case, *users* are individual people or entities that have access to your directory.

To create users in an AWS Directory Service directory, you must be connected to a Windows-based Amazon EC2 instance that is a member of the AWS Directory Service directory. At the same time, you must be logged in as a user that has privileges to create users. For more information about creating users in your Microsoft Active Directory, see [Manage users and groups in AWS Managed Microsoft AD](#) in the *AWS Directory Service Administration Guide*.

## Step 5: Enable cross-VPC traffic between the directory and the DB instance

If you plan to locate the directory and the DB instance in the same VPC, skip this step and move on to [Step 6: Create or modify an Oracle DB instance \(p. 1032\)](#).

If you plan to locate the directory and the DB instance in different AWS accounts or VPCs, configure cross-VPC traffic using VPC peering or [AWS Transit Gateway](#). The following procedure enables traffic between VPCs using VPC peering. Follow the instructions in [What is VPC peering?](#) in the *Amazon Virtual Private Cloud Peering Guide*.

### To enable cross-VPC traffic using VPC peering

1. Set up appropriate VPC routing rules to ensure that network traffic can flow both ways.
2. Ensure that the DB instance's security group can receive inbound traffic from the directory's security group. For more information, see [Best practices for AWS Managed Microsoft AD](#) in the *AWS Directory Service Administration Guide*.
3. Ensure that there is no network access control list (ACL) rule to block traffic.

If a different AWS account owns the directory, you must share the directory.

### To share the directory between AWS accounts

1. Start sharing the directory with the AWS account that the DB instance will be created in by following the instructions in [Tutorial: Sharing your AWS Managed Microsoft AD directory for seamless EC2 Domain-join](#) in the *AWS Directory Service Administration Guide*.
2. Sign in to the AWS Directory Service console using the account for the DB instance, and ensure that the domain has the **SHARED** status before proceeding.
3. While signed into the AWS Directory Service console using the account for the DB instance, note the **Directory ID** value. You use this directory ID to join the DB instance to the domain.

## Step 6: Create or modify an Oracle DB instance

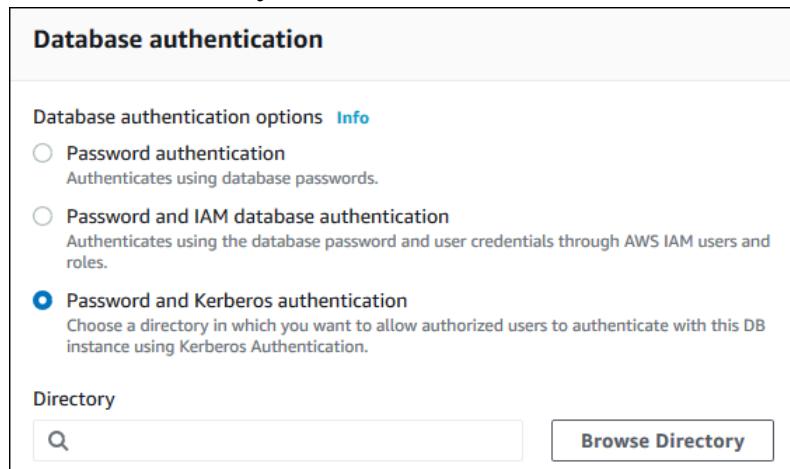

Create or modify an Oracle DB instance for use with your directory. You can use the console, CLI, or RDS API to associate a DB instance with a directory. You can do this in one of the following ways:

- Create a new Oracle DB instance using the console, the `create-db-instance` CLI command, or the `CreateDBInstance` RDS API operation.  
For instructions, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- Modify an existing Oracle DB instance using the console, the `modify-db-instance` CLI command, or the `ModifyDBInstance` RDS API operation.  
For instructions, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- Restore an Oracle DB instance from a DB snapshot using the console, the `restore-db-instance-from-db-snapshot` CLI command, or the `RestoreDBInstanceFromDBSnapshot` RDS API operation.  
For instructions, see [Restoring from a DB snapshot \(p. 352\)](#).
- Restore an Oracle DB instance to a point-in-time using the console, the `restore-db-instance-to-point-in-time` CLI command, or the `RestoreDBInstanceToPointInTime` RDS API operation.  
For instructions, see [Restoring a DB instance to a specified time \(p. 392\)](#).

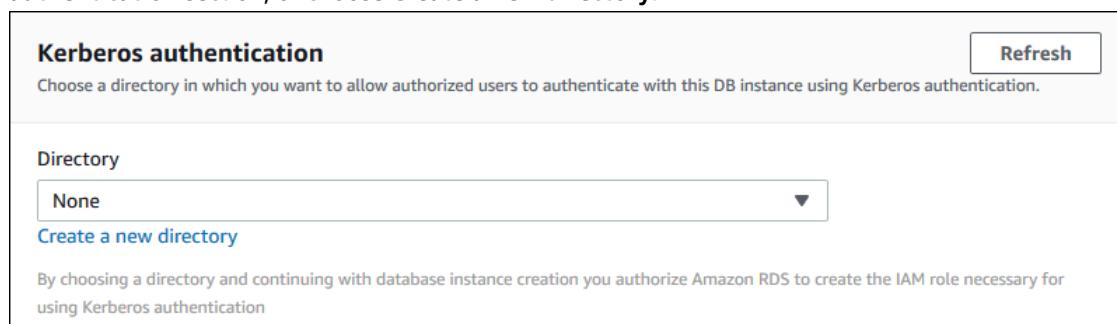

Kerberos authentication is only supported for Oracle DB instances in a VPC. The DB instance can be in the same VPC as the directory, or in a different VPC. When you create or modify the DB instance, do the following:

- Provide the domain identifier (d-\* identifier) that was generated when you created your directory.
- Provide the name of the IAM role that you created.
- Ensure that the DB instance security group can receive inbound traffic from the directory security group and send outbound traffic to the directory.

When you use the console to create a DB instance, choose **Password and Kerberos authentication** in the **Database authentication** section. Choose **Browse Directory** and then select the directory, or choose **Create a new directory**.

When you use the console to modify or restore a DB instance, choose the directory in the **Kerberos authentication** section, or choose **Create a new directory**.

When you use the AWS CLI, the following parameters are required for the DB instance to be able to use the directory that you created:

- For the `--domain` parameter, use the domain identifier ("d-\*" identifier) generated when you created the directory.
- For the `--domain-iam-role-name` parameter, use the role you created that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess`.

For example, the following CLI command modifies a DB instance to use a directory.

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
 --db-instance-identifier mydbinstance \
 --domain d-ID \
 --domain-iam-role-name role-name
```

For Windows:

```
aws rds modify-db-instance ^
--db-instance-identifier mydbinstance ^
--domain d-ID ^
--domain-iam-role-name role-name
```

**Important**

If you modify a DB instance to enable Kerberos authentication, reboot the DB instance after making the change.

**Note**

*MANAGED\_SERVICE\_USER* is a service account whose name is randomly generated by Directory Service for RDS. During the Kerberos authentication setup, RDS for Oracle creates a user with the same name and assigns it the CREATE SESSION privilege. The Oracle DB user is identified externally as *MANAGED\_SERVICE\_USER@EXAMPLE.COM*, where *EXAMPLE.COM* is the name of your domain. Periodically, RDS uses the credentials provided by the Directory Service to log in to your Oracle database. Afterward, RDS immediately destroys the ticket cache.

## Step 7: Create Kerberos authentication Oracle logins

Use the Amazon RDS master user credentials to connect to the Oracle DB instance as you do any other DB instance. The DB instance is joined to the AWS Managed Microsoft AD domain. Thus, you can provision Oracle logins and users from the Microsoft Active Directory users and groups in your domain. To manage database permissions, you grant and revoke standard Oracle permissions to these logins.

### To allow a Microsoft Active Directory user to authenticate with Oracle

1. Connect to the Oracle DB instance using your Amazon RDS master user credentials.
2. Create an externally authenticated user in Oracle database.

In the following example, replace *KRBUSER@CORP.EXAMPLE.COM* with the user name and domain name.

```
CREATE USER "KRBUSER@CORP.EXAMPLE.COM" IDENTIFIED EXTERNALLY;
GRANT CREATE SESSION TO "KRBUSER@CORP.EXAMPLE.COM";
```

Users (both humans and applications) from your domain can now connect to the Oracle DB instance from a domain joined client machine using Kerberos authentication.

## Step 8: Configure an Oracle client

To configure an Oracle client, meet the following requirements:

- Create a configuration file named krb5.conf (Linux) or krb5.ini (Windows) to point to the domain. Configure the Oracle client to use this configuration file.
- Verify that traffic can flow between the client host and AWS Directory Service over DNS port 53 and Kerberos ports (88 and 464 for managed AWS Directory Service) over TCP/UDP.
- Verify that traffic can flow between the client host and the DB instance over the database port.

Following is sample content for AWS Managed Microsoft AD.

```
[libdefaults]
default_realm = EXAMPLE.COM
[realms]
EXAMPLE.COM = {
 kdc = example.com
```

```
 admin_server = example.com
}
[domain_realm]
.example.com = EXAMPLE.COM
example.com = EXAMPLE.COM
```

Following is sample content for on-premise Microsoft AD. In your krb5.conf or krb5.ini file, replace *on-prem-ad-server-name* with the name of your on-premises AD server.

```
[libdefaults]
default_realm = ONPREM.COM
[realms]
AWSAD.COM = {
 kdc = awsad.com
 admin_server = awsad.com
}
ONPREM.COM = {
 kdc = on-prem-ad-server-name
 admin_server = on-prem-ad-server-name
}
[domain_realm]
.awsad.com = AWSAD.COM
awsad.com= AWSAD.COM
.onprem.com = ONPREM.COM
onprem.com= ONPREM.COM
```

**Note**

After you configure your krb5.ini or krb5.conf file, we recommend that you reboot the server.

The following is sample sqlnet.ora content for a SQL\*Plus configuration:

```
SQLNET.AUTHENTICATION_SERVICES=(KERBEROS5PRE, KERBEROS5)
SQLNET.KERBEROS5_CONF=path_to_krb5.conf_file
```

For an example of a SQL Developer configuration, see [Document 1609359.1](#) from Oracle Support.

## Managing a DB instance in a domain

You can use the console, the CLI, or the RDS API to manage your DB instance and its relationship with your Microsoft Active Directory. For example, you can associate a Microsoft Active Directory to enable Kerberos authentication. You can also disassociate a Microsoft Active Directory to disable Kerberos authentication. You can also move a DB instance to be externally authenticated by one Microsoft Active Directory to another.

For example, using the CLI, you can do the following:

- To reattempt enabling Kerberos authentication for a failed membership, use the [modify-db-instance](#) CLI command and specify the current membership's directory ID for the --domain option.
- To disable Kerberos authentication on a DB instance, use the [modify-db-instance](#) CLI command and specify none for the --domain option.
- To move a DB instance from one domain to another, use the [modify-db-instance](#) CLI command and specify the domain identifier of the new domain for the --domain option.

## Viewing the status of domain membership

After you create or modify your DB instance, the DB instance becomes a member of the domain. You can view the status of the domain membership for the DB instance in the console or by running the [describe-db-instances](#) CLI command. The status of the DB instance can be one of the following:

- **kerberos-enabled** – The DB instance has Kerberos authentication enabled.
- **enabling-kerberos** – AWS is in the process of enabling Kerberos authentication on this DB instance.
- **pending-enable-kerberos** – Enabling Kerberos authentication is pending on this DB instance.
- **pending-maintenance-enable-kerberos** – AWS will attempt to enable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- **pending-disable-kerberos** – Disabling Kerberos authentication is pending on this DB instance.
- **pending-maintenance-disable-kerberos** – AWS will attempt to disable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- **enable-kerberos-failed** – A configuration problem has prevented AWS from enabling Kerberos authentication on the DB instance. Correct the configuration problem before reissuing the command to modify the DB instance.
- **disabling-kerberos** – AWS is in the process of disabling Kerberos authentication on this DB instance.

A request to enable Kerberos authentication can fail because of a network connectivity issue or an incorrect IAM role. If the attempt to enable Kerberos authentication fails when you create or modify a DB instance, make sure that you're using the correct IAM role. Then modify the DB instance to join the domain.

**Note**

Only Kerberos authentication with Amazon RDS for Oracle sends traffic to the domain's DNS servers. All other DNS requests are treated as outbound network access on your DB instances running Oracle. For more information about outbound network access with Amazon RDS for Oracle, see [Setting up a custom DNS server \(p. 1057\)](#).

## Force-rotating Kerberos keys

A secret key is shared between AWS Managed Microsoft AD and Amazon RDS for Oracle DB instance. This key is rotated automatically every 45 days. You can use the following Amazon RDS procedure to force the rotation of this key.

```
SELECT rdsadmin.rdsadmin_kerberos_auth_tasks.rotate_kerberos_keytab AS TASK_ID FROM DUAL;
```

**Note**

In a read replica configuration, this procedure is available only on the source DB instance and not on the read replica.

The `SELECT` statement returns the ID of the task in a `VARCHAR2` data type. You can view the status of an ongoing task in a `bdump` file. The `bdump` files are located in the `/rdsdbdata/log/trace` directory. Each `bdump` file name is in the following format.

```
dbtask-task-id.log
```

You can view the result by displaying the task's output file.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-task-id.log'));
```

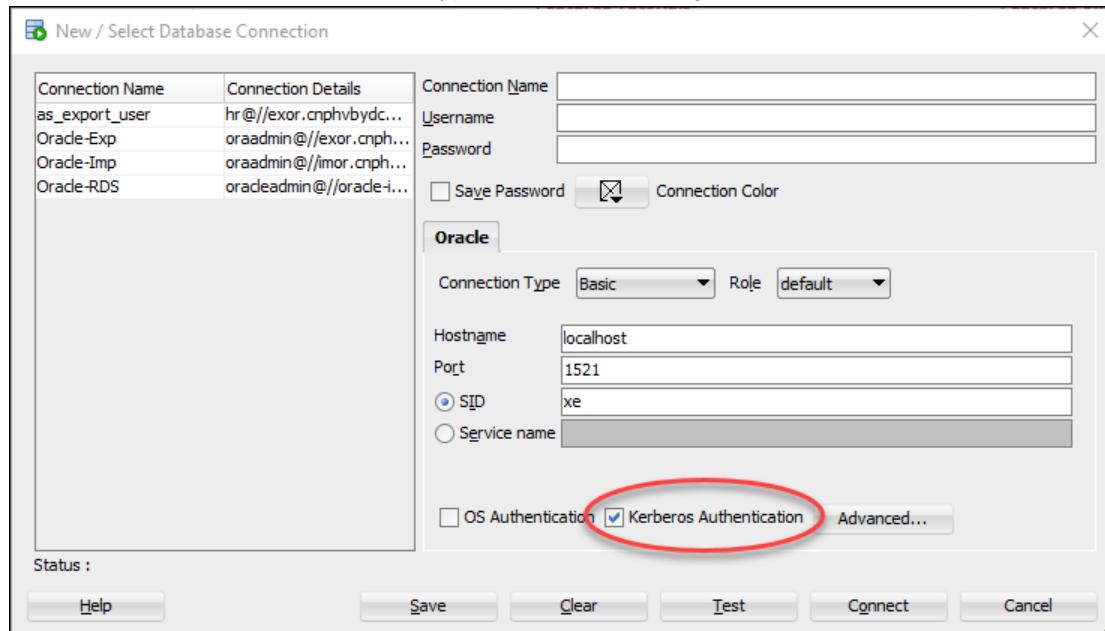

Replace `task-id` with the task ID returned by the procedure.

**Note**

Tasks are executed asynchronously.

## Connecting to Oracle with Kerberos authentication

This section assumes that you have set up your Oracle client as described in [Step 8: Configure an Oracle client \(p. 1034\)](#). To connect to the Oracle DB with Kerberos authentication, log in using the Kerberos authentication type. For example, after launching Oracle SQL Developer, choose **Kerberos Authentication** as the authentication type, as shown following.

To connect to Oracle with Kerberos authentication with SQL\*Plus:

1. At a command prompt, run the following command:

```
kinit username
```

Replace *username* with the user name and, at the prompt, enter the password stored in the Microsoft Active Directory for the user.

2. Open SQL\*Plus and connect using the DNS name and port number for the Oracle DB instance.

For more information about connecting to an Oracle DB instance in SQL\*Plus, see [Connecting to your DB instance using SQL\\*Plus \(p. 1017\)](#).

## Configuring outbound network access on your Oracle DB instance

Amazon RDS supports outbound network access on your Oracle DB instances. To connect your instance to the network, you can use the following PL/SQL packages:

- **UTL\_HTTP** – makes HTTP callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP. For more information, see [UTL\\_HTTP](#) in the Oracle documentation.
- **UTL\_TCP** – provides TCP/IP client-side access functionality in PL/SQL. This package is useful to PL/SQL applications that use Internet protocols and email. For more information, see [UTL\\_TCP](#) in the Oracle documentation.

- **UTL\_SMTP** – provides interfaces to the SMTP commands that enable a client to dispatch emails to an SMTP server. For more information, see [UTL\\_SMTP](#) in the Oracle documentation.

Note the following about working with outbound network access:

- Outbound network access with **UTL\_HTTP**, **UTL\_TCP**, and **UTL\_SMTP** is supported only for Oracle DB instances in a VPC. To determine whether or not your DB instance is in a VPC, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#). To move a DB instance not in a VPC into a VPC, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).
- To use SMTP with the **UTL\_MAIL** option, see [Oracle UTL\\_MAIL \(p. 1218\)](#).
- The Domain Name Server (DNS) name of the remote host can be any of the following:
  - Publicly resolvable.
  - The endpoint of an Amazon RDS DB instance.
  - Resolvable through a custom DNS server. For more information, see [Setting up a custom DNS server \(p. 1057\)](#).
  - The private DNS name of an Amazon EC2 instance in the same VPC or a peered VPC. In this case, make sure that the name is resolvable through a custom DNS server. Alternatively, to use the DNS provided by Amazon, you can enable the `enableDnsSupport` attribute in the VPC settings and enable DNS resolution support for the VPC peering connection. For more information, see [DNS support in your VPC](#) and [Modifying your VPC peering connection](#).

To connect securely to remote SSL/TLS resources, you can create and upload customized Oracle wallets. By using the Amazon S3 integration with Amazon RDS for Oracle feature, you can download a wallet from Amazon S3 into Oracle DB instances. For information about Amazon S3 integration for Oracle, see [Amazon S3 integration \(p. 1139\)](#).

### To create a wallet for accessing an HTTP address over UTL\_HTTP

1. Obtain the certificate for **Amazon Root CA 1** from the [Amazon trust services repository](#).
2. Create a new wallet and add the following certificate:

```
orapki wallet create -wallet . -auto_login_only
orapki wallet add -wallet . -trusted_cert -cert AmazonRootCA1.pem -auto_login_only
orapki wallet display -wallet .
```

3. Upload the wallet to your Amazon S3 bucket.
4. Complete the prerequisites for Amazon S3 integration with Oracle, and add the **S3\_INTEGRATION** option to your Oracle DB instance. Ensure that the IAM role for the option has access to the Amazon S3 bucket you are using.

For more information, see [Amazon S3 integration \(p. 1139\)](#).

5. Connect to the DB instance, and create a directory in the database to hold the wallet. The following example creates a directory called **SSL\_WALLET**:

```
EXEC rdsadmin.rdsadmin_util.create_directory('SSL_WALLET');
```

6. Download the wallet from your Amazon S3 bucket to the Oracle DB instance.

The following example downloads a wallet to the DB instance directory **SSL\_WALLET**:

```
SELECT rdsadmin.rdsadmin_s3_tasks.download_from_s3(
 p_bucket_name => 'bucket_name',
 p_s3_prefix => 'wallet_name',
 p_directory_name => 'SSL_WALLET')
```

```
AS TASK_ID FROM DUAL;
```

Replace `bucket_name` with the name of the bucket you are using, and replace `wallet_name` with the name of the wallet.

7. Set this wallet for `utl_http` transactions by running the following procedure:

```
DECLARE
 l_wallet_path all_directories.directory_path%type;
BEGIN
 select directory_path into l_wallet_path from all_directories
 where upper(directory_name)='SSL_WALLET';

 utl_http.set_wallet('file://' || l_wallet_path);
END;
```

8. Access the URL from above over SSL/TLS. The following example accesses `https://status.aws.amazon.com/robots.txt`.

```
SELECT utl_http.request('https://status.aws.amazon.com/robots.txt') AS ROBOTS_TXT FROM
DUAL;

ROBOTS_TXT

User-agent: *
Allow: /
```

#### Note

The specific certificates that are required for your wallet vary by service. For AWS services, the certificates can typically be found in the [Amazon trust services repository](#).

You can use a similar setup to send emails through `UTL_SMTP` over SSL/TLS (including [Amazon Simple Email Service](#)).

You can establish database links between Oracle DB instances over an SSL/TLS endpoint if the Oracle SSL option is configured for each instance. No further configuration is required. For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

# Administering your Oracle DB instance

Following are the common management tasks you perform with an Amazon RDS DB instance. Some tasks are the same for all RDS DB instances. Other tasks are specific to RDS for Oracle.

The following tasks are common to all RDS databases, but Oracle has special considerations. For example, connect to an Oracle Database using the Oracle clients SQL\*Plus and SQL Developer.

Task area	Relevant documentation
<b>Instance Classes, Storage, and PIOPS</b>  If you are creating a production instance, learn how instance classes, storage types, and Provisioned IOPS work in Amazon RDS.	<a href="#">RDS for Oracle instance classes (p. 1002)</a>  <a href="#">Amazon RDS storage types (p. 40)</a>
<b>Multi-AZ Deployments</b>  A production DB instance should use Multi-AZ deployments. Multi-AZ deployments provide increased availability, data durability, and fault tolerance for DB instances.	<a href="#">High availability (Multi-AZ) for Amazon RDS (p. 52)</a>
<b>Amazon Virtual Private Cloud (VPC)</b>  If your AWS account has a default VPC, then your DB instance is automatically created inside the default VPC. If your account doesn't have a default VPC, and you want the DB instance in a VPC, create the VPC and subnet groups before you create the instance.	<a href="#">Determining whether you are using the EC2-VPC or EC2-Classic platform (p. 1756)</a>  <a href="#">Working with a DB instance in a VPC (p. 1765)</a>
<b>Security Groups</b>  By default, DB instances use a firewall that prevents access. Make sure you create a security group with the correct IP addresses and network configuration to access the DB instance. The security group you create depends on which Amazon EC2 platform your DB instance is on, and whether you will access your DB instance from an Amazon EC2 instance.  In general, if your DB instance is on the EC2-Classic platform, you should create a DB security group. Also, if your instance is on the EC2-VPC platform, you should create a VPC security group.	<a href="#">Determining whether you are using the EC2-VPC or EC2-Classic platform (p. 1756)</a>  <a href="#">Controlling access with security groups (p. 1737)</a>
<b>Parameter Groups</b>  If your DB instance is going to require specific database parameters, you should create a parameter group before you create the DB instance.	<a href="#">Working with DB parameter groups (p. 229)</a>
<b>Option Groups</b>  If your DB instance will require specific database options, you should create an option group before you create the DB instance.	<a href="#">Adding options to Oracle DB instances (p. 1138)</a>
<b>Connecting to Your DB Instance</b>  After creating a security group and associating it to a DB instance, you can connect to the DB instance using any standard SQL client application such as Oracle SQL*Plus.	<a href="#">Connecting to your Oracle DB instance (p. 1013)</a>

Task area	Relevant documentation
<b>Backup and Restore</b>  You can configure your DB instance to take automated backups, or take manual snapshots, and then restore instances from the backups or snapshots.	<a href="#">Backing up and restoring an Amazon RDS DB instance (p. 329)</a>
<b>Monitoring</b>  You can monitor an Oracle DB instance by using CloudWatch Amazon RDS metrics, events, and enhanced monitoring.	<a href="#">Viewing DB instance metrics (p. 414)</a>  <a href="#">Viewing Amazon RDS events (p. 503)</a>
<b>Log Files</b>  You can access the log files for your Oracle DB instance.	<a href="#">Working with Amazon RDS database log files (p. 524)</a>

Following, you can find a description for Amazon RDS–specific implementations of common DBA tasks for RDS Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances, and restricts access to certain system procedures and tables that require advanced privileges. In many of the tasks, you run the `rdsadmin` package, which is an Amazon RDS–specific tool that enables you to administer your database.

The following are common DBA tasks for DB instances running Oracle:

- [System tasks \(p. 1048\)](#)

<a href="#">Disconnecting a session (p. 1048)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.disconnect</code>  Oracle method: <code>alter system disconnect session</code>
<a href="#">Terminating a session (p. 1049)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.kill</code>  Oracle method: <code>alter system kill session</code>
<a href="#">Canceling a SQL statement in a session (p. 1050)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.cancel</code>  Oracle method: <code>alter system cancel sql</code>
<a href="#">Enabling and disabling restricted sessions (p. 1050)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.restricted_session</code>  Oracle method: <code>alter system enable restricted session</code>
<a href="#">Flushing the shared pool (p. 1051)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.flush_shared_pool</code>  Oracle method: <code>alter system flush shared_pool</code>
<a href="#">Flushing the buffer cache (p. 1051)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.flush_buffer_cache</code>  Oracle method: <code>alter system flush buffer_cache</code>
<a href="#">Granting SELECT or EXECUTE privileges to SYS objects (p. 1051)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.grant_sys_object</code>  Oracle method: <code>grant</code>

<a href="#">Revoking SELECT or EXECUTE privileges on SYS objects (p. 1053)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.revoke_sys_object</code>  Oracle method: <code>REVOKE</code>
<a href="#">Granting privileges to non-master users (p. 1054)</a>	Amazon RDS method: <code>GRANT</code>  Oracle method: <code>GRANT</code>
<a href="#">Creating custom functions to verify passwords (p. 1054)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_password_verify.create_verify_function</code>  Amazon RDS method: <code>rdsadmin.rdsadmin_password_verify.create_passthrough_verify_fcn</code>
<a href="#">Setting up a custom DNS server (p. 1057)</a>	—
<a href="#">Listing allowed system diagnostic events (p. 1059)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.list_allowed_system_events</code>  Oracle method: —
<a href="#">Setting system diagnostic events (p. 1059)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.set_allowed_system_events</code>  Oracle method: <code>ALTER SYSTEM SET EVENTS 'set_event_clause'</code>
<a href="#">Listing system diagnostic events that are set (p. 1060)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.list_set_system_events</code>  Oracle method: <code>ALTER SESSION SET EVENTS 'IMMEDIATE EVENTDUMP(SYSTEM)'</code>
<a href="#">Unsetting system diagnostic events (p. 1061)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.unset_system_event</code>  Oracle method: <code>ALTER SYSTEM SET EVENTS 'unset_event_clause'</code>

- [Database tasks \(p. 1061\)](#)

<a href="#">Changing the global name of a database (p. 1062)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.rename_global_name</code>  Oracle method: <code>ALTER DATABASE RENAME</code>
<a href="#">Creating and sizing tablespaces (p. 1062)</a>	Amazon RDS method: <code>CREATE TABLESPACE</code>  Oracle method: <code>ALTER DATABASE</code>
<a href="#">Setting the default tablespace (p. 1063)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.alter_default_tablespace</code>  Oracle method: <code>ALTER DATABASE DEFAULT TABLESPACE</code>

<a href="#">Setting the default temporary tablespace (p. 1063)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.alter_default_temp_tablespace</code>  Oracle method: <code>alter database default temporary tablespace</code>
<a href="#">Checkpointing a database (p. 1063)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.checkpoint</code>  Oracle method: <code>alter system checkpoint</code>
<a href="#">Setting distributed recovery (p. 1063)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.enable_distr_recovery</code>  Oracle method: <code>alter system enable distributed recovery</code>
<a href="#">Setting the database time zone (p. 1064)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.alter_db_time_zone</code>  Oracle method: <code>alter database set time_zone</code>
<a href="#">Working with Oracle external tables (p. 1064)</a>	—
<a href="#">Generating performance reports with Automatic Workload Repository (AWR) (p. 1065)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_diagnostic_util</code> procedures  Oracle method: <code>dbms_workload_repository</code> package
<a href="#">Adjusting database links for use with DB instances in a VPC (p. 1069)</a>	—
<a href="#">Setting the default edition for a DB instance (p. 1069)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.alter_default_edition</code>  Oracle method: <code>alter database default edition</code>
<a href="#">Enabling auditing for the SYS.AUD\$ table (p. 1069)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_master_util.audit_all_sys_aud_table</code>  Oracle method: <code>audit</code>
<a href="#">Disabling auditing for the SYS.AUD\$ table (p. 1070)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_master_util.noaudit_all_sys_aud_table</code>  Oracle method: <code>noaudit</code>
<a href="#">Cleaning up interrupted online index builds (p. 1070)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_dbms_repair.online_index_clean</code>  Oracle method: <code>dbms_repair.online_index_clean</code>
<a href="#">Skipping corrupt blocks (p. 1071)</a>	Amazon RDS method: Several <code>rdsadmin.rdsadmin_dbms_repair</code> procedures  Oracle method: <code>dbms_repair</code> package

Resizing the temporary tablespace in a read replica (p. 1073)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.resize_temp_tablespace</code> or <code>rdsadmin.rdsadmin_util.resize_tempfile</code> procedure  Oracle method:—
Purging the recycle bin (p. 1074)	Amazon RDS method: <code>exec rdsadmin.rdsadmin_util.purge_dba_recyclebin</code>  Oracle method: <code>purge dba_recyclebin</code>

- [Log tasks \(p. 1074\)](#)

Setting force logging (p. 1075)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.force_logging</code>  Oracle method: <code>alter database force logging</code>
Setting supplemental logging (p. 1075)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.alter_supple</code>  Oracle method: <code>alter database add supplemental log</code>
Switching online log files (p. 1076)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.switch_logfi</code>  Oracle method: <code>alter system switch logfile</code>
Adding online redo logs (p. 1076)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.add_logfile</code>
Dropping online redo logs (p. 1077)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.drop_logfile</code>
Resizing online redo logs (p. 1077)	—
Retaining archived redo logs (p. 1079)	Amazon RDS method: <code>rdsadmin.rdsadmin_util.set_configur</code>
Accessing transaction logs (p. 1080)	Amazon RDS method: <code>rdsadmin.rdsadmin_master_util.creat</code>  Amazon RDS method: <code>rdsadmin.rdsadmin_master_util.creat</code>

- [RMAN tasks \(p. 1081\)](#)

<a href="#">Validating DB instance files (p. 1085)</a>	Amazon RDS method: <code>rdsadmin_rman_util.procedure</code>  Oracle method: <code>RMAN VALIDATE</code>
<a href="#">Enabling and disabling block change tracking (p. 1088)</a>	Amazon RDS method: <code>rdsadmin_rman_util.procedure</code>  Oracle method: <code>ALTER DATABASE</code>
<a href="#">Crosschecking archived redo logs (p. 1089)</a>	Amazon RDS method: <code>rdsadmin_rman_util.crosscheck_archi</code>  Oracle method: <code>RMAN BACKUP</code>
<a href="#">Backing up archived redo logs (p. 1090)</a>	Amazon RDS method: <code>rdsadmin_rman_util.procedure</code>  Oracle method: <code>RMAN BACKUP</code>
<a href="#">Performing a full database backup (p. 1095)</a>	Amazon RDS method: <code>rdsadmin_rman_util.backup_database</code>  Oracle method: <code>RMAN BACKUP</code>
<a href="#">Performing an incremental database backup (p. 1095)</a>	Amazon RDS method: <code>rdsadmin_rman_util.backup_database</code>  Oracle method: <code>RMAN BACKUP</code>
<a href="#">Performing a tablespace backup (p. 1096)</a>	Amazon RDS method: <code>rdsadmin_rman_util.backup_database</code>  Oracle method: <code>RMAN BACKUP</code>

- [Oracle Scheduler tasks \(p. 1097\)](#)

<a href="#">Modifying DBMS_SCHEDULER jobs (p. 1098)</a>	Amazon RDS method: <code>dbms_scheduler.set_attribute</code>  Oracle method: <code>dbms_scheduler.set_attribute</code>
<a href="#">Setting the time zone for Oracle Scheduler jobs (p. 1099)</a>	Amazon RDS method: <code>dbms_scheduler.set_attribute</code>  Oracle method: <code>dbms_scheduler.set_attribute</code>

<a href="#">Disabling SYS-owned Oracle Scheduler jobs (p. 1100)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_dbms_scheduler.disable</code>  Oracle method: <code>dbms_scheduler.disable</code>
<a href="#">Enabling SYS-owned Oracle Scheduler jobs (p. 1100)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_dbms_scheduler.enable</code>  Oracle method: <code>dbms_scheduler.enable</code>
<a href="#">Modifying the repeat interval for jobs of CALENDAR type (p. 1100)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_dbms_scheduler.set_attribute</code>  Oracle method: <code>dbms_scheduler.set_attribute</code>
<a href="#">Modifying the repeat interval for jobs of NAMED type (p. 1101)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_dbms_scheduler.set_attribute</code>  Oracle method: <code>dbms_scheduler.set_attribute</code>

- [Diagnostic tasks \(p. 1101\)](#)

<a href="#">Listing incidents (p. 1102)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_adrci_util.list_incident</code>  Oracle method: ADRCI command <code>show incident</code>
<a href="#">Listing problems (p. 1104)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_adrci_util.list_problem</code>  Oracle method: ADRCI command <code>show problem</code>
<a href="#">Creating incident packages (p. 1105)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_adrci_util.create_ipspack</code>  Oracle method: ADRCI command <code>ips create package</code>
<a href="#">Showing trace files (p. 1106)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_adrci_util.show_tracefile</code>  Oracle method: ADRCI command <code>show tracefile</code>

- [Other tasks \(p. 1108\)](#)

<a href="#">Creating and dropping directories in the main data storage space (p. 1108)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.create_directory</code>  Oracle method: <code>CREATE DIRECTORY</code>  Amazon RDS method: <code>rdsadmin.rdsadmin_util.drop_directory</code>  Oracle method: <code>DROP DIRECTORY</code>
<a href="#">Listing files in a DB instance directory (p. 1109)</a>	Amazon RDS method: <code>rdsadmin.rds_file_util.listdir</code>  Oracle method: —
<a href="#">Reading files in a DB instance directory (p. 1109)</a>	Amazon RDS method: <code>rdsadmin.rds_file_util.read_text_file</code>  Oracle method: —
<a href="#">Accessing Opatch files (p. 1110)</a>	Amazon RDS method: <code>rdsadmin.rds_file_util.read_text_file</code> or <code>rdsadmin.tracefile_listing</code>  Oracle method: <code>opatch</code>
<a href="#">Setting parameters for advisor tasks (p. 1112)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.advisor_task</code>  Oracle method: Various stored package procedures
<a href="#">Disabling AUTO_STATS_ADVISOR_TASK (p. 1113)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.advisor_task</code>  Oracle method: —
<a href="#">Re-enabling AUTO_STATS_ADVISOR_TASK (p. 1113)</a>	Amazon RDS method: <code>rdsadmin.rdsadmin_util.dbms_stats_initialize</code>  Oracle method: —
<a href="#">Enabling HugePages for an Oracle DB instance (p. 1114)</a>	Amazon RDS method: <code>use_large_pages</code> RDS parameter  Oracle method: <code>use_large_pages</code> initialization parameter

[Enabling extended data types \(p. 1116\)](#)

Amazon RDS method:  
`max_string_size` RDS parameter

Oracle method:  
`max_string_size` initialization parameter

You can also use Amazon RDS procedures for Amazon S3 integration with Oracle and for running OEM Management Agent database tasks. For more information, see [Amazon S3 integration \(p. 1139\)](#) and [Performing database tasks with the Management Agent \(p. 1172\)](#).

## Performing common system tasks for Oracle DB instances

Following, you can find how to perform certain common DBA tasks related to the system on your Amazon RDS DB instances running Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances, and restricts access to certain system procedures and tables that require advanced privileges.

- [Setting and unsetting system diagnostic events \(p. 1058\)](#)

## Disconnecting a session

To disconnect the current session by ending the dedicated server process, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.disconnect`. The `disconnect` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>sid</code>	number	—	Yes	The session identifier.
<code>serial</code>	number	—	Yes	The serial number of the session.

Parameter name	Data type	Default	Required	Description
method	varchar	'IMMEDIATE'	No	Valid values are 'IMMEDIATE' or 'POST_TRANSACTION'.

The following example disconnects a session.

```
begin
 rdsadmin.rdsadmin_util.disconnect(
 sid => sid,
 serial => serial_number);
end;
/
```

To get the session identifier and the session serial number, query the `V$SESSION` view. The following example gets all sessions for the user `AWSUSER`.

```
select SID, SERIAL#, STATUS from V$SESSION where USERNAME = 'AWSUSER';
```

The database must be open to use this method. For more information about disconnecting a session, see [ALTER SYSTEM](#) in the Oracle documentation.

## Terminating a session

To terminate a session, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.kill`. The `kill` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
sid	number	—	Yes	The session identifier.
serial	number	—	Yes	The serial number of the session.
method	varchar	null	No	Valid values are 'IMMEDIATE' or 'PROCESS'.

The following example terminates a session.

```
begin
 rdsadmin.rdsadmin_util.kill(
 sid => sid,
 serial => serial_number);
end;
/
```

To get the session identifier and the session serial number, query the `V$SESSION` view. The following example gets all sessions for the user `AWSUSER`.

```
SELECT SID, SERIAL#, STATUS FROM V$SESSION WHERE USERNAME = 'AWSUSER';
```

You can specify either `IMMEDIATE` or `PROCESS` as a value for the `method` parameter. By specifying `PROCESS` as the `method` value, you can terminate the processes associated with a session. Do this only if terminating the session using `IMMEDIATE` as the `method` value was unsuccessful.

## Canceling a SQL statement in a session

To cancel a SQL statement in a session, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.cancel`.

### Note

This procedure is supported for Oracle Database 18c (18.0.0.0) and later.

The `cancel` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>sid</code>	number	—	Yes	The session identifier.
<code>serial</code>	number	—	Yes	The serial number of the session.
<code>sql_id</code>	varchar2	null	No	The SQL identifier of the SQL statement.

The following example cancels a SQL statement in a session.

```
begin
 rdsadmin.rdsadmin_util.cancel(
 sid => sid,
 serial => serial_number,
 sql_id => sql_id);
end;
/
```

To get the session identifier, the session serial number, and the SQL identifier of a SQL statement, query the `V$SESSION` view. The following example gets all sessions and SQL identifiers for the user `AWSUSER`.

```
select SID, SERIAL#, SQL_ID, STATUS from V$SESSION where USERNAME = 'AWSUSER';
```

## Enabling and disabling restricted sessions

To enable and disable restricted sessions, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.restricted_session`. The `restricted_session` procedure has the following parameters.

Parameter name	Data type	Default	Yes	Description
<code>p_enable</code>	boolean	true	No	Set to <code>true</code> to enable restricted sessions, <code>false</code> to disable restricted sessions.

The following example shows how to enable and disable restricted sessions.

```
/* Verify that the database is currently unrestricted. */
```

```
SELECT LOGINS FROM V$INSTANCE;

LOGINS

ALLOWED

/* Enable restricted sessions */

exec rdsadmin.rdsadmin_util.restricted_session(p_enable => true);

/* Verify that the database is now restricted. */

SELECT LOGINS FROM V$INSTANCE;

LOGINS

RESTRICTED

/* Disable restricted sessions */

exec rdsadmin.rdsadmin_util.restricted_session(p_enable => false);

/* Verify that the database is now unrestricted again. */

SELECT LOGINS FROM V$INSTANCE;

LOGINS

ALLOWED
```

## Flushing the shared pool

To flush the shared pool, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.flush_shared_pool`. The `flush_shared_pool` procedure has no parameters.

The following example flushes the shared pool.

```
exec rdsadmin.rdsadmin_util.flush_shared_pool;
```

## Flushing the buffer cache

To flush the buffer cache, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.flush_buffer_cache`. The `flush_buffer_cache` procedure has no parameters.

The following example flushes the buffer cache.

```
exec rdsadmin.rdsadmin_util.flush_buffer_cache;
```

## Granting SELECT or EXECUTE privileges to SYS objects

Usually you transfer privileges by using roles, which can contain many objects. To grant privileges to a single object, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.grant_sys_object`. The procedure grants only privileges that the master user has already been granted through a role or direct grant.

The `grant_sys_object` procedure has the following parameters.

**Important**

For all parameter values, use uppercase unless you created the user with a case-sensitive identifier. For example, if you run `CREATE USER myuser` or `CREATE USER MYUSER`, the data dictionary stores `MYUSER`. However, if you use double quotes in `CREATE USER "MyUser"`, the data dictionary stores `MyUser`.

Parameter name	Data type	Default	Required	Description
<code>p_obj_name</code>	<code>varchar2</code>	—	Yes	The name of the object to grant privileges for. The object can be a directory, function, package, procedure, sequence, table, or view. Object names must be spelled exactly as they appear in <code>DBA_OBJECTS</code> . Most system objects are defined in uppercase, so we recommend that you try that first.
<code>p_grantee</code>	<code>varchar2</code>	—	Yes	The name of the object to grant privileges to. The object can be a schema or a role.
<code>p_privilege</code>	<code>varchar2</code>	<code>null</code>	Yes	—
<code>p_grant_option</code>	<code>boolean</code>	<code>false</code>	No	Set to <code>true</code> to use the <code>WITH GRANT OPTION</code> privilege. The <code>p_grant_option</code> parameter is supported for 12.1.0.2.v4 and later, all 12.2.0.1 versions, all 18.0.0.0 versions, and all 19.0.0 versions.

The following example grants select privileges on an object named `V_$SESSION` to a user named `USER1`.

```
begin
 rdsadmin.rdsadmin_util.grant_sys_object(
 p_obj_name => 'V_$SESSION',
 p_grantee => 'USER1',
 p_privilege => 'SELECT');
end;
/
```

The following example grants select privileges on an object named `V_$SESSION` to a user named `USER1` with the grant option.

```
begin
 rdsadmin.rdsadmin_util.grant_sys_object(
 p_obj_name => 'V_$SESSION',
 p_grantee => 'USER1',
 p_privilege => 'SELECT',
 p_grant_option => true);
```

```
end;
/
```

To be able to grant privileges on an object, your account must have those privileges granted to it directly with the grant option, or via a role granted using with `admin` option. In the most common case, you may want to grant `SELECT` on a DBA view that has been granted to the `SELECT_CATALOG_ROLE` role. If that role isn't already directly granted to your user using with `admin` option, then you can't transfer the privilege. If you have the DBA privilege, then you can grant the role directly to another user.

The following example grants the `SELECT_CATALOG_ROLE` and `EXECUTE_CATALOG_ROLE` to `USER1`. Since the with `admin` option is used, `USER1` can now grant access to SYS objects that have been granted to `SELECT_CATALOG_ROLE`.

```
GRANT SELECT_CATALOG_ROLE TO USER1 WITH ADMIN OPTION;
GRANT EXECUTE_CATALOG_ROLE to USER1 WITH ADMIN OPTION;
```

Objects already granted to `PUBLIC` do not need to be re-granted. If you use the `grant_sys_object` procedure to re-grant access, the procedure call succeeds.

## Revoking SELECT or EXECUTE privileges on SYS objects

To revoke privileges on a single object, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.revoke_sys_object`. The procedure only revokes privileges that the master account has already been granted through a role or direct grant.

The `revoke_sys_object` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_obj_name</code>	varchar2	—	Yes	The name of the object to revoke privileges for. The object can be a directory, function, package, procedure, sequence, table, or view. Object names must be spelled exactly as they appear in <code>DBA_OBJECTS</code> . Most system objects are defined in upper case, so we recommend you try that first.
<code>p_revokee</code>	varchar2	—	Yes	The name of the object to revoke privileges for. The object can be a schema or a role.
<code>p_privilege</code>	varchar2	null	Yes	—

The following example revokes select privileges on an object named `V_$SESSION` from a user named `USER1`.

```
begin
 rdsadmin.rdsadmin_util.revoke_sys_object(
 p_obj_name => 'V_$SESSION',
 p_revokee => 'USER1',
 p_privilege => 'SELECT');
```

```
end;
/
```

## Granting privileges to non-master users

You can grant select privileges for many objects in the `SYS` schema by using the `SELECT_CATALOG_ROLE` role. The `SELECT_CATALOG_ROLE` role gives users `SELECT` privileges on data dictionary views. The following example grants the role `SELECT_CATALOG_ROLE` to a user named `user1`.

```
GRANT SELECT_CATALOG_ROLE TO user1;
```

You can grant `EXECUTE` privileges for many objects in the `SYS` schema by using the `EXECUTE_CATALOG_ROLE` role. The `EXECUTE_CATALOG_ROLE` role gives users `EXECUTE` privileges for packages and procedures in the data dictionary. The following example grants the role `EXECUTE_CATALOG_ROLE` to a user named `user1`.

```
GRANT EXECUTE_CATALOG_ROLE TO user1;
```

The following example gets the permissions that the roles `SELECT_CATALOG_ROLE` and `EXECUTE_CATALOG_ROLE` allow.

```
SELECT *
 FROM ROLE_TAB_PRIVS
 WHERE ROLE IN ('SELECT_CATALOG_ROLE', 'EXECUTE_CATALOG_ROLE')
ORDER BY ROLE, TABLE_NAME ASC;
```

The following example creates a non-master user named `user1`, grants the `CREATE SESSION` privilege, and grants the `SELECT` privilege on a database named `sh.sales`.

```
CREATE USER user1 IDENTIFIED BY PASSWORD;
GRANT CREATE SESSION TO user1;
GRANT SELECT ON sh.sales TO user1;
```

## Creating custom functions to verify passwords

You can create a custom password verification function in two ways. If you want to use standard verification logic, and to store your function in the `SYS` schema, use the `create_verify_function` procedure. If you want to use custom verification logic, or you don't want to store your function in the `SYS` schema, use the `create_passthrough_verify_fcn` procedure.

### The `create_verify_function` procedure

The `create_verify_function` procedure is supported for version 12.1.0.2.v5 and later of Oracle Database 12c Release 1 (12.1), all Oracle Database 12c Release 2 (12.2.0.1) versions, all Oracle Database 18c versions, and all Oracle Database 19c versions.

You can create a custom function to verify passwords by using the Amazon RDS procedure `rdsadmin.rdsadmin_password_verify.create_verify_function`. The `create_verify_function` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_verify_function_name</code>	varchar2	—	Yes	The name for your custom function. This function is

Parameter name	Data type	Default	Required	Description
				created for you in the SYS schema. You assign this function to user profiles.
p_min_length	number	8	No	The minimum number of characters required.
p_max_length	number	256	No	The maximum number of characters allowed.
p_min_letters	number	1	No	The minimum number of letters required.
p_min_uppercase	number	0	No	The minimum number of uppercase letters required.
p_min_lowercase	number	0	No	The minimum number of lowercase letters required.
p_min_digits	number	1	No	The minimum number of digits required.
p_min_special	number	0	No	The minimum number of special characters required.
p_min_different_chars	number	3	No	The minimum number of different characters required between the old and new password.
p_disallow_username	boolean	true	No	Set to true to disallow the user name in the password.
p_disallow_reverse	boolean	true	No	Set to true to disallow the reverse of the user name in the password.
p_disallow_db_name	boolean	true	No	Set to true to disallow the database or server name in the password.
p_disallow_simple_string	boolean	true	No	Set to true to disallow simple strings as the password.
p_disallow_whitespace	boolean	false	No	Set to true to disallow white space characters in the password.
p_disallow_at_sign	boolean	false	No	Set to true to disallow the @ character in the password.

You can create multiple password verification functions.

There are restrictions on the name of your custom function. Your custom function can't have the same name as an existing system object. The name can be no more than 30 characters long. Also, the name must include one of the following strings: **PASSWORD**, **VERIFY**, **COMPLEXITY**, **ENFORCE**, or **STRENGTH**.

The following example creates a function named `CUSTOM_PASSWORD_FUNCTION`. The function requires that a password has at least 12 characters, 2 uppercase characters, 1 digit, and 1 special character, and that the password disallows the @ character.

```
begin
 rdsadmin.rdsadmin_password_verify.create_verify_function(
 p_verify_function_name => 'CUSTOM_PASSWORD_FUNCTION',
 p_min_length => 12,
 p_min_uppercase => 2,
 p_min_digits => 1,
 p_min_special => 1,
 p_disallow_at_sign => true);
end;
/
```

To see the text of your verification function, query `DBA_SOURCE`. The following example gets the text of a custom password function named `CUSTOM_PASSWORD_FUNCTION`.

```
COL TEXT FORMAT a150

SELECT TEXT
 FROM DBA_SOURCE
 WHERE OWNER = 'SYS'
 AND NAME = 'CUSTOM_PASSWORD_FUNCTION'
 ORDER BY LINE;
```

To associate your verification function with a user profile, use `alter profile`. The following example associates a verification function with the `DEFAULT` user profile.

```
ALTER PROFILE DEFAULT LIMIT PASSWORD_VERIFY_FUNCTION CUSTOM_PASSWORD_FUNCTION;
```

To see what user profiles are associated with what verification functions, query `DBA_PROFILES`. The following example gets the profiles that are associated with the custom verification function named `CUSTOM_PASSWORD_FUNCTION`.

```
SELECT * FROM DBA_PROFILES WHERE RESOURCE_NAME = 'PASSWORD' AND LIMIT =
 'CUSTOM_PASSWORD_FUNCTION';

PROFILE RESOURCE_NAME RESOURCE LIMIT
----- -----
----- -----
DEFAULT PASSWORD_VERIFY_FUNCTION PASSWORD
CUSTOM_PASSWORD_FUNCTION
```

The following example gets all profiles and the password verification functions that they are associated with.

```
SELECT * FROM DBA_PROFILES WHERE RESOURCE_NAME = 'PASSWORD_VERIFY_FUNCTION';

PROFILE RESOURCE_NAME RESOURCE LIMIT
----- -----
----- -----
DEFAULT PASSWORD_VERIFY_FUNCTION PASSWORD
CUSTOM_PASSWORD_FUNCTION
RDSADMIN PASSWORD_VERIFY_FUNCTION PASSWORD NULL
```

## The create\_passthrough\_verify\_fcn procedure

The `create_passthrough_verify_fcn` procedure is supported for version 12.1.0.2.v7 and later of Oracle Database 12c Release 1 (12.1), all Oracle Database 12c Release 2 (12.2) versions, all Oracle Database 18c versions, and all Oracle Database 19c versions.

You can create a custom function to verify passwords by using the Amazon RDS procedure `rdsadmin.rdsadmin_password_verify.create_passthrough_verify_fcn`. The `create_passthrough_verify_fcn` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_verify_function_name</code>	varchar2	—	Yes	The name for your custom verification function. This is a wrapper function that is created for you in the SYS schema, and it doesn't contain any verification logic. You assign this function to user profiles.
<code>p_target_owner</code>	varchar2	—	Yes	The schema owner for your custom verification function.
<code>p_target_function_name</code>	varchar2	—	Yes	The name of your existing custom function that contains the verification logic. Your custom function must return a boolean. Your function should return <code>true</code> if the password is valid and <code>false</code> if the password is invalid.

The following example creates a password verification function that uses the logic from the function named `PASSWORD_LOGIC_EXTRA_STRONG`.

```
begin
 rdsadmin.rdsadmin_password_verify.create_passthrough_verify_fcn(
 p_verify_function_name => 'CUSTOM_PASSWORD_FUNCTION',
 p_target_owner => 'TEST_USER',
 p_target_function_name => 'PASSWORD_LOGIC_EXTRA_STRONG');
end;
/
```

To associate the verification function with a user profile, use `alter profile`. The following example associates the verification function with the `DEFAULT` user profile.

```
ALTER PROFILE DEFAULT LIMIT PASSWORD_VERIFY_FUNCTION CUSTOM_PASSWORD_FUNCTION;
```

## Setting up a custom DNS server

Amazon RDS supports outbound network access on your DB instances running Oracle. For more information about outbound network access, including prerequisites, see [Configuring outbound network access on your Oracle DB instance \(p. 1037\)](#).

Amazon RDS Oracle allows Domain Name Service (DNS) resolution from a custom DNS server owned by the customer. You can resolve only fully qualified domain names from your Amazon RDS DB instance through your custom DNS server.

After you set up your custom DNS name server, it takes up to 30 minutes to propagate the changes to your DB instance. After the changes are propagated to your DB instance, all outbound network traffic requiring a DNS lookup queries your DNS server over port 53.

To set up a custom DNS server for your Amazon RDS for Oracle DB instance, do the following:

- From the DHCP options set attached to your virtual private cloud (VPC), set the `domain-name-servers` option to the IP address of your DNS name server. For more information, see [DHCP options sets](#).

**Note**

The `domain-name-servers` option accepts up to four values, but your Amazon RDS DB instance uses only the first value.

- Ensure that your DNS server can resolve all lookup queries, including public DNS names, Amazon EC2 private DNS names, and customer-specific DNS names. If the outbound network traffic contains any DNS lookups that your DNS server can't handle, your DNS server must have appropriate upstream DNS providers configured.
- Configure your DNS server to produce User Datagram Protocol (UDP) responses of 512 bytes or less.
- Configure your DNS server to produce Transmission Control Protocol (TCP) responses of 1024 bytes or less.
- Configure your DNS server to allow inbound traffic from your Amazon RDS DB instances over port 53. If your DNS server is in an Amazon VPC, the VPC must have a security group that contains inbound rules that permit UDP and TCP traffic on port 53. If your DNS server is not in an Amazon VPC, it must have appropriate firewall allow-listing to permit UDP and TCP inbound traffic on port 53.

For more information, see [Security groups for your VPC](#) and [Adding and removing rules](#).

- Configure the VPC of your Amazon RDS DB instance to allow outbound traffic over port 53. Your VPC must have a security group that contains outbound rules that allow UDP and TCP traffic on port 53.

For more information, see [Security groups for your VPC](#) and [Adding and removing rules](#).

- The routing path between the Amazon RDS DB instance and the DNS server has to be configured correctly to allow DNS traffic.
  - If the Amazon RDS DB instance and the DNS server are not in the same VPC, a peering connection has to be set up between them. For more information, see [What is VPC peering?](#)

## Setting and unsetting system diagnostic events

To set and unset diagnostic events at the session level, you can use the Oracle SQL statement `ALTER SESSION SET EVENTS`. However, to set events at the system level you can't use Oracle SQL. Instead, use the system event procedures in the `rdsadmin.rdsadmin_util` package. The system event procedures are available in the following engine versions:

- [19.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1289\)](#) or higher 19c versions
- [18.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1327\)](#) or higher 18c versions
- [12.2.0.1.ru-2020-10.rur-2020-10.r1 \(p. 1360\)](#) or higher 12.2.0.1 versions
- [12.1.0.2.V22 \(p. 1401\)](#) or higher 12.1 versions

**Important**

Internally, the `rdsadmin.rdsadmin_util` package sets events by using the `ALTER SYSTEM SET EVENTS` statement. This `ALTER SYSTEM` statement isn't documented in the Oracle Database documentation. Some system diagnostic events can generate large amounts of

tracing information, cause contention, or affect database availability. We recommend that you test specific diagnostic events in your nonproduction database, and only set events in your production database under guidance of Oracle Support.

## Listing allowed system diagnostic events

To list the system events that you can set, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.list_allowed_system_events`. This procedure accepts no parameters.

The following example lists all system events that you can set.

```
SET SERVEROUTPUT ON
EXEC rdsadmin.rdsadmin_util.list_allowed_system_events;
```

The following sample output lists event numbers and their descriptions. Use the Amazon RDS procedures `set_system_event` to set these events and `unset_system_event` to unset them.

```
604 - error occurred at recursive SQL level
942 - table or view does not exist
1401 - inserted value too large for column
1403 - no data found
1410 - invalid ROWID
1422 - exact fetch returns more than requested number of rows
1426 - numeric overflow
1427 - single-row subquery returns more than one row
1476 - divisor is equal to zero
1483 - invalid length for DATE or NUMBER bind variable
1489 - result of string concatenation is too long
1652 - unable to extend temp segment by in tablespace
1858 - a non-numeric character was found where a numeric was expected
4031 - unable to allocate bytes of shared memory ("","","","","")
6502 - PL/SQL: numeric or value error
10027 - Specify Deadlock Trace Information to be Dumped
10046 - enable SQL statement timing
10053 - CBO Enable optimizer trace
10173 - Dynamic Sampling time-out error
10442 - enable trace of kst for ORA-01555 diagnostics
12008 - error in materialized view refresh path
12012 - error on auto execute of job
12504 - TNS:listener was not given the SERVICE_NAME in CONNECT_DATA
14400 - inserted partition key does not map to any partition
31693 - Table data object failed to load/unload and is being skipped due to error:
```

### Note

The list of the allowed system events can change over time. To make sure that you have the most recent list of eligible events, use `rdsadmin.rdsadmin_util.list_allowed_system_events`.

## Setting system diagnostic events

To set a system event, use the Amazon RDS procedure

`rdsadmin.rdsadmin_util.set_system_event`. You can only set events listed in the output of `rdsadmin.rdsadmin_util.list_allowed_system_events`. The `set_system_event` procedure accepts the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_event</code>	number	—	Yes	The system event number. The value must

Parameter name	Data type	Default	Required	Description
				be one of the event numbers reported by <code>list_allowed_system_events</code> .
<code>p_level</code>	number	—	Yes	The event level. See the Oracle Database documentation or Oracle Support for descriptions of different level values.

The procedure `set_system_event` constructs and runs the required `ALTER SYSTEM SET EVENTS` statements according to the following principles:

- The event type (`context` or `errorstack`) is determined automatically.
- A statement in the form `ALTER SYSTEM SET EVENTS 'event LEVEL event_level'` sets the context events. This notation is equivalent to `ALTER SYSTEM SET EVENTS 'event TRACE NAME CONTEXT FOREVER, LEVEL event_level'`.
- A statement in the form `ALTER SYSTEM SET EVENTS 'event ERRORSTACK (event_level)'` sets the error stack events. This notation is equivalent to `ALTER SYSTEM SET EVENTS 'event TRACE NAME ERRORSTACK LEVEL event_level'`.

The following example sets event 942 at level 3, and event 10442 at level 10. Sample output is included.

```
SQL> SET SERVEROUTPUT ON
SQL> EXEC rdsadmin.rdsadmin_util.set_system_event(942,3);
Setting system event 942 with: alter system set events '942 errorstack (3)'

PL/SQL procedure successfully completed.

SQL> EXEC rdsadmin.rdsadmin_util.set_system_event(10442,10);
Setting system event 10442 with: alter system set events '10442 level 10'

PL/SQL procedure successfully completed.
```

## Listing system diagnostic events that are set

To list the system events that are currently set, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.list_set_system_events`. This procedure reports only events set at system level by `set_system_event`.

The following example lists the active system events.

```
SET SERVEROUTPUT ON
EXEC rdsadmin.rdsadmin_util.list_set_system_events;
```

The following sample output shows the list of events, the event type, the level at which the events are currently set, and the time when the event was set.

```
942 errorstack (3) - set at 2020-11-03 11:42:27
10442 level 10 - set at 2020-11-03 11:42:41

PL/SQL procedure successfully completed.
```

## Unsetting system diagnostic events

To unset a system event, use the Amazon RDS procedure

`rdsadmin.rdsadmin_util.unset_system_event`. You can only unset events listed in the output of `rdsadmin.rdsadmin_util.list_allowed_system_events`. The `unset_system_event` procedure accepts the following parameter.

Parameter name	Data type	Default	Required	Description
<code>p_event</code>	number	—	Yes	The system event number. The value must be one of the event numbers reported by <code>list_allowed_system_events</code> .

The following example unsets events 942 and 10442. Sample output is included.

```
SQL> SET SERVEROUTPUT ON
SQL> EXEC rdsadmin.rdsadmin_util.unset_system_event(942);
Unsetting system event 942 with: alter system set events '942 off'

PL/SQL procedure successfully completed.

SQL> EXEC rdsadmin.rdsadmin_util.unset_system_event(10442);
Unsetting system event 10442 with: alter system set events '10442 off'

PL/SQL procedure successfully completed.
```

## Performing common database tasks for Oracle DB instances

Following, you can find how to perform certain common DBA tasks related to databases on your Amazon RDS DB instances running Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances. Amazon RDS also restricts access to some system procedures and tables that require advanced privileges.

### Topics

## Changing the global name of a database

To change the global name of a database, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.rename_global_name`. The `rename_global_name` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_new_global_name</code>	varchar2	—	Yes	The new global name for the database.

The database must be open for the name change to occur. For more information about changing the global name of a database, see [ALTER DATABASE](#) in the Oracle documentation.

The following example changes the global name of a database to `new_global_name`.

```
exec rdsadmin.rdsadmin_util.rename_global_name(p_new_global_name => 'new_global_name');
```

## Creating and sizing tablespaces

Amazon RDS only supports Oracle Managed Files (OMF) for data files, log files, and control files. When you create data files and log files, you can't specify the physical file names.

By default, tablespaces are created with auto-extend enabled, and no maximum size. Because of these default settings, tablespaces can grow to consume all allocated storage. We recommend that you specify an appropriate maximum size on permanent and temporary tablespaces, and that you carefully monitor space usage.

The following example creates a tablespace named `users2` with a starting size of 1 gigabyte and a maximum size of 10 gigabytes:

```
CREATE TABLESPACE users2 DATAFILE SIZE 1G AUTOEXTEND ON MAXSIZE 10G;
```

The following example creates temporary tablespace named `temp01`:

```
CREATE TEMPORARY TABLESPACE temp01;
```

We recommend that you don't use smallfile tablespaces because you can't resize smallfile tablespaces with Amazon RDS for Oracle. However, you can add a datafile to a smallfile tablespace.

You can resize a bigfile tablespace by using `ALTER TABLESPACE`. You can specify the size in kilobytes (K), megabytes (M), gigabytes (G), or terabytes (T).

The following example resizes a bigfile tablespace named `users2` to 200 MB.

```
ALTER TABLESPACE users2 RESIZE 200M;
```

The following example adds an additional datafile to a smallfile tablespace named `users2`.

```
ALTER TABLESPACE users2 ADD DATAFILE SIZE 100000M AUTOEXTEND ON NEXT 250m
MAXSIZE UNLIMITED;
```

## Setting the default tablespace

To set the default tablespace, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.alter_default_tablespace`. The `alter_default_tablespace` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>tablespace_name</code>	varchar	—	Yes	The name of the default tablespace.

The following example sets the default tablespace to `users2`:

```
EXEC rdsadmin.rdsadmin_util.alter_default_tablespace(tablespace_name => 'users2');
```

## Setting the default temporary tablespace

To set the default temporary tablespace, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.alter_default_temp_tablespace`. The `alter_default_temp_tablespace` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>tablespace_name</code>	varchar	—	Yes	The name of the default temporary tablespace.

The following example sets the default temporary tablespace to `temp01`.

```
EXEC rdsadmin.rdsadmin_util.alter_default_temp_tablespace(tablespace_name => 'temp01');
```

## Checkpointing a database

To checkpoint the database, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.checkpoint`. The `checkpoint` procedure has no parameters.

The following example checkpoints the database.

```
EXEC rdsadmin.rdsadmin_util.checkpoint;
```

## Setting distributed recovery

To set distributed recovery, use the Amazon RDS procedures `rdsadmin.rdsadmin_util.enable_distr_recovery` and `disable_distr_recovery`. The procedures have no parameters.

The following example enables distributed recovery.

```
EXEC rdsadmin.rdsadmin_util.enable_distr_recovery;
```

The following example disables distributed recovery.

```
EXEC rdsadmin.rdsadmin_util.disable_distr_recovery;
```

## Setting the database time zone

You can set the time zone of your Amazon RDS Oracle database in the following ways:

- The `Timezone` option

The `Timezone` option changes the time zone at the host level and affects all date columns and values such as `SYSDATE`. For more information, see [Oracle time zone \(p. 1213\)](#).

- The Amazon RDS procedure `rdsadmin.rdsadmin_util.alter_db_time_zone`

The `alter_db_time_zone` procedure changes the time zone for only certain data types, and doesn't change `SYSDATE`. There are additional restrictions on setting the time zone listed in the [Oracle documentation](#).

### Note

You can also set the default time zone for Oracle Scheduler. For more information, see [Setting the time zone for Oracle Scheduler jobs \(p. 1099\)](#).

The `alter_db_time_zone` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_new_tz</code>	<code>varchar2</code>	—	Yes	The new time zone as a named region or an absolute offset from Coordinated Universal Time (UTC). Valid offsets range from -12:00 to +14:00.

The following example changes the time zone to UTC plus three hours.

```
EXEC rdsadmin.rdsadmin_util.alter_db_time_zone(p_new_tz => '+3:00');
```

The following example changes the time zone to the Africa/Algiers time zone.

```
EXEC rdsadmin.rdsadmin_util.alter_db_time_zone(p_new_tz => 'Africa/Algiers');
```

After you alter the time zone by using the `alter_db_time_zone` procedure, reboot your DB instance for the change to take effect. For more information, see [Rebooting a DB instance \(p. 277\)](#). For information about upgrading time zones, see [Time zone considerations \(p. 1225\)](#).

## Working with Oracle external tables

*Oracle external tables* are tables with data that is not in the database. Instead, the data is in external files that the database can access. By using external tables, you can access data without loading it into the database. For more information about external tables, see [Managing external tables](#) in the Oracle documentation.

With Amazon RDS, you can store external table files in directory objects. You can create a directory object, or you can use one that is predefined in the Oracle database, such as the DATA\_PUMP\_DIR directory. For information about creating directory objects, see [Creating and dropping directories in the main data storage space \(p. 1108\)](#). You can query the ALL\_DIRECTORIES view to list the directory objects for your Amazon RDS Oracle DB instance.

**Note**

Directory objects point to the main data storage space (Amazon EBS volume) used by your instance. The space used—along with data files, redo logs, audit, trace, and other files—counts against allocated storage.

You can move an external data file from one Oracle database to another by using the [DBMS\\_FILE\\_TRANSFER](#) package or the [UTL\\_FILE](#) package. The external data file is moved from a directory on the source database to the specified directory on the destination database. For information about using DBMS\_FILE\_TRANSFER, see [Importing using Oracle Data Pump \(p. 1118\)](#).

After you move the external data file, you can create an external table with it. The following example creates an external table that uses the `emp_xt_file1.txt` file in the `USER_DIR1` directory.

```
CREATE TABLE emp_xt (
 emp_id NUMBER,
 first_name VARCHAR2(50),
 last_name VARCHAR2(50),
 user_name VARCHAR2(20)
)
ORGANIZATION EXTERNAL (
 TYPE ORACLE_LOADER
 DEFAULT DIRECTORY USER_DIR1
 ACCESS PARAMETERS (
 RECORDS DELIMITED BY NEWLINE
 FIELDS TERMINATED BY ','
 MISSING FIELD VALUES ARE NULL
 (emp_id,first_name,last_name,user_name)
)
 LOCATION ('emp_xt_file1.txt')
)
PARALLEL
REJECT LIMIT UNLIMITED;
```

Suppose that you want to move data that is in an Amazon RDS Oracle DB instance into an external data file. In this case, you can populate the external data file by creating an external table and selecting the data from the table in the database. For example, the following SQL statement creates the `orders_xt` external table by querying the `orders` table in the database.

```
CREATE TABLE orders_xt
ORGANIZATION EXTERNAL
(
 TYPE ORACLE_DATAPUMP
 DEFAULT DIRECTORY DATA_PUMP_DIR
 LOCATION ('orders_xt.dmp')
)
AS SELECT * FROM orders;
```

In this example, the data is populated in the `orders_xt.dmp` file in the `DATA_PUMP_DIR` directory.

## Generating performance reports with Automatic Workload Repository (AWR)

To gather performance data and generate reports, Oracle recommends Automatic Workload Repository (AWR). AWR requires Oracle Database Enterprise Edition and a license for the Diagnostics and Tuning

packs. To enable AWR, set the `CONTROL_MANAGEMENT_PACK_ACCESS` initialization parameter to either `DIAGNOSTIC` or `DIAGNOSTIC+TUNING`.

## Working with AWR reports in RDS

To generate AWR reports, you can run scripts such as `awrrpt.sql`. These scripts are installed on the database host server. In Amazon RDS, you don't have direct access to the host. However, you can get copies of SQL scripts from another installation of Oracle Database.

You can also use AWR by running procedures in the `SYS.DBMS_WORKLOAD_REPOSITORY` PL/SQL package. You can use this package to manage baselines and snapshots, and also to display ASH and AWR reports. For example, to generate an AWR report in text format run the `DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT` procedure. However, you can't reach these AWR reports from the AWS Management Console.

When working with AWR, we recommend using the `rdsadmin.rdsadmin_diagnostic_util` procedures. You can use these procedures to generate the following:

- AWR reports
- Active Session History (ASH) reports
- Automatic Database Diagnostic Monitor (ADDM) reports
- Oracle Data Pump Export dump files of AWR data

The `rdsadmin_diagnostic_util` procedures save the reports to the DB instance file system. You can access these reports from the console. You can also access reports using the `rdsadmin.rds_file_util` procedures, and you can access reports that are copied to Amazon S3 using the S3 Integration option. For more information, see [Reading files in a DB instance directory \(p. 1109\)](#) and [Amazon S3 integration \(p. 1139\)](#).

You can use the `rdsadmin_diagnostic_util` procedures in the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v20 or higher 12.1 versions
- 12.2.0.1.ru-2020-04.rur-2020-04.r1 or higher 12.2 versions
- 18.0.0.0.ru-2020-04.rur-2020-04.r1 or higher 18c versions
- 19.0.0.0.ru-2020-04.rur-2020-04.r1 or higher 19c versions

## Common parameters for the diagnostic utility package

You typically use the following parameters when managing AWR and ADDM with the `rdsadmin_diagnostic_util` package.

Parameter	Data type	Default	Requir	Description
<code>begin_snap_id</code>	NUMBER	—	Yes	The ID of the beginning snapshot.
<code>end_snap_id</code>	NUMBER	—	Yes	The ID of the ending snapshot.
<code>dump_directory</code>	VARCHAR	BDUMP	No	The directory to write the report or export file to. If you specify a nondefault directory, the user that runs the <code>rdsadmin_diagnostic_util</code> procedures must have write permissions for the directory.

Parameter	Data type	Default	Requires	Description
report_type	VARCHAR2	HTML	No	The format of the report. Valid values are TEXT and HTML.
dbid	NUMBER	—	No	A valid database identifier (DBID) shown in the DBA_HIST_DATABASE_INSTANCE view for Oracle. If this parameter is not specified, RDS uses the current DBID, which is shown in the V\$DATABASE.DBID view.

You typically use the following parameters when managing ASH with the rdsadmin\_diagnostic\_util package.

Parameter	Data type	Default	Requires	Description
begin_time	DATE	—	Yes	The beginning time of the ASH analysis.
end_time	DATE	—	Yes	The ending time of the ASH analysis.
slot_width	NUMBER	0	No	The duration of the slots (in seconds) used in the "Top Activity" section of the ASH report. If this parameter isn't specified, the time interval between begin_time and end_time uses no more than 10 slots.
sid	NUMBER	Null	No	The session ID.
sql_id	VARCHAR2	Null	No	The SQL ID.
wait_class	VARCHAR2	Null	No	The wait class name.
service_hash	NUMBER	Null	No	The service name hash.
module_name	VARCHAR2	Null	No	The module name.
action_name	VARCHAR2	Null	No	The action name.
client_id	VARCHAR2	Null	No	The application-specific ID of the database session.
plsql_entry	VARCHAR2	Null	No	The PL/SQL entry point.

## Generating an AWR report

To generate an AWR report, use the `rdsadmin.rdsadmin_diagnostic_util.awr_report` procedure.

The following example generates a AWR report for the snapshot range 101–106. The output text file is named `awrrpt_101_106.txt`. You can access this report from the AWS Management Console.

```
exec rdsadmin.rdsadmin_diagnostic_util.awr_report(101,106,'TEXT');
```

The following example generates an HTML report for the snapshot range 63–65. The output HTML file is named `awrrpt_63_65.html`. The procedure writes the report to the nondefault database directory named `AWR_RPT_DUMP`.

```
exec rdsadmin.rdsadmin_diagnostic_util.awr_report(63,65,'HTML','AWR_RPT_DUMP');
```

## Extracting AWR data into a dump file

To extract AWR data into a dump file, use the `rdsadmin.rdsadmin_diagnostic_util.awr_extract` procedure.

The following example extracts the snapshot range 101–106. The output dump file is named `awrextract_101_106.dmp`. You can access this file through the console.

```
exec rdsadmin.rdsadmin_diagnostic_util.awr_extract(101,106);
```

The following example extracts the snapshot range 63–65. The output dump file is named `awrextract_63_65.dmp`. The file is stored in the nondefault database directory named `AWR_RPT_DUMP`.

```
exec rdsadmin.rdsadmin_diagnostic_util.awr_extract(63,65, 'AWR_RPT_DUMP');
```

## Generating an ADDM report

To generate an ADDM report, use the `rdsadmin.rdsadmin_diagnostic_util.addm_report` procedure.

The following example generates an ADDM report for the snapshot range 101–106. The output text file is named `addmrpt_101_106.txt`. You can access the report through the console.

```
exec rdsadmin.rdsadmin_diagnostic_util.addm_report(101,106);
```

The following example generates an ADDM report for the snapshot range 63–65. The output text file is named `addmrpt_63_65.txt`. The file is stored in the nondefault database directory named `ADDM_RPT_DUMP`.

```
exec rdsadmin.rdsadmin_diagnostic_util.addm_report(63,65, 'ADDM_RPT_DUMP');
```

## Generating an ASH report

To generate an ASH report, use the `rdsadmin.rdsadmin_diagnostic_util.ash_report` procedure.

The following example generates an ASH report that includes the data from 14 minutes ago until the current time. The name of the output file uses the format `ashrptbegin_timeend_time`.txt, where `begin_time` and `end_time` use the format `YYYYMMDDHH24MISS`. You can access the file through the console.

```
BEGIN
 rdsadmin.rdsadmin_diagnostic_util.ash_report(
 begin_time => SYSDATE-14/1440,
 end_time => SYSDATE,
 report_type => 'TEXT');
END;
/
```

The following example generates an ASH report that includes the data from November 18, 2019, at 6:07 PM through November 18, 2019, at 6:15 PM. The name of the output HTML report is `ashrpt_20190918180700_20190918181500.html`. The report is stored in the nondefault database directory named `AWR_RPT_DUMP`.

```
BEGIN
 rdsadmin.rdsadmin_diagnostic_util.ash_report(
 begin_time => TO_DATE('2019-09-18 18:07:00', 'YYYY-MM-DD HH24:MI:SS'),
```

```
 end_time => TO_DATE('2019-09-18 18:15:00', 'YYYY-MM-DD HH24:MI:SS'),
 report_type => 'html',
 dump_directory => 'AWR_RPT_DUMP');
END;
/
```

## Accessing AWR reports from the console or CLI

To access AWR reports or export dump files, you can use the AWS Management Console or AWS CLI. For more information, see [Downloading a database log file \(p. 525\)](#).

## Adjusting database links for use with DB instances in a VPC

To use Oracle database links with Amazon RDS DB instances inside the same virtual private cloud (VPC) or peered VPCs, the two DB instances should have a valid route between them. Verify the valid route between the DB instances by using your VPC routing tables and network access control list (ACL).

The security group of each DB instance must allow ingress to and egress from the other DB instance. The inbound and outbound rules can refer to security groups from the same VPC or a peered VPC. For more information, see [Updating your security groups to reference peered VPC security groups](#).

If you have configured a custom DNS server using the DHCP Option Sets in your VPC, your custom DNS server must be able to resolve the name of the database link target. For more information, see [Setting up a custom DNS server \(p. 1057\)](#).

For more information about using database links with Oracle Data Pump, see [Importing using Oracle Data Pump \(p. 1118\)](#).

## Setting the default edition for a DB instance

You can redefine database objects in a private environment called an edition. You can use edition-based redefinition to upgrade an application's database objects with minimal downtime.

You can set the default edition of an Amazon RDS Oracle DB instance using the Amazon RDS procedure `rdsadmin.rdsadmin_util.alter_default_edition`.

The following example sets the default edition for the Amazon RDS Oracle DB instance to `RELEASE_V1`.

```
exec rdsadmin.rdsadmin_util.alter_default_edition('RELEASE_V1');
```

The following example sets the default edition for the Amazon RDS Oracle DB instance back to the Oracle default.

```
exec rdsadmin.rdsadmin_util.alter_default_edition('ORA$BASE');
```

For more information about Oracle edition-based redefinition, see [About editions and edition-based redefinition](#) in the Oracle documentation.

## Enabling auditing for the SYS.AUD\$ table

To enable auditing on the database audit trail table `SYS.AUD$`, use the Amazon RDS procedure `rdsadmin.rdsadmin_master_util.audit_all_sys_aud_table`. The only supported audit property is `ALL`. You can't audit or not audit individual statements or operations.

Enabling auditing is supported for Oracle DB instances running the following versions:

- 12.1.0.2.v14 and later 12.1 versions
- All 12.2.0.1 versions

- All 18.0.0.0 versions
- All 19.0.0.0 versions

The `audit_all_sys_aud_table` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_by_access</code>	boolean	true	No	Set to <code>true</code> to audit <code>BY ACCESS</code> . Set to <code>false</code> to audit <code>BY SESSION</code> .

**Note**

In a single-tenant CDB, the following operations work, but no customer-visible mechanism can detect the current status of the operations. Auditing information isn't available from within the PDB. For more information, see [Limitations of a single-tenant CDB \(p. 1012\)](#).

The following query returns the current audit configuration for `SYS.AUD$` for a database.

```
SELECT * FROM DBA_OBJ_AUDIT_OPTS WHERE OWNER='SYS' AND OBJECT_NAME='AUD$';
```

The following commands enable audit of `ALL` on `SYS.AUD$` `BY ACCESS`.

```
exec rdsadmin.rdsadmin_master_util.audit_all_sys_aud_table;
exec rdsadmin.rdsadmin_master_util.audit_all_sys_aud_table(p_by_access => true);
```

The following command enables audit of `ALL` on `SYS.AUD$` `BY SESSION`.

```
exec rdsadmin.rdsadmin_master_util.audit_all_sys_aud_table(p_by_access => false);
```

For more information, see [AUDIT \(traditional auditing\)](#) in the Oracle documentation.

## Disabling auditing for the `SYS.AUD$` table

To disable auditing on the database audit trail table `SYS.AUD$`, use the Amazon RDS procedure `rdsadmin.rdsadmin_master_util.noaudit_all_sys_aud_table`. This procedure takes no parameters.

The following query returns the current audit configuration for `SYS.AUD$` for a database:

```
SELECT * FROM DBA_OBJ_AUDIT_OPTS WHERE OWNER='SYS' AND OBJECT_NAME='AUD$';
```

The following command disables audit of `ALL` on `SYS.AUD$`.

```
exec rdsadmin.rdsadmin_master_util.noaudit_all_sys_aud_table;
```

For more information, see [NOAUDIT \(traditional auditing\)](#) in the Oracle documentation.

## Cleaning up interrupted online index builds

To clean up failed online index builds, use the Amazon RDS procedure `rdsadmin.rdsadmin_dbms_repair.online_index_clean`.

The `online_index_clean` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
object_id	binary_integer	ALL_INDEX_ID	No	The object ID of the index. Typically, you can use the object ID from the ORA-08104 error text.
wait_for_lock	binary_integer	rdsadmin.rdsadmin_dbms_repair.lock_nowait	No	<p>Specify <code>r.r.lock_wait</code> or <code>rdsadmin.rdsadmin_dbms_repair.lock_nowait</code> as the default, to try to get a lock on the underlying object and retry until an internal limit is reached if the lock fails.</p> <p>Specify <code>rdsadmin.rdsadmin_dbms_repair.lock_nowait</code> to try to get a lock on the underlying object but not retry if the lock fails.</p>

The following example cleans up a failed online index build:

```

declare
 is_clean boolean;
begin
 is_clean := rdsadmin.rdsadmin_dbms_repair.online_index_clean(
 object_id => 1234567890,
 wait_for_lock => rdsadmin.rdsadmin_dbms_repair.lock_nowait
);
end;
/

```

For more information, see [ONLINE\\_INDEX\\_CLEAN function](#) in the Oracle documentation.

## Skipping corrupt blocks

To skip corrupt blocks during index and table scans, use the `rdsadmin.rdsadmin_dbms_repair` package.

The following procedures wrap the functionality of the `sys.dbms_repair.admin_table` procedure and take no parameters:

- `rdsadmin.rdsadmin_dbms_repair.create_repair_table`
- `rdsadmin.rdsadmin_dbms_repair.create_orphan_keys_table`
- `rdsadmin.rdsadmin_dbms_repair.drop_repair_table`
- `rdsadmin.rdsadmin_dbms_repair.drop_orphan_keys_table`
- `rdsadmin.rdsadmin_dbms_repair.purge_repair_table`
- `rdsadmin.rdsadmin_dbms_repair.purge_orphan_keys_table`

The following procedures take the same parameters as their counterparts in the `DBMS_REPAIR` package for Oracle databases:

- `rdsadmin.rdsadmin_dbms_repair.check_object`

- `rdsadmin.rdsadmin_dbms_repair.dump_orphan_keys`
- `rdsadmin.rdsadmin_dbms_repair.fix_corrupt_blocks`
- `rdsadmin.rdsadmin_dbms_repair.rebuild_freelists`
- `rdsadmin.rdsadmin_dbms_repair.segment_fix_status`
- `rdsadmin.rdsadmin_dbms_repair.skip_corrupt_blocks`

For more information about handling database corruption, see [DBMS\\_REPAIR](#) in the Oracle documentation.

### Example Responding to corrupt blocks

This example shows the basic workflow for responding to corrupt blocks. Your steps will depend on the location and nature of your block corruption.

#### Important

Before attempting to repair corrupt blocks, review the [DBMS\\_REPAIR](#) documentation carefully.

### To skip corrupt blocks during index and table scans

1. Run the following procedures to create repair tables if they don't already exist.

```
exec rdsadmin.rdsadmin_dbms_repair.create_repair_table;
exec rdsadmin.rdsadmin_dbms_repair.create_orphan_keys_table;
```

2. Run the following procedures to check for existing records and purge them if appropriate.

```
SELECT COUNT(*) FROM SYS.REPAIR_TABLE;
SELECT COUNT(*) FROM SYS.ORPHAN_KEY_TABLE;
SELECT COUNT(*) FROM SYS.DBA_REPAIR_TABLE;
SELECT COUNT(*) FROM SYS.DBA_ORPHAN_KEY_TABLE;

exec rdsadmin.rdsadmin_dbms_repair.purge_repair_table;
exec rdsadmin.rdsadmin_dbms_repair.purge_orphan_keys_table;
```

3. Run the following procedure to check for corrupt blocks.

```
SET SERVEROUTPUT ON
DECLARE v_num_corrupt INT;
BEGIN
 v_num_corrupt := 0;
 rdsadmin.rdsadmin_dbms_repair.check_object (
 schema_name => '&corruptionOwner',
 object_name => '&corruptionTable',
 corrupt_count => v_num_corrupt
);
 dbms_output.put_line('number corrupt: '||to_char(v_num_corrupt));
END;
/

COL CORRUPT_DESCRIPTION FORMAT a30
COL REPAIR_DESCRIPTION FORMAT a30

SELECT OBJECT_NAME, BLOCK_ID, CORRUPT_TYPE, MARKED_CORRUPT,
 CORRUPT_DESCRIPTION, REPAIR_DESCRIPTION
 FROM SYS.REPAIR_TABLE;

SELECT SKIP_CORRUPT
 FROM DBA_TABLES
 WHERE OWNER = '&corruptionOwner'
 AND TABLE_NAME = '&corruptionTable';
```

4. Use the `skip_corrupt_blocks` procedure to enable or disable corruption skipping for affected tables. Depending on the situation, you may also need to extract data to a new table, and then drop the table containing the corrupt block.

Run the following procedure to enable corruption skipping for affected tables.

```
begin
 rdsadmin.rdsadmin_dbms_repair.skip_corrupt_blocks (
 schema_name => '&corruptionOwner',
 object_name => '&corruptionTable',
 object_type => rdsadmin.rdsadmin_dbms_repair.table_object,
 flags => rdsadmin.rdsadmin_dbms_repair.skip_flag);
end;
/
select skip_corrupt from dba_tables where owner = '&corruptionOwner' and table_name =
 '&corruptionTable';
```

Run the following procedure to disable corruption skipping.

```
begin
 rdsadmin.rdsadmin_dbms_repair.skip_corrupt_blocks (
 schema_name => '&corruptionOwner',
 object_name => '&corruptionTable',
 object_type => rdsadmin.rdsadmin_dbms_repair.table_object,
 flags => rdsadmin.rdsadmin_dbms_repair.noskip_flag);
end;
/
select skip_corrupt from dba_tables where owner = '&corruptionOwner' and table_name =
 '&corruptionTable';
```

5. When you have completed all repair work, run the following procedures to drop the repair tables.

```
exec rdsadmin.rdsadmin_dbms_repair.drop_repair_table;
exec rdsadmin.rdsadmin_dbms_repair.drop_orphan_keys_table;
```

## Resizing the temporary tablespace in a read replica

By default, Oracle tablespaces are created with auto-extend enabled and no maximum size. Because of these default settings, tablespaces can grow too large in some cases. We recommend that you specify an appropriate maximum size on permanent and temporary tablespaces, and that you carefully monitor space usage.

To resize the temporary space in a read replica for an Oracle DB instance, use either the `rdsadmin.rdsadmin_util.resize_temp_tablespace` or the `rdsadmin.rdsadmin_util.resize_tempfile` Amazon RDS procedure.

The `resize_temp_tablespace` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>temp_tbs</code>	varchar2	—	Yes	The name of the temporary tablespace to resize.
<code>size</code>	varchar2	—	Yes	You can specify the size in bytes (the default), kilobytes (K), megabytes (M), or gigabytes (G).

The `resize_tempfile` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>file_id</code>	<code>binary_integer</code>	—	Yes	The file identifier of the temporary tablespace to resize.
<code>size</code>	<code>varchar2</code>	—	Yes	You can specify the size in bytes (the default), kilobytes (K), megabytes (M), or gigabytes (G).

The following examples resize a temporary tablespace named `TEMP` to the size of 4 gigabytes on a read replica.

```
exec rdsadmin.rdsadmin_util.resize_temp_tablespace('TEMP', '4G');
```

```
exec rdsadmin.rdsadmin_util.resize_temp_tablespace('TEMP', '4096000000');
```

The following example resizes a temporary tablespace based on the tempfile with the file identifier 1 to the size of 2 megabytes on a read replica.

```
exec rdsadmin.rdsadmin_util.resize_tempfile(1, '2M');
```

For more information about read replicas for Oracle DB instances, see [Working with Oracle replicas for Amazon RDS \(p. 1131\)](#).

## Purging the recycle bin

When you drop a table, your Oracle database doesn't immediately remove its storage space. The database renames the table and places it and any associated objects in a recycle bin. Purging the recycle bin removes these items and releases their storage space.

To purge the entire recycle bin, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.purge_dba_recyclebin`. However, this procedure can't purge the recycle bin of `SYS` and `RDSADMIN` objects. If you need to purge these objects, contact AWS Support.

The following example purges the entire recycle bin.

```
exec rdsadmin.rdsadmin_util.purge_dba_recyclebin;
```

## Performing common log-related tasks for Oracle DB instances

Following, you can find how to perform certain common DBA tasks related to logging on your Amazon RDS DB instances running Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances, and restricts access to certain system procedures and tables that require advanced privileges.

For more information, see [Oracle database log files \(p. 550\)](#).

### Topics

- [Setting force logging \(p. 1075\)](#)
- [Setting supplemental logging \(p. 1075\)](#)
- [Switching online log files \(p. 1076\)](#)

- [Retaining archived redo logs \(p. 1079\)](#)
- [Accessing transaction logs \(p. 1080\)](#)

## Setting force logging

In force logging mode, Oracle logs all changes to the database except changes in temporary tablespaces and temporary segments (NOLOGGING clauses are ignored). For more information, see [Specifying FORCE LOGGING mode](#) in the Oracle documentation.

To set force logging, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.force_logging`. The `force_logging` procedure has the following parameters.

Parameter name	Data type	Default	Yes	Description
<code>p_enable</code>	boolean	true	No	Set to <code>true</code> to put the database in force logging mode, <code>false</code> to remove the database from force logging mode.

The following example puts the database in force logging mode.

```
exec rdsadmin.rdsadmin_util.force_logging(p_enable => true);
```

## Setting supplemental logging

If you enable supplemental logging, LogMiner has the necessary information to support chained rows and clustered tables. For more information, see [Supplemental logging](#) in the Oracle documentation.

Oracle Database doesn't enable supplemental logging by default. To enable and disable supplemental logging, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.alter_supplemental_logging`. For more information about how Amazon RDS manages the retention of archived redo logs for Oracle DB instances, see [Retaining archived redo logs \(p. 1079\)](#).

The `alter_supplemental_logging` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_action</code>	varchar2	—	Yes	'ADD' to add supplemental logging, 'DROP' to drop supplemental logging.
<code>p_type</code>	varchar2	null	No	The type of supplemental logging. Valid values are 'ALL', 'FOREIGN'

Parameter name	Data type	Default	Required	Description
				KEY', 'PRIMARY KEY', 'UNIQUE', or PROCEDURAL.

The following example enables supplemental logging.

```
begin
 rdsadmin.rdsadmin_util.alter_supplemental_logging(
 p_action => 'ADD');
end;
/
```

The following example enables supplemental logging for all fixed-length maximum size columns.

```
begin
 rdsadmin.rdsadmin_util.alter_supplemental_logging(
 p_action => 'ADD',
 p_type => 'ALL');
end;
/
```

The following example enables supplemental logging for primary key columns.

```
begin
 rdsadmin.rdsadmin_util.alter_supplemental_logging(
 p_action => 'ADD',
 p_type => 'PRIMARY KEY');
end;
/
```

## Switching online log files

To switch log files, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.switch_logfile`. The `switch_logfile` procedure has no parameters.

The following example switches log files.

```
exec rdsadmin.rdsadmin_util.switch_logfile;
```

## Adding online redo logs

An Amazon RDS DB instance running Oracle starts with four online redo logs, 128 MB each. To add additional redo logs, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.add_logfile`.

The `add_logfile` procedure has the following parameters.

### Note

The parameters are mutually exclusive.

Parameter name	Data type	Default	Required	Description
bytes	positive	null	No	The size of the log file in bytes.

Parameter name	Data type	Default	Required	Description
p_size	varchar2	—	Yes	The size of the log file. You can specify the size in kilobytes (K), megabytes (M), or gigabytes (G).

The following command adds a 100 MB log file.

```
exec rdsadmin.rdsadmin_util.add_logfile(p_size => '100M');
```

## Dropping online redo logs

To drop redo logs, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.drop_logfile`. The `drop_logfile` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
grp	positive	—	Yes	The group number of the log.

The following example drops the log with group number 3.

```
exec rdsadmin.rdsadmin_util.drop_logfile(grp => 3);
```

You can only drop logs that have a status of unused or inactive. The following example gets the statuses of the logs.

```
SELECT GROUP#, STATUS FROM V$LOG;
GROUP# STATUS
----- -----
1 CURRENT
2 INACTIVE
3 INACTIVE
4 UNUSED
```

## Resizing online redo logs

An Amazon RDS DB instance running Oracle starts with four online redo logs, 128 MB each. The following example shows how you can use Amazon RDS procedures to resize your logs from 128 MB each to 512 MB each.

```
/* Query V$LOG to see the logs. */
/* You start with 4 logs of 128 MB each. */

SELECT GROUP#, BYTES, STATUS FROM V$LOG;
GROUP# BYTES STATUS
----- -----
1 134217728 INACTIVE
2 134217728 CURRENT
3 134217728 INACTIVE
4 134217728 INACTIVE
```

```

/* Add four new logs that are each 512 MB */

exec rdsadmin.rdsadmin_util.add_logfile(bytes => 536870912);
exec rdsadmin.rdsadmin_util.add_logfile(bytes => 536870912);
exec rdsadmin.rdsadmin_util.add_logfile(bytes => 536870912);
exec rdsadmin.rdsadmin_util.add_logfile(bytes => 536870912);

/* Query V$LOG to see the logs. */
/* Now there are 8 logs. */

SELECT GROUP#, BYTES, STATUS FROM V$LOG;

GROUP# BYTES STATUS
----- -----
1 134217728 INACTIVE
2 134217728 CURRENT
3 134217728 INACTIVE
4 134217728 INACTIVE
5 536870912 UNUSED
6 536870912 UNUSED
7 536870912 UNUSED
8 536870912 UNUSED

/* Drop each inactive log using the group number. */

exec rdsadmin.rdsadmin_util.drop_logfile(grp => 1);
exec rdsadmin.rdsadmin_util.drop_logfile(grp => 3);
exec rdsadmin.rdsadmin_util.drop_logfile(grp => 4);

/* Query V$LOG to see the logs. */
/* Now there are 5 logs. */

select GROUP#, BYTES, STATUS from V$LOG;

GROUP# BYTES STATUS
----- -----
2 134217728 CURRENT
5 536870912 UNUSED
6 536870912 UNUSED
7 536870912 UNUSED
8 536870912 UNUSED

/* Switch logs so that group 2 is no longer current. */

exec rdsadmin.rdsadmin_util.switch_logfile;

/* Query V$LOG to see the logs. */
/* Now one of the new logs is current. */

SQL>SELECT GROUP#, BYTES, STATUS FROM V$LOG;

GROUP# BYTES STATUS
----- -----
2 134217728 ACTIVE
5 536870912 CURRENT
6 536870912 UNUSED
7 536870912 UNUSED
8 536870912 UNUSED

```

```

/* If the status of log 2 is still "ACTIVE", issue a checkpoint to clear it to "INACTIVE".
 */

exec rdsadmin.rdsadmin_util.checkpoint;

/* Query V$LOG to see the logs. */
/* Now the final original log is inactive. */

select GROUP#, BYTES, STATUS from V$LOG;

GROUP# BYTES STATUS
----- -----
2 134217728 INACTIVE
5 536870912 CURRENT
6 536870912 UNUSED
7 536870912 UNUSED
8 536870912 UNUSED

Drop the final inactive log.

exec rdsadmin.rdsadmin_util.drop_logfile(grp => 2);

/* Query V$LOG to see the logs. */
/* Now there are four 512 MB logs. */

SELECT GROUP#, BYTES, STATUS FROM V$LOG;

GROUP# BYTES STATUS
----- -----
5 536870912 CURRENT
6 536870912 UNUSED
7 536870912 UNUSED
8 536870912 UNUSED

```

## Retaining archived redo logs

You can retain archived redo logs locally on your DB instance for use with products like Oracle LogMiner (DBMS\_LOGMNR). After you have retained the redo logs, you can use LogMiner to analyze the logs. For more information, see [Using LogMiner to analyze redo log files](#) in the Oracle documentation.

To retain archived redo logs, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.set_configuration`. The `set_configuration` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>name</code>	varchar	—	Yes	The name of the configuration to update.
<code>value</code>	varchar	—	Yes	The value for the configuration.

The following example retains 24 hours of redo logs.

```

begin
 rdsadmin.rdsadmin_util.set_configuration(

```

```
 name => 'archivelog retention hours',
 value => '24');
end;
/
commit;
```

**Note**

The commit is required for the change to take effect.

To view how long archived redo logs are kept for your DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.show_configuration`.

The following example shows the log retention time.

```
set serveroutput on
exec rdsadmin.rdsadmin_util.show_configuration;
```

The output shows the current setting for `archivelog retention hours`. The following output shows that archived redo logs are kept for 48 hours.

```
NAME:archivelog retention hours
VALUE:48
DESCRIPTION:ArchiveLog expiration specifies the duration in hours before archive/redo log
files are automatically deleted.
```

Because the archived redo logs are retained on your DB instance, ensure that your DB instance has enough allocated storage for the retained logs. To determine how much space your DB instance has used in the last X hours, you can run the following query, replacing X with the number of hours.

```
select sum(BLOCKS * BLOCK_SIZE) bytes
 from V$ARCHIVED_LOG
 where FIRST_TIME >= SYSDATE-(X/24) and DEST_ID=1;
```

Archived redo logs are only generated if the backup retention period of your DB instance is greater than zero. By default the backup retention period is greater than zero, so unless you explicitly set yours to zero, archived redo logs are generated for your DB instance.

After the archived redo logs are removed from your DB instance, you can't download them again to your DB instance. Amazon RDS retains the archived redo logs outside of your DB instance to support restoring your DB instance to a point in time. Amazon RDS retains the archived redo logs outside of your DB instance based on the backup retention period configured for your DB instance. To modify the backup retention period for your DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

**Note**

In some cases, you might be using JDBC on Linux to download archived redo logs and experience long latency times and connection resets. In such cases, the issues might be caused by the default random number generator setting on your Java client. We recommend setting your JDBC drivers to use a nonblocking random number generator.

## Accessing transaction logs

Accessing transaction logs is supported for version 12.1.0.2.v7 and later of Oracle Database 12c Release 1 (12.1), all Oracle Database 12c Release 2 (12.2.0.1) versions, all Oracle Database 18c versions, and all Oracle Database 19c versions.

You might want to access your online and archived redo log files for mining with external tools such as GoldenGate, Attunity, Informatica, and others. If you want to access your online and archived redo log files, you must first create directory objects that provide read-only access to the physical file paths.

The following code creates directories that provide read-only access to your online and archived redo log files:

**Important**

This code also revokes the `DROP ANY DIRECTORY` privilege.

```
exec rdsadmin.rdsadmin_master_util.create_archivelog_dir;
exec rdsadmin.rdsadmin_master_util.create_onlinelog_dir;
```

After you create directory objects for your online and archived redo log files, you can read the files by using PL/SQL. For more information about reading files from directory objects, see [Listing files in a DB instance directory \(p. 1109\)](#) and [Reading files in a DB instance directory \(p. 1109\)](#).

The following code drops the directories for your online and archived redo log files.

```
exec rdsadmin.rdsadmin_master_util.drop_archivelog_dir;
exec rdsadmin.rdsadmin_master_util.drop_onlinelog_dir;
```

The following code grants and revokes the `DROP ANY DIRECTORY` privilege.

```
exec rdsadmin.rdsadmin_master_util.revoke_drop_any_directory;
exec rdsadmin.rdsadmin_master_util.grant_drop_any_directory;
```

## Performing common RMAN tasks for Oracle DB instances

In the following section, you can find how you can perform Oracle Recovery Manager (RMAN) DBA tasks on your Amazon RDS DB instances running Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances. It also restricts access to certain system procedures and tables that require advanced privileges.

You can use the Amazon RDS package `rdsadmin.rdsadmin_rman_util` to perform RMAN backups of your Amazon RDS for Oracle database to disk. The `rdsadmin.rdsadmin_rman_util` package supports full and incremental database file backups, tablespace backups, and archive log backups.

RMAN backups consume storage space on the Amazon RDS DB instance host. When you perform a backup, you specify an Oracle directory object as a parameter in the procedure call. The backup files are placed in the specified directory. You can use default directories, such as `DATA_PUMP_DIR`, or create a new directory. For more information, see [Creating and dropping directories in the main data storage space \(p. 1108\)](#).

After an RMAN backup has finished, you can copy the backup files off the Amazon RDS for Oracle DB instance host. You might do this for the purpose of restoring to a non-RDS host or for long-term storage of backups. For example, you can copy the backup files to an Amazon S3 bucket. For more information, see using [Amazon S3 integration \(p. 1139\)](#).

The backup files for RMAN backups remain on the Amazon RDS DB instance host until you remove them manually. You can use the `UTL_FILE.FREMOVE` Oracle procedure to remove files from a directory. For more information, see [FREMOVE procedure](#) in the Oracle documentation.

When backing up archived redo logs or performing a full or incremental backup that includes archived redo logs, redo log retention must be set to a nonzero value. For more information, see [Retaining archived redo logs \(p. 1079\)](#).

**Note**

For backing up and restoring to another Amazon RDS for Oracle DB instance, you can continue to use the Amazon RDS backup and restore features. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#)

Currently, RMAN restore isn't supported for Amazon RDS for Oracle DB instances.

## Common parameters for RMAN procedures

You can use procedures in the Amazon RDS package `rdsadmin.rdsadmin_rman_util` to perform tasks with RMAN. Several parameters are common to the procedures in the package. The package has the following common parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_owner</code>	varchar2	A valid owner of the directory specified in <code>p_directory_name</code> .	—	Yes	The owner of the directory to contain the backup files.
<code>p_directory_name</code>	varchar2	A valid database directory name.	—	Yes	The name of the directory to contain the backup files.
<code>p_label</code>	varchar2	a-z, A-Z, 0-9, '_', '- ', '.'	—	No	A unique string that is included in the backup file names.  <b>Note</b> The limit is 30 characters.
<code>p_compress</code>	boolean	TRUE, FALSE	FALSE	No	Specify TRUE to enable BASIC backup compression.  Specify FALSE to disable BASIC backup compression.

Parameter name	Data type	Valid values	Default	Required	Description
p_include_archive_logs	boolean	TRUE, FALSE	FALSE	No	<p>Specify TRUE to include archived redo logs in the backup.</p> <p>Specify FALSE to exclude archived redo logs from the backup.</p> <p>If you include archived redo logs in the backup, set retention to one hour or greater using the <code>rdsadmin.rdsadmin_util.set_co</code> procedure. Also, call the <code>rdsadmin.rdsadmin_rman_util.co</code> procedure immediately before running the backup. Otherwise, the backup might fail due to missing archived redo log files that have been deleted by Amazon RDS management procedures.</p>
p_include_controlfile	boolean	TRUE, FALSE	FALSE	No	<p>Specify TRUE to include the control file in the backup.</p> <p>Specify FALSE to exclude the control file from the backup.</p>
p_optimize	boolean	TRUE, FALSE	TRUE	No	<p>Specify TRUE to enable backup optimization, if archived redo logs are included, to reduce backup size.</p> <p>Specify FALSE to disable backup optimization.</p>

Parameter name	Data type	Valid values	Default	Required	Description
p_parallel	number	A valid integer between 1 and 254 for Oracle Database Enterprise Edition (EE) 1 for other Oracle Database editions	1	No	Number of channels.
p_rman_to_dbms_output	boolean	TRUE, FALSE	FALSE	No	When TRUE, the RMAN output is sent to the DBMS_OUTPUT package in addition to a file in the BDUMP directory. In SQL*Plus, use SET SERVEROUTPUT ON to see the output.  When FALSE, the RMAN output is only sent to a file in the BDUMP directory.
p_section_size_mb	number	A valid integer	NULL	No	The section size in megabytes (MB).  Validates in parallel by dividing each file into the specified section size.  When NULL, the parameter is ignored.

Parameter name	Data type	Valid values	Default	Required	Description
p_validation_type	varchar2	'PHYSICAL' 'PHYSICAL+LOGICAL'	'PHYSICAL'	'No'	<p>The level of corruption detection.</p> <p>Specify 'PHYSICAL' to check for physical corruption. An example of physical corruption is a block with a mismatch in the header and footer.</p> <p>Specify 'PHYSICAL+LOGICAL' to check for logical inconsistencies in addition to physical corruption. An example of logical corruption is a corrupt block.</p>

## Validating DB instance files

You can use the Amazon RDS package `rdsadmin.rdsadmin_rman_util` to validate Amazon RDS for Oracle DB instance files, such as data files, tablespaces, control files, or server parameter files (SPFILEs).

For more information about RMAN validation, see [Validating database files and backups](#) and [VALIDATE](#) in the Oracle documentation.

### Topics

- [Validating a DB instance \(p. 1085\)](#)
- [Validating a tablespace \(p. 1086\)](#)
- [Validating a control file \(p. 1087\)](#)
- [Validating an SPFILE \(p. 1087\)](#)
- [Validating a data file \(p. 1087\)](#)

## Validating a DB instance

To validate all of the relevant files used by an Amazon RDS Oracle DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.validate_database`.

This procedure uses the following common parameters for RMAN tasks:

- `p_validation_type`
- `p_parallel`
- `p_section_size_mb`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

The following example validates the DB instance using the default values for the parameters.

```
exec rdsadmin.rdsadmin_rman_util.validate_database;
```

The following example validates the DB instance using the specified values for the parameters.

```
BEGIN
 rdsadmin.rdsadmin_rman_util.validate_database(
 p_validation_type => 'PHYSICAL+LOGICAL',
 p_parallel => 4,
 p_section_size_mb => 10,
 p_rman_to_dbms_output => FALSE);
END;
/
```

When the `p_rman_to_dbms_output` parameter is set to `FALSE`, the RMAN output is written to a file in the `BDUMP` directory.

To view the files in the `BDUMP` directory, run the following `SELECT` statement.

```
SELECT * FROM table(rdsadmin.rds_file_util.listdir('BDUMP')) order by mtime;
```

To view the contents of a file in the `BDUMP` directory, run the following `SELECT` statement.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'rds-rman-
validate-nnn.txt'));
```

Replace the file name with the name of the file you want to view.

## Validating a tablespace

To validate the files associated with a tablespace, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.validate_tablespace`.

This procedure uses the following common parameters for RMAN tasks:

- `p_validation_type`
- `p_parallel`
- `p_section_size_mb`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameter.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_tablespace_name</code>	varchar2	A valid tablespace name	—	Yes	The name of the tablespace.

## Validating a control file

To validate only the control file used by an Amazon RDS Oracle DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.validate_current_controlfile`.

This procedure uses the following common parameter for RMAN tasks:

- `p_validation_type`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

## Validating an SPFILE

To validate only the server parameter file (SPFILE) used by an Amazon RDS Oracle DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.validate_spfile`.

This procedure uses the following common parameter for RMAN tasks:

- `p_validation_type`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

## Validating a data file

To validate a data file, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.validate_datafile`.

This procedure uses the following common parameters for RMAN tasks:

- `p_validation_type`
- `p_parallel`
- `p_section_size_mb`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_datafile</code>	varchar2	A valid datafile ID number or a valid datafile name including complete path	—	Yes	The datafile ID number (from <code>v\$datafile.file#</code> ) or the full datafile name including the path (from <code>v\$datafile.name</code> ).

Parameter name	Data type	Valid values	Default	Required	Description
p_from_block	number	A valid integer	NULL	No	The number of the block where the validation starts within the data file. When this is NULL, 1 is used.
p_to_block	number	A valid integer	NULL	No	The number of the block where the validation ends within the data file. When this is NULL, the maximum block in the data file is used.

## Enabling and disabling block change tracking

Block changing tracking records changed blocks in a tracking file. This technique can improve the performance of incremental backups. For more information, see [Using Block Change Tracking to Improve Incremental Backup Performance](#) in the Oracle Database documentation.

To enable block change tracking for a DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.enable_block_change_tracking`. To disable block change tracking, use `disable_block_change_tracking`. These procedures take no parameters.

Read-only replicas support block change tracking. If you create a read-only replica from a source DB that uses block change tracking, the replica uses block change tracking. You can't enable block change tracking on a mounted replica. If you place a mounted replica in read-only mode, block change tracking isn't enabled, but you can enable it using `enable_block_change_tracking`. If you promote an Oracle replica to a source DB, you can use block change tracking just as for any other Oracle DB instance.

Block change tracking procedures are supported for the following DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

### Note

In a single-tenant CDB, the following operations work, but no customer-visible mechanism can detect the current status of the operations. See also [Limitations of a single-tenant CDB \(p. 1012\)](#).

To determine whether block change tracking is enabled for your DB instance, run the following query.

```
SELECT STATUS, FILENAME FROM V$BLOCK_CHANGE_TRACKING;
```

The following example enables block change tracking for a DB instance.

```
EXEC rdsadmin.rdsadmin_rman_util.enable_block_change_tracking;
```

The following example disables block change tracking for a DB instance.

```
EXEC rdsadmin.rdsadmin_rman_util.disable_block_change_tracking;
```

## Crosschecking archived redo logs

You can crosscheck archived redo logs using the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.crosscheck_archivelog`.

You can use this procedure to crosscheck the archived redo logs registered in the control file and optionally delete the expired logs records. When RMAN makes a backup, it creates a record in the control file. Over time, these records increase the size of the control file. We recommend that you remove expired records periodically.

**Note**

Standard Amazon RDS backups don't use RMAN and therefore don't create records in the control file.

This procedure uses the common parameter `p_rman_to_dbms_output` for RMAN tasks.

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameter.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_delete_expired</code>	boolean	TRUE, FALSE	TRUE	No	When <code>TRUE</code> , delete expired archived redo log records from the control file.  When <code>FALSE</code> , retain the expired archived redo log records in the control file.

This procedure is supported for the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

The following example marks archived redo log records in the control file as expired, but does not delete the records.

```
BEGIN
 rdsadmin.rdsadmin_rman_util.crosscheck_archivelog(
 p_delete_expired => FALSE,
 p_rman_to_dbms_output => FALSE);
END;
/
```

The following example deletes expired archived redo log records from the control file.

```
BEGIN
```

```
rdsadmin.rdsadmin_rman_util.crosscheck_archivelog(
 p_delete_expired => TRUE,
 p_rman_to_dbms_output => FALSE);
END;
/
```

## Backing up archived redo logs

You can use the Amazon RDS package `rdsadmin.rdsadmin_rman_util` to back up archived redo logs for an Amazon RDS Oracle DB instance.

The procedures for backing up archived redo logs are supported for the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

### Topics

- [Backing up all archived redo logs \(p. 1090\)](#)
- [Backing up an archived redo log from a date range \(p. 1091\)](#)
- [Backing up an archived redo log from an SCN range \(p. 1092\)](#)
- [Backing up an archived redo log from a sequence number range \(p. 1093\)](#)

## Backing up all archived redo logs

To back up all of the archived redo logs for an Amazon RDS Oracle DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_archivelog_all`.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

The following example backs up all archived redo logs for the DB instance.

```
BEGIN
 rdsadmin.rdsadmin_rman_util.backup_archivelog_all(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_parallel => 4,
 p_rman_to_dbms_output => FALSE);
END;
/
```

## Backing up an archived redo log from a date range

To back up specific archived redo logs for an Amazon RDS Oracle DB instance by specifying a date range, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_archivelog_date`. The date range specifies which archived redo logs to back up.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_from_date</code>	date	A date that is between the <code>start_date</code> and <code>next_date</code> of an archived redo log that exists on disk. The value must be less than or equal to the value specified for <code>p_to_date</code> .	—	Yes	The starting date for the archived log backups.
<code>p_to_date</code>	date	A date that is between the <code>start_date</code> and <code>next_date</code> of an archived redo log that exists on disk.	—	Yes	The ending date for the archived log backups.

Parameter name	Data type	Valid values	Default	Required	Description
		The value must be greater than or equal to the value specified for <code>p_from_date</code> .			

The following example backs up archived redo logs in the date range for the DB instance.

```

BEGIN
 rdsadmin.rdsadmin_rman_util.backup_archivelog_date(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_from_date => '03/01/2019 00:00:00',
 p_to_date => '03/02/2019 00:00:00',
 p_parallel => 4,
 p_rman_to_dbms_output => FALSE);
END;
/

```

## Backing up an archived redo log from an SCN range

To back up specific archived redo logs for an Amazon RDS Oracle DB instance by specifying a system change number (SCN) range, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_archivelog_scn`. The SCN range specifies which archived redo logs to back up.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_from_scn</code>	number	An SCN of an archived redo log	—	Yes	The starting SCN for the archived log backups.

Parameter name	Data type	Valid values	Default	Required	Description
		that exists on disk. The value must be less than or equal to the value specified for p_to_scn.			
p_to_scn	number	An SCN of an archived redo log that exists on disk. The value must be greater than or equal to the value specified for p_from_scn.	—	Yes	The ending SCN for the archived log backups.

The following example backs up archived redo logs in the SCN range for the DB instance.

```

BEGIN
 rdsadmin.rdsadmin_rman_util.backup_archivelog_scn(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_from_scn => 1533835,
 p_to_scn => 1892447,
 p_parallel => 4,
 p_rman_to_dbms_output => FALSE);
END;
/

```

## Backing up an archived redo log from a sequence number range

To back up specific archived redo logs for an Amazon RDS Oracle DB instance by specifying a sequence number range, use the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_archivelog_sequence`. The sequence number range specifies which archived redo logs to back up.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`

- `p_parallel`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_from_sequence</code>	number	A sequence number of an archived redo log that exists on disk. The value must be less than or equal to the value specified for <code>p_to_sequence</code> .	—	Yes	The starting sequence number for the archived log backups.
<code>p_to_sequence</code>	number	A sequence number of an archived redo log that exists on disk. The value must be greater than or equal to the value specified for <code>p_from_sequence</code> .	—	Yes	The ending sequence number for the archived log backups.

The following example backs up archived redo logs in the sequence number range for the DB instance.

```

BEGIN
 rdsadmin.rdsadmin_rman_util.backup_archivelog_sequence(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_from_sequence => 11160,
 p_to_sequence => 11160,
 p_parallel => 4,
 p_rman_to_dbms_output => FALSE);

```

```
END;
/
```

## Performing a full database backup

You can perform a backup of all blocks of data files included in the backup using Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_database_full`.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_section_size_mb`
- `p_include_archive_logs`
- `p_optimize`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure is supported for the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

The following example performs a full backup of the DB instance using the specified values for the parameters.

```
BEGIN
 rdsadmin.rdsadmin_rman_util.backup_database_full(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_parallel => 4,
 p_section_size_mb => 10,
 p_rman_to_dbms_output => FALSE);
END;
/
```

## Performing an incremental database backup

You can perform an incremental backup of your DB instance using the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_database_incremental`.

For more information about incremental backups, see [Incremental backups](#) in the Oracle documentation.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`

- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_section_size_mb`
- `p_include_archive_logs`
- `p_include_controlfile`
- `p_optimize`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure is supported for the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

This procedure also uses the following additional parameter.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_level</code>	number	0, 1	0	No	<p>Specify 0 to enable a full incremental backup.</p> <p>Specify 1 to enable a non-cumulative incremental backup.</p>

The following example performs an incremental backup of the DB instance using the specified values for the parameters.

```

BEGIN
 rdsadmin.rdsadmin_rman_util.backup_database_incremental(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_level => 1,
 p_parallel => 4,
 p_section_size_mb => 10,
 p_rman_to_dbms_output => FALSE);
END;
/

```

## Performing a tablespace backup

You can perform a DB instance tablespace using the Amazon RDS procedure `rdsadmin.rdsadmin_rman_util.backup_tablespace`.

This procedure uses the following common parameters for RMAN tasks:

- `p_owner`
- `p_directory_name`
- `p_label`
- `p_parallel`
- `p_section_size_mb`
- `p_include_archive_logs`
- `p_include_controlfile`
- `p_optimize`
- `p_compress`
- `p_rman_to_dbms_output`

For more information, see [Common parameters for RMAN procedures \(p. 1082\)](#).

This procedure also uses the following additional parameter.

Parameter name	Data type	Valid values	Default	Required	Description
<code>p_tablespace_name</code>	varchar2	A valid tablespace name.	—	Yes	The name of the tablespace to back up.

This procedure is supported for the following Amazon RDS for Oracle DB engine versions:

- 12.1.0.2.v15 or higher 12.1 versions
- 12.2.0.1.ru-2019-01.rur-2019-01.r1 or higher 12.2 versions
- All 18.0.0.0 versions
- All 19.0.0.0 versions

The following example performs a tablespace backup using the specified values for the parameters.

```

BEGIN
 rdsadmin.rdsadmin_rman_util.backup_tablespace(
 p_owner => 'SYS',
 p_directory_name => 'MYDIRECTORY',
 p_tablespace_name => 'MYTABLESPACE',
 p_parallel => 4,
 p_section_size_mb => 10,
 p_rman_to_dbms_output => FALSE);
END;
/

```

## Performing common scheduling tasks for Oracle DB instances

Some SYS-owned scheduler jobs can interfere with normal database operations, and Oracle Support recommends they be disabled or the job schedule be modified. You can use the Amazon RDS package `rdsadmin.rdsadmin_dbms_scheduler` to perform tasks for SYS-owned Oracle Scheduler jobs.

These procedures are supported for the following Amazon RDS for Oracle DB engine versions:

- 19c
- 18c
- 12.2.0.2.ru-2019-07.rur-2019-07.r1 or higher 12.2 versions
- 12.1.0.2.v17 or higher 12.1 versions

## Common parameters for Oracle Scheduler procedures

To perform tasks with Oracle Scheduler, use procedures in the Amazon RDS package `rdsadmin.rdsadmin_dbms_scheduler`. Several parameters are common to the procedures in the package. The package has the following common parameters.

Parameter name	Data type	Valid values	Default	Required	Description
name	varchar2	'SYS.BSLN_MAINTAIN_STATS_JOB', 'SYS.CLEANUP_ONLINE_IND_BUILD', 'SYS.BSLN_MAINTAIN_STATS_JOB'	Yes	No	The name of the job to modify.  <b>Note</b> Currently, you can only modify <code>SYS.CLEANUP_ONLINE_IND_BUILD</code> and <code>SYS.BSLN_MAINTAIN_STATS_JOB</code> jobs.
attribute	varchar2	'REPEAT_INTERVAL', 'SCHEUDLE_NAME'	Yes	No	To modify the repeat interval for the job, specify 'REPEAT_INTERVAL'.  To modify the schedule name for the job, specify 'SCHEUDLE_NAME'.
value	varchar2	A valid schedule interval or schedule name, depending on attribute used.	-	Yes	The new value of the attribute.

## Modifying DBMS\_SCHEDULER jobs

You can use the Oracle procedure `dbms_scheduler.set_attribute` to modify certain components of Oracle Scheduler. For more information, see [DBMS\\_SCHEDULER](#) and [SET\\_ATTRIBUTE procedure](#) in the Oracle documentation.

When working with Amazon RDS DB instances, prepend the schema name `SYS` to the object name. The following example sets the resource plan attribute for the Monday window object.

```
begin
 dbms_scheduler.set_attribute(
 name => 'SYS.MONDAY_WINDOW',
 attribute => 'RESOURCE_PLAN',
 value => 'resource_plan_1');
end;
/
```

**Note**

Some SYS-owned Oracle Scheduler jobs can interfere with normal database operations. Oracle Support recommends that they be disabled or that the job schedule be modified. Amazon RDS for Oracle doesn't provide the required privileges to modify SYS-owned Oracle Scheduler jobs using the `DBMS_SCHEDULER` package. Instead, you can use the procedures in the Amazon RDS package `rdsadmin.rdsadmin_dbms_scheduler` to perform tasks for SYS-owned Oracle Scheduler jobs. For information about using these procedures, see [Performing common scheduling tasks for Oracle DB instances \(p. 1097\)](#).

## Setting the time zone for Oracle Scheduler jobs

To modify the time zone for Oracle Scheduler, you can use the Oracle procedure `dbms_scheduler.set_scheduler_attribute`. For more information about the `dbms_scheduler` package, see [DBMS\\_SCHEDULER](#) and [SET\\_SCHEDULER\\_ATTRIBUTE](#) in the Oracle documentation.

### To modify the current time zone setting

1. Connect to the database using a client such as SQL Developer. For more information, see [Connecting to your DB instance using Oracle SQL developer \(p. 1015\)](#).
2. Set the default time zone as following, substituting your time zone for `time_zone_name`.

```
begin
 dbms_scheduler.set_scheduler_attribute(
 attribute => 'default_timezone',
 value => 'time_zone_name'
);
end;
/
```

In the following example, you change the time zone to Asia/Shanghai.

Start by querying the current time zone, as shown following.

```
SELECT VALUE FROM DBA_SCHEDULER_GLOBAL_ATTRIBUTE WHERE ATTRIBUTE_NAME='DEFAULT_TIMEZONE';
```

The output shows that the current time zone is ETC/UTC.

VALUE
-----
Etc/UTC

Then you set the time zone to Asia/Shanghai.

```
begin
```

```
dbms_scheduler.set_scheduler_attribute(
 attribute => 'default_timezone',
 value => 'Asia/Shanghai'
);
end;
/
```

For more information about changing the system time zone, see [Oracle time zone \(p. 1213\)](#).

## Disabling SYS-owned Oracle Scheduler jobs

To disable a SYS-owned Oracle Scheduler job, use the `rdsadmin.rdsadmin_dbms_scheduler.disable` procedure.

This procedure uses the `name` common parameter for Oracle Scheduler tasks. For more information, see [Common parameters for Oracle Scheduler procedures \(p. 1098\)](#).

The following example disables the `SYS.CLEANUP_ONLINE_IND_BUILD` Oracle Scheduler job.

```
BEGIN
 rdsadmin.rdsadmin_dbms_scheduler.disable('SYS.CLEANUP_ONLINE_IND_BUILD');
END;
/
```

## Enabling SYS-owned Oracle Scheduler jobs

To enable a SYS-owned Oracle Scheduler job, use the `rdsadmin.rdsadmin_dbms_scheduler.enable` procedure.

This procedure uses the `name` common parameter for Oracle Scheduler tasks. For more information, see [Common parameters for Oracle Scheduler procedures \(p. 1098\)](#).

The following example enables the `SYS.CLEANUP_ONLINE_IND_BUILD` Oracle Scheduler job.

```
BEGIN
 rdsadmin.rdsadmin_dbms_scheduler.enable('SYS.CLEANUP_ONLINE_IND_BUILD');
END;
/
```

## Modifying the repeat interval for jobs of CALENDAR type

To modify the repeat interval to modify a SYS-owned Oracle Scheduler job of `CALENDAR` type, use the `rdsadmin.rdsadmin_dbms_scheduler.disable` procedure.

This procedure uses the following common parameters for Oracle Scheduler tasks:

- `name`
- `attribute`
- `value`

For more information, see [Common parameters for Oracle Scheduler procedures \(p. 1098\)](#).

The following example modifies the repeat interval of the `SYS.CLEANUP_ONLINE_IND_BUILD` Oracle Scheduler job.

```

BEGIN
 rdsadmin.rdsadmin_dbms_scheduler.set_attribute(
 name => 'SYS.CLEANUP_ONLINE_IND_BUILD',
 attribute => 'repeat_interval',
 value => 'freq=daily;byday=FRI,SAT;byhour=20;byminute=0;bysecond=0');
END;
/

```

## Modifying the repeat interval for jobs of NAMED type

Some Oracle Scheduler jobs use a schedule name instead of an interval. For this type of jobs, you must create a new named schedule in the master user schema. Use the standard Oracle `sys.dbms_scheduler.create_schedule` procedure to do this. Also, use the `rdsadmin.rdsadmin_dbms_scheduler.set_attribute` procedure to assign the new named schedule to the job.

This procedure uses the following common parameter for Oracle Scheduler tasks:

- `name`
- `attribute`
- `value`

For more information, see [Common parameters for Oracle Scheduler procedures \(p. 1098\)](#).

The following example modifies the repeat interval of the `SYS.BSLN_MAINTAIN_STATS_JOB` Oracle Scheduler job.

```

BEGIN
 dbms_scheduler.create_schedule (
 schedule_name => 'rds_master_user.new_schedule',
 start_date => SYSTIMESTAMP,
 repeat_interval =>
 'freq=daily;byday=MON,TUE,WED,THU,FRI;byhour=0;byminute=0;bysecond=0',
 end_date => NULL,
 comments => 'Repeats daily forever');
END;
/

BEGIN
 rdsadmin.rdsadmin_dbms_scheduler.set_attribute (
 name => 'SYS.BSLN_MAINTAIN_STATS_JOB',
 attribute => 'schedule_name',
 value => 'rds_master_user.new_schedule');
END;
/

```

## Performing common diagnostic tasks for Oracle DB instances

Oracle Database includes a fault diagnosability infrastructure that you can use to investigate database problems. In Oracle terminology, a *problem* is a critical error such as a code bug or data corruption. An *incident* is the occurrence of a problem. If the same error occurs three times, then the infrastructure shows three incidents of this problem. For more information, see [Diagnosing and resolving problems](#) in the Oracle Database documentation.

The Automatic Diagnostic Repository Command Interpreter (ADRCI) utility is an Oracle command-line tool that you use to manage diagnostic data. For example, you can use this tool to investigate problems and package diagnostic data. An *incident package* includes diagnostic data for an incident or all incidents that reference a specific problem. You can upload an incident package, which is implemented as a .zip file, to Oracle Support.

To deliver a managed service experience, Amazon RDS doesn't provide shell access to ADRCI. To perform diagnostic tasks for your Oracle instance, instead use the Amazon RDS package `rdsadmin.rdsadmin_adrci_util`.

By using the functions in `rdsadmin_adrci_util`, you can list and package problems and incidents, and also show trace files. All functions return a task ID. This ID forms part of the name of log file that contains the ADRCI output, as in `dbtask-task_id.log`. The log file resides in the BDUMP directory.

## Common parameters for diagnostic procedures

To perform diagnostic tasks, use functions in the Amazon RDS package `rdsadmin.rdsadmin_adrci_util`. The package has the following common parameters.

Parameter name	Data type	Valid values	Default	Required	Description
<code>incident_id</code>	number	A valid incident ID or null	Null	No	If the value is null, the function shows all incidents. If the value isn't null and represents a valid incident ID, the function shows the specified incident.
<code>problem_id</code>	number	A valid problem ID or null	Null	No	If the value is null, the function shows all problems. If the value isn't null and represents a valid problem ID, the function shows the specified problem.
<code>last</code>	number	A valid integer greater than 0 or null	Null	No	If the value is null, then the function displays at most 50 items. If the value isn't null, the function displays the specified number.

## Listing incidents

To list diagnostic incidents for Oracle, use the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.list_adrci_incidents`. You can list incidents in either basic or detailed mode. By default, the function lists the 50 most recent incidents.

This function uses the following common parameters:

- `incident_id`
- `problem_id`

If you specify both of the preceding parameters, `incident_id` overrides `problem_id`. For more information, see [Common parameters for diagnostic procedures \(p. 1102\)](#).

This function uses the following additional parameter.

Parameter name	Data type	Valid values	Default	Required	Description
<code>detail</code>	boolean	TRUE or FALSE	FALSE	No	If TRUE, the function lists incidents in detail mode. If FALSE, the function lists incidents in basic mode.

To list all incidents, call the `rdsadmin.rdsadmin_adrci_util.list_adrci_incidents` function without any arguments. You can store the output in a SQL client variable.

```
SQL> VAR task_id VARCHAR2(80);
SQL> exec :task_id := rdsadmin.rdsadmin_adrci_util.list_adrci_incidents;
PL/SQL procedure successfully completed.
```

To get the task ID, specify the variable in a query of the `DUAL` table.

```
SQL> SELECT :task_id FROM DUAL;
:TASK_ID

1590786706158-3126
```

To read the log file, call the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`. Supply the task ID as part of the file name. The following output shows three incidents: 53523, 53522, and 53521.

```
SQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
'dbtask-'||:task_id||'.log'));
TEXT

2020-05-29 21:11:46.193 UTC [INFO] Listing ADRCI incidents.
2020-05-29 21:11:46.256 UTC [INFO]
ADR Home = /rdsdbdata/log/diag/rdbms/orcl_a/ORCL:

## Listing problems

To list diagnostic problems for Oracle, use the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.list_adrci_problems`.

By default, the function lists the 50 most recent problems.

This function uses the common parameter `problem_id`. For more information, see [Common parameters for diagnostic procedures \(p. 1102\)](#).

To get the task ID for all problems, call the `rdsadmin.rdsadmin_adrci_util.list_adrci_problems` function without any arguments, and store the output in a SQL client variable.

```
SQL> exec :task_id := rdsadmin.rdsadmin_adrci_util.list_adrci_problems;

PL/SQL procedure successfully completed.
```

To read the log file, call the `rdsadmin.rds_file_util.read_text_file` function, supplying the task ID as part of the file name. In the following output, the log file shows three problems: 1, 2, and 3.

```
SQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
 'dbtask-'||:task_id||'.log'));

## Creating incident packages

You can create incident packages using the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.create_adrci_package`. The output is a .zip file that you can supply to Oracle Support.

This function uses the following common parameters:

- `problem_id`

- `incident_id`

Make sure to specify one of the preceding parameters. If you specify both parameters, `incident_id` overrides `problem_id`. For more information, see [Common parameters for diagnostic procedures \(p. 1102\)](#).

To create a package for a specific incident, call the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.create_adrci_package` with the `incident_id` parameter. The following example creates a package for incident 53523.

```
SQL> exec :task_id :=
 rdsadmin.rdsadmin_adrci_util.create_adrci_package(incident_id=>53523);

PL/SQL procedure successfully completed.
```

To read the log file, call the `rdsadmin.rds_file_util.read_text_file`. You can supply the task ID as part of the file name. The output shows that you generated incident package `ORA700EVE_20200529212043_COM_1.zip`.

```
SSQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
 'dbtask-'||:task_id||'.log'));

TEXT

2020-05-29 21:20:43.031 UTC [INFO] The ADRCI package is being created.
2020-05-29 21:20:47.641 UTC [INFO] Generated package 1 in file /rdsdbdata/log/trace/
ORA700EVE_20200529212043_COM_1.zip, mode complete
2020-05-29 21:20:47.642 UTC [INFO] The ADRCI package was successfully created.
2020-05-29 21:20:47.642 UTC [INFO] The task finished successfully.
```

To package diagnostic data for a particular problem, specify its ID using the `problem_id` parameter. In the following example, you package data for problem 3 only.

```
SQL> exec :task_id := rdsadmin.rdsadmin_adrci_util.create_adrci_package(problem_id=>3);

PL/SQL procedure successfully completed.
```

To read the task output, call `rdsadmin.rds_file_util.read_text_file`, supplying the task ID as part of the file name. The output shows that you generated incident package `ORA700EVE_20200529212111_COM_1.zip`.

```
SSQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
 'dbtask-'||:task_id||'.log'));

TEXT

2020-05-29 21:21:11.050 UTC [INFO] The ADRCI package is being created.
2020-05-29 21:21:15.646 UTC [INFO] Generated package 2 in file /rdsdbdata/log/trace/
ORA700EVE_20200529212111_COM_1.zip, mode complete
2020-05-29 21:21:15.646 UTC [INFO] The ADRCI package was successfully created.
2020-05-29 21:21:15.646 UTC [INFO] The task finished successfully.
```

## Showing trace files

You can show trace files using the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.show_adrci_tracefile`.

This function uses the following parameter.

Parameter name	Data type	Valid values	Default	Required	Description
filename	varchar2	A valid trace file name	Null	No	If the value is null, the function shows all trace files. If it isn't null, the function shows the specified file.

To show the trace file, call the Amazon RDS function `rdsadmin.rdsadmin_adrci_util.show_adrci_tracefile` with the `incident_id` parameter.

```
SQL> exec :task_id := rdsadmin.rdsadmin_adrci_util.show_adrci_tracefile;
PL/SQL procedure successfully completed.
```

To list the trace file names, call the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`, supplying the task ID as part of the file name.

```
SQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
 'dbtask-'||:task_id||'.log')) WHERE TEXT LIKE '%/alert_%';
TEXT

diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log.2020-05-28
diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log.2020-05-27
diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log.2020-05-26
diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log.2020-05-25

diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log.2020-05-21
diag/rdbms/orcl_a/ORCL/trace/alert_ORCL.log

9 rows selected.
```

In the following example, you generate output for `alert_ORCL.log`.

```
SQL> exec :task_id := rdsadmin.rdsadmin_adrci_util.show_adrci_tracefile('diag/rdbms/orcl_a/
ORCL/trace/alert_ORCL.log');

PL/SQL procedure successfully completed.
```

To read the log file, call `rdsadmin.rds_file_util.read_text_file`. Supply the task ID as part of the file name. The output shows the first 10 lines of `alert_ORCL.log`.

```
SQL> SELECT * FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP',
 'dbtask-'||:task_id||'.log')) WHERE ROWNUM <= 10;

## Performing miscellaneous tasks for Oracle DB instances

Following, you can find how to perform miscellaneous DBA tasks on your Amazon RDS DB instances running Oracle. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances, and restricts access to certain system procedures and tables that require advanced privileges.

### Topics

- [Creating and dropping directories in the main data storage space \(p. 1108\)](#)
- [Listing files in a DB instance directory \(p. 1109\)](#)
- [Reading files in a DB instance directory \(p. 1109\)](#)
- [Accessing Opatch files \(p. 1110\)](#)
- [Managing advisor tasks \(p. 1111\)](#)
- [Enabling HugePages for an Oracle DB instance \(p. 1114\)](#)
- [Enabling extended data types \(p. 1116\)](#)

## Creating and dropping directories in the main data storage space

To create directories, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.create_directory`. You can create up to 10,000 directories, all located in your main data storage space. To drop directories, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.drop_directory`.

The `create_directory` and `drop_directory` procedures have the following required parameter.

Parameter name	Data type	Default	Required	Description
<code>p_directory_name</code>	varchar2	—	Yes	The name of the directory.

The following example creates a new directory named `PRODUCT_DESCRIPTIONS`.

```
exec rdsadmin.rdsadmin_util.create_directory(p_directory_name => 'product_descriptions');
```

The data dictionary stores the directory name in uppercase. You can list the directories by querying `DBA_DIRECTORIES`. The system chooses the actual host pathname automatically. The following example gets the directory path for the directory named `PRODUCT_DESCRIPTIONS`:

```
SELECT DIRECTORY_PATH
 FROM DBA_DIRECTORIES
 WHERE DIRECTORY_NAME='PRODUCT_DESCRIPTIONS';

DIRECTORY_PATH

```

/rdsdbdata/userdirs/01

The master user name for the DB instance has read and write privileges in the new directory, and can grant access to other users. `EXECUTE` privileges are not available for directories on a DB instance. Directories are created in your main data storage space and will consume space and I/O bandwidth.

The following example drops the directory named `PRODUCT_DESCRIPTIONS`.

```
exec rdsadmin.rdsadmin_util.drop_directory(p_directory_name => 'product_descriptions');
```

**Note**

You can also drop a directory by using the Oracle SQL command `DROP DIRECTORY`.

Dropping a directory doesn't remove its contents. Because the `rdsadmin.rdsadmin_util.create_directory` procedure can reuse pathnames, files in dropped directories can appear in a newly created directory. Before you drop a directory, we recommend that you use `UTL_FILE.FREMOVE` to remove files from the directory. For more information, see [FREMOVE procedure](#) in the Oracle documentation.

## Listing files in a DB instance directory

To list the files in a directory, use the Amazon RDS procedure `rdsadmin.rds_file_util.listdir`. The `listdir` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_directory</code>	varchar2	—	Yes	The name of the directory to list.

The following example lists the files in the directory named `PRODUCT_DESCRIPTIONS`.

```
SELECT * FROM TABLE(rdsadmin.rds_file_util.listdir(p_directory => 'PRODUCT_DESCRIPTIONS'));
```

## Reading files in a DB instance directory

To read a text file, use the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`. The `read_text_file` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_directory</code>	varchar2	—	Yes	The name of the directory that contains the file.
<code>p_filename</code>	varchar2	—	Yes	The name of the file to read.

The following example creates the file `rice.txt` in the directory `PRODUCT_DESCRIPTIONS`.

```
declare
 fh sys.utl_file.file_type;
begin
 fh := utl_file.fopen(location=>'PRODUCT_DESCRIPTIONS', filename=>'rice.txt',
 open_mode=>'w');
```

```
 utl_file.put(file=>fh, buffer=>'AnyCompany brown rice, 15 lbs');
 utl_file.fclose(file=>fh);
end;
/
```

The following example reads the file `rice.txt` from the directory `PRODUCT_DESCRIPTIONS`.

```
SELECT * FROM TABLE
 (rdsadmin.rds_file_util.read_text_file(
 p_directory => 'PRODUCT_DESCRIPTIONS',
 p_filename => 'rice.txt'));
```

## Accessing Opatch files

Opatch is an Oracle utility that enables the application and rollback of patches to Oracle software. The Oracle mechanism for determining which patches have been applied to a database is the `opatch lsinventory` command. To open service requests for Bring Your Own Licence (BYOL) customers, Oracle Support requests the `lsinventory` file and sometimes the `lsinventory_detail` file generated by Opatch.

To deliver a managed service experience, Amazon RDS doesn't provide shell access to Opatch. Instead, the Oracle DB instance automatically creates the inventory files every hour in the `BDUMP` directory. You have read and write access on this directory. If you don't see your files in `BDUMP`, or the files are out of date, wait an hour and then try again.

### Note

The examples in this section assume that the `BDUMP` directory is named `BDUMP`. On a read replica, the `BDUMP` directory name is different. To learn how to get the `BDUMP` name by querying `V$DATABASE.DB_UNIQUE_NAME` on a read replica, see [Listing files \(p. 551\)](#).

The inventory files use the Amazon RDS naming convention `lsinventory-dbv.txt` and `lsinventory_detail-dbv.txt`, where `dbv` is the full name of your DB version. The `lsinventory-dbv.txt` file is available on all DB versions. The corresponding detail file is available on the following DB versions:

- 19.0.0.0, ru-2020-01.rur-2020-01.r1 or later
- 18.0.0.0, ru-2020-01.rur-2020-01.r1 or later
- 12.2.0.1, ru-2020-01.rur-2020-01.r1 or later
- 12.1.0.2, v19 or later

For example, if your DB version is 19.0.0.0.ru-2020-04.rur-2020-04.r1, then your inventory files have the following names.

```
lsinventory-19.0.0.0.ru-2020-04.rur-2020-04.r1.txt
lsinventory_detail-19.0.0.0.ru-2020-04.rur-2020-04.r1.txt
```

Ensure that you download the files that match the current version of your DB engine.

### Console

#### To download an inventory file using the console

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.
3. Choose the name of the DB instance that has the log file that you want to view.
4. Choose the **Logs & events** tab.

5. Scroll down to the **Logs** section.
6. In the **Logs** section, search for `lsinventory`.
7. Select the file that you want to access, and then choose **Download**.

## SQL

To read the `lsinventory-dbv.txt` in a SQL client, you can use a `SELECT` statement. For this technique, use either of the following `rdsadmin` functions: `rdsadmin.rds_file_util.read_text_file` or `rdsadmin.tracefile_listing`.

In the following sample query, replace `dbv` with your Oracle DB version. For example, your DB version might be `19.0.0.0.ru-2020-04.rur-2020-04.r1`.

```
SELECT text
FROM TABLE(rdsadmin.rds_file_util.read_text_file('BDUMP', 'lsinventory-dbv.txt'));
```

## PL/SQL

To read the `lsinventory-dbv.txt` in a SQL client, you can write a PL/SQL program. This program uses `utl_file` to read the file, and `dbms_output` to print it. These are Oracle-supplied packages.

In the following sample program, replace `dbv` with your Oracle DB version. For example, your DB version might be `19.0.0.0.ru-2020-04.rur-2020-04.r1`.

```
SET SERVEROUTPUT ON
DECLARE
 v_file SYS.UTL_FILE.FILE_TYPE;
 v_line VARCHAR2(1000);
 v_oracle_home_type VARCHAR2(1000);
 c_directory VARCHAR2(30) := 'BDUMP';
 c_output_file VARCHAR2(30) := 'lsinventory-dbv.txt';
BEGIN
 v_file := SYS.UTL_FILE.FOPEN(c_directory, c_output_file, 'r');
 LOOP
 BEGIN
 SYS.UTL_FILE.GET_LINE(v_file, v_line,1000);
 DBMS_OUTPUT.PUT_LINE(v_line);
 EXCEPTION
 WHEN no_data_found THEN
 EXIT;
 END;
 END LOOP;
END;
/
```

Or query `rdsadmin.tracefile_listing`, and spool the output to a file. The following example spools the output to `/tmp/tracefile.txt`.

```
SPOOL /tmp/tracefile.txt
SELECT *
FROM rdsadmin.tracefile_listing
WHERE FILENAME LIKE 'lsinventory%';
SPOOL OFF;
```

## Managing advisor tasks

Oracle Database includes a number of advisors. Each advisor supports automated and manual tasks. You can use procedures in the `rdsadmin.rdsadmin_util` package to manage some advisor tasks.

The advisor task procedures are available in the following engine versions:

- [Version 19.0.0.0.ru-2021-01.rur-2021-01.r1 \(p. 1280\)](#) or higher 19c versions
- [Version 18.0.0.0.ru-2021-01.rur-2021-01.r1 \(p. 1322\)](#) or higher 18c versions
- [Version 12.2.0.1.ru-2021-01.rur-2021-01.r1 \(p. 1354\)](#) or higher 12.2.0.1 versions

### Topics

- [Setting parameters for advisor tasks \(p. 1112\)](#)
- [Disabling AUTO\\_STATS\\_ADVISOR\\_TASK \(p. 1113\)](#)
- [Re-enabling AUTO\\_STATS\\_ADVISOR\\_TASK \(p. 1113\)](#)

## Setting parameters for advisor tasks

To set parameters for some advisor tasks, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.advisor_task_set_parameter`. The `advisor_task_set_parameter` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_task_name</code>	varchar2	—	Yes	<p>The name of the advisor task whose parameters you want to change. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>AUTO_STATS_ADVISOR_TASK</code></li> <li>• <code>INDIVIDUAL_STATS_ADVISOR_TASK</code></li> <li>• <code>SYS_AUTO_SPM_EVOLVE_TASK</code></li> <li>• <code>SYS_AUTO_SQL_TUNING_TASK</code></li> </ul>
<code>p_parameter</code>	varchar2	—	Yes	<p>The name of the task parameter. To find valid parameters for an advisor task, run the following query. Substitute <code>p_task_name</code> with a valid value for <code>p_task_name</code>:</p> <pre>COL PARAMETER_NAME FORMAT a30 COL PARAMETER_VALUE FORMAT a30 SELECT PARAMETER_NAME, PARAMETER_VALUE FROM DBA_ADVISOR_PARAMETERS WHERE TASK_NAME='p_task_name' AND PARAMETER_VALUE != 'UNUSED' ORDER BY PARAMETER_NAME;</pre>
<code>p_value</code>	varchar2	—	Yes	<p>The value for a task parameter. To find valid values for task parameters, run the following query. Substitute <code>p_task_name</code> with a valid value for <code>p_task_name</code>:</p> <pre>COL PARAMETER_NAME FORMAT a30 COL PARAMETER_VALUE FORMAT a30 SELECT PARAMETER_NAME, PARAMETER_VALUE FROM DBA_ADVISOR_PARAMETERS WHERE TASK_NAME='p_task_name' AND PARAMETER_VALUE != 'UNUSED' ORDER BY PARAMETER_NAME;</pre>

The following PL/SQL program sets `ACCEPT_PLANS` to `FALSE` for `SYS_AUTO_SPM_EVOLVE_TASK`. The SQL Plan Management automated task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.

```
BEGIN
 rdsadmin.rdsadmin_util.advisor_task_set_parameter(
 p_task_name => 'SYS_AUTO_SPM_EVOLVE_TASK',
 p_parameter => 'ACCEPT_PLANS',
 p_value => 'FALSE');
END;
```

The following PL/SQL program sets `EXECUTION_DAYS_TO_EXPIRE` to 10 for `AUTO_STATS_ADVISOR_TASK`. The predefined task `AUTO_STATS_ADVISOR_TASK` runs automatically in the maintenance window once per day. The example sets the retention period for the task execution to 10 days.

```
BEGIN
 rdsadmin.rdsadmin_util.advisor_task_set_parameter(
 p_task_name => 'AUTO_STATS_ADVISOR_TASK',
 p_parameter => 'EXECUTION_DAYS_TO_EXPIRE',
 p_value => '10');
END;
```

## Disabling AUTO\_STATS\_ADVISOR\_TASK

To disable `AUTO_STATS_ADVISOR_TASK`, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.advisor_task_drop`. The `advisor_task_drop` procedure accepts the following parameter.

### Note

This procedure is available in Oracle Database 12c Release 2 (12.2.0.1) and later.

Parameter name	Data type	Default	Required	Description
<code>p_task_name</code>	<code>varchar2</code>	—	Yes	The name of the advisor task to be disabled. The only valid value is <code>AUTO_STATS_ADVISOR_TASK</code> .

The following command drops `AUTO_STATS_ADVISOR_TASK`.

```
EXEC rdsadmin.rdsadmin_util.advisor_task_drop('AUTO_STATS_ADVISOR_TASK')
```

You can re-enabling `AUTO_STATS_ADVISOR_TASK` using `rdsadmin.rdsadmin_util.dbms_stats_init`.

## Re-enabling AUTO\_STATS\_ADVISOR\_TASK

To re-enable `AUTO_STATS_ADVISOR_TASK`, use the Amazon RDS procedure `rdsadmin.rdsadmin_util.dbms_stats_init`. The `dbms_stats_init` procedure takes no parameters.

The following command re-enables `AUTO_STATS_ADVISOR_TASK`.

```
EXEC rdsadmin.rdsadmin_util.dbms_stats_init()
```

## Enabling HugePages for an Oracle DB instance

Amazon RDS for Oracle supports Linux kernel HugePages for increased database scalability. HugePages results in smaller page tables and less CPU time spent on memory management, increasing the performance of large database instances. For more information, see [Overview of HugePages](#) in the Oracle documentation.

You can use HugePages with the following versions and editions of Oracle Database:

- 19.0.0.0, all editions
- 18.0.0.0, all editions
- 12.2.0.1, all editions
- 12.1.0.2, all editions

The `use_large_pages` parameter controls whether HugePages are enabled for a DB instance. The possible settings for this parameter are `ONLY`, `FALSE`, and `{DBInstanceClassHugePagesDefault}`. The `use_large_pages` parameter is set to `{DBInstanceClassHugePagesDefault}` in the default DB parameter group for Oracle.

To control whether HugePages are enabled for a DB instance automatically, you can use the `DBInstanceClassHugePagesDefault` formula variable in parameter groups. The value is determined as follows:

- For the DB instance classes mentioned in the table following, `DBInstanceClassHugePagesDefault` always evaluates to `FALSE` by default, and `use_large_pages` evaluates to `FALSE`. You can enable HugePages manually for these DB instance classes if the DB instance class has at least 14 GiB of memory.
- For DB instance classes not mentioned in the table following, if the DB instance class has less than 14 GiB of memory, `DBInstanceClassHugePagesDefault` always evaluates to `FALSE`. Also, `use_large_pages` evaluates to `FALSE`.
- For DB instance classes not mentioned in the table following, if the instance class has at least 14 GiB of memory and less than 100 GiB of memory, `DBInstanceClassHugePagesDefault` evaluates to `TRUE` by default. Also, `use_large_pages` evaluates to `ONLY`. You can disable HugePages manually by setting `use_large_pages` to `FALSE`.
- For DB instance classes not mentioned in the table following, if the instance class has at least 100 GiB of memory, `DBInstanceClassHugePagesDefault` always evaluates to `TRUE`. Also, `use_large_pages` evaluates to `ONLY` and HugePages can't be disabled.

HugePages are not enabled by default for the following DB instance classes.

DB instance class family	DB instance classes with HugePages not enabled by default
db.m5	db.m5.large
db.m4	db.m4.large, db.m4.xlarge, db.m4.2xlarge, db.m4.4xlarge, db.m4.10xlarge
db.t3	db.t3.micro, db.t3.small, db.t3.medium, db.t3.large

For more information about DB instance classes, see [Hardware specifications for DB instance classes \(p. 33\)](#).

To enable HugePages for new or existing DB instances manually, set the `use_large_pages` parameter to `ONLY`. You can't use HugePages with Oracle Automatic Memory Management (AMM). If you set

the parameter `use_large_pages` to `ONLY`, then you must also set both `memory_target` and `memory_max_target` to 0. For more information about setting DB parameters for your DB instance, see [Working with DB parameter groups \(p. 229\)](#).

You can also set the `sga_target`, `sga_max_size`, and `pga_aggregate_target` parameters. When you set system global area (SGA) and program global area (PGA) memory parameters, add the values together. Subtract this total from your available instance memory (`DBInstanceClassMemory`) to determine the free memory beyond the HugePages allocation. You must leave free memory of at least 2 GiB, or 10 percent of the total available instance memory, whichever is smaller.

After you configure your parameters, you must reboot your DB instance for the changes to take effect. For more information, see [Rebooting a DB instance \(p. 277\)](#).

**Note**

The Oracle DB instance defers changes to SGA-related initialization parameters until you reboot the instance without failover. In the Amazon RDS console, choose **Reboot** but *do not* choose **Reboot with failover**.

In the AWS CLI, call the `reboot-db-instance` command with the `--no-force-failover` parameter. The DB instance does not process the SGA-related parameters during failover or during other maintenance operations that cause the instance to restart.

The following is a sample parameter configuration for HugePages that enables HugePages manually. You should set the values to meet your needs.

```
memory_target = 0
memory_max_target = 0
pga_aggregate_target = {DBInstanceClassMemory*1/8}
sga_target = {DBInstanceClassMemory*3/4}
sga_max_size = {DBInstanceClassMemory*3/4}
use_large_pages = ONLY
```

Assume the following parameters values are set in a parameter group.

```
memory_target = IF({DBInstanceClassHugePagesDefault}, 0,
{DBInstanceClassMemory*3/4})
memory_max_target = IF({DBInstanceClassHugePagesDefault}, 0,
{DBInstanceClassMemory*3/4})
pga_aggregate_target = IF({DBInstanceClassHugePagesDefault},
{DBInstanceClassMemory*1/8}, 0)
sga_target = IF({DBInstanceClassHugePagesDefault},
{DBInstanceClassMemory*3/4}, 0)
sga_max_size = IF({DBInstanceClassHugePagesDefault},
{DBInstanceClassMemory*3/4}, 0)
use_large_pages = {DBInstanceClassHugePagesDefault}
```

The parameter group is used by a db.r4 DB instance class with less than 100 GiB of memory. With these parameter settings and `use_large_pages` set to `{DBInstanceClassHugePagesDefault}`, HugePages are enabled on the db.r4 instance.

Consider another example with following parameters values set in a parameter group.

```
memory_target = IF({DBInstanceClassHugePagesDefault}, 0,
{DBInstanceClassMemory*3/4})
memory_max_target = IF({DBInstanceClassHugePagesDefault}, 0,
{DBInstanceClassMemory*3/4})
pga_aggregate_target = IF({DBInstanceClassHugePagesDefault},
{DBInstanceClassMemory*1/8}, 0)
sga_target = IF({DBInstanceClassHugePagesDefault},
{DBInstanceClassMemory*3/4}, 0)
```

```
sga_max_size = IF({DBInstanceClassHugePagesDefault},
 {DBInstanceClassMemory*3/4}, 0)
use_large_pages = FALSE
```

The parameter group is used by a db.r4 DB instance class and a db.r5 DB instance class, both with less than 100 GiB of memory. With these parameter settings, HugePages are disabled on the db.r4 and db.r5 instance.

**Note**

If this parameter group is used by a db.r4 DB instance class or db.r5 DB instance class with at least 100 GiB of memory, the `FALSE` setting for `use_large_pages` is overridden and set to `ONLY`. In this case, a customer notification regarding the override is sent.

After HugePages are active on your DB instance, you can view HugePages information by enabling enhanced monitoring. For more information, see [Monitoring OS metrics using Enhanced Monitoring \(p. 477\)](#).

## Enabling extended data types

Amazon RDS Oracle Database 12c supports extended data types. With extended data types, the maximum size is 32,767 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types. To use extended data types, set the `MAX_STRING_SIZE` parameter to `EXTENDED`. For more information, see [Extended data types](#) in the Oracle documentation.

If you don't want to use extended data types, keep the `MAX_STRING_SIZE` parameter set to `STANDARD` (the default). When this parameter is set to `STANDARD`, the size limits are 4,000 bytes for the `VARCHAR2` and `NVARCHAR2` data types, and 2,000 bytes for the `RAW` data type.

You can enable extended data types on a new or existing DB instance. For new DB instances, DB instance creation time is typically longer when you enable extended data types. For existing DB instances, the DB instance is unavailable during the conversion process.

The following are considerations for a DB instance with extended data types enabled:

- When you enable extended data types for a DB instance, you can't change the DB instance back to use the standard size for data types. After a DB instance is converted to use extended data types, if you set the `MAX_STRING_SIZE` parameter back to `STANDARD` it results in the `incompatible-parameters` status.
- When you restore a DB instance that uses extended data types, you must specify a parameter group with the `MAX_STRING_SIZE` parameter set to `EXTENDED`. During restore, if you specify the default parameter group or any other parameter group with `MAX_STRING_SIZE` set to `STANDARD` it results in the `incompatible-parameters` status.
- We recommend that you don't enable extended data types for Oracle DB instances running on the `t2.micro` DB instance class.

When the DB instance status is `incompatible-parameters` because of the `MAX_STRING_SIZE` setting, the DB instance remains unavailable until you set the `MAX_STRING_SIZE` parameter to `EXTENDED` and reboot the DB instance.

## Enabling extended data types for a new DB instance

### To enable extended data types for a new DB instance

1. Set the `MAX_STRING_SIZE` parameter to `EXTENDED` in a parameter group.

To set the parameter, you can either create a new parameter group or modify an existing parameter group.

For more information, see [Working with DB parameter groups \(p. 229\)](#).

2. Create a new Amazon RDS Oracle DB instance, and associate the parameter group with `MAX_STRING_SIZE` set to `EXTENDED` with the DB instance.

For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

## Enabling extended data types for an existing DB instance

When you modify a DB instance to enable extended data types, the data in the database is converted to use the extended sizes. The DB instance is unavailable during the conversion. The amount of time it takes to convert the data depends on the DB instance class used by the DB instance and the size of the database.

### Note

After you enable extended data types, you can't perform a point-in-time restore to a time during the conversion. You can restore to the time immediately before the conversion or after the conversion.

### To enable extended data types for an existing DB instance

1. Take a snapshot of the database.

If there are invalid objects in the database, Amazon RDS tries to recompile them. The conversion to extended data types can fail if Amazon RDS can't recompile an invalid object. The snapshot enables you to restore the database if there is a problem with the conversion. Always check for invalid objects before conversion and fix or drop those invalid objects. For production databases, we recommend testing the conversion process on a copy of your DB instance first.

For more information, see [Creating a DB snapshot \(p. 349\)](#).

2. Set the `MAX_STRING_SIZE` parameter to `EXTENDED` in a parameter group.

To set the parameter, you can either create a new parameter group or modify an existing parameter group.

For more information, see [Working with DB parameter groups \(p. 229\)](#).

3. Modify the DB instance to associate it with the parameter group with `MAX_STRING_SIZE` set to `EXTENDED`.

For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

4. Reboot the DB instance for the parameter change to take effect.

For more information, see [Rebooting a DB instance \(p. 277\)](#).

# Importing data into Oracle on Amazon RDS

How you import data into an Amazon RDS DB instance depends on the following:

- The amount of data you have
- The number of database objects in your database
- The variety of database objects in your database

For example, you can use Oracle SQL Developer to import a simple, 20 MB database. You can use Oracle Data Pump to import complex databases, or databases that are several hundred megabytes or several terabytes in size.

You can also use AWS Database Migration Service (AWS DMS) to import data into an Amazon RDS DB instance. AWS DMS can migrate databases without downtime. For many database engines, ongoing replication can continue until you are ready to switch over to the target database. You can migrate to Oracle from either the same database engine or a different database engine using AWS DMS. If you are migrating from a different database engine, you can use the AWS Schema Conversion Tool to migrate schema objects that are not migrated by AWS DMS. For more information about AWS DMS, see [What is AWS Database Migration Service](#).

Before you use any of these migration techniques, we recommend that you back up your database. After you import the data, you can back up your Amazon RDS DB instances by creating snapshots. Later, you can restore the snapshots. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

**Note**

You can also import data into Oracle using files from Amazon S3. For example, you can download Data Pump files from Amazon S3 to the DB instance host. For more information, see [Amazon S3 integration \(p. 1139\)](#).

## Importing using Oracle SQL Developer

For small databases, you can use Oracle SQL Developer, a graphical Java tool distributed without cost by Oracle. You can install this tool on your desktop computer (Windows, Linux, or Mac) or on one of your servers. Oracle SQL Developer provides options for migrating data between two Oracle databases, or for migrating data from other databases, such as MySQL, to Oracle. Oracle SQL Developer is best suited for migrating small databases. We recommend that you read the Oracle SQL Developer product documentation before you begin migrating your data.

After you install SQL Developer, you can use it to connect to your source and target databases. Use the **Database Copy** command on the Tools menu to copy your data to your Amazon RDS instance.

To download Oracle SQL Developer, go to <http://www.oracle.com/technetwork/developer-tools/sql-developer>.

Oracle also has documentation on how to migrate from other databases, including MySQL and SQL Server. For more information, see <http://www.oracle.com/technetwork/database/migration> in the Oracle documentation.

## Importing using Oracle Data Pump

Oracle Data Pump is a long-term replacement for the Oracle Export/Import utilities. Oracle Data Pump is the preferred way to move large amounts of data from an Oracle installation to an Amazon RDS DB instance. You can use Oracle Data Pump for several scenarios:

- Import data from an Oracle database (either on-premises or Amazon EC2 instance) to an Amazon RDS for Oracle DB instance.
- Import data from an RDS for Oracle DB instance to an Oracle database (either on-premises or Amazon EC2 instance).
- Import data between RDS for Oracle DB instances (for example, to migrate data from EC2-Classic to VPC).

To download Oracle Data Pump utilities, see [Oracle database software downloads](#) on the Oracle Technology Network website.

For compatibility considerations when migrating between versions of Oracle Database, see [the Oracle documentation](#).

When you import data with Oracle Data Pump, you must transfer the dump file that contains the data from the source database to the target database. You can transfer the dump file using an Amazon S3 bucket or by using a database link between the two databases.

When you use Oracle Data Pump to import data into an Oracle DB instance, we recommend the following best practices:

- Perform imports in `schema` or `table` mode to import specific schemas and objects.
- Limit the schemas you import to those required by your application.
- Don't import in `full` mode.

Because Amazon RDS for Oracle does not allow access to `SYS` or `SYSDBA` administrative users, importing in `full` mode, or importing schemas for Oracle-maintained components, might damage the Oracle data dictionary and affect the stability of your database.

- When loading large amounts of data, transfer the dump file to the target Amazon RDS for Oracle DB instance, take a DB snapshot of your instance, and then test the import to verify that it succeeds. If database components are invalidated, you can delete the DB instance and re-create it from the DB snapshot. The restored DB instance includes any dump files staged on the DB instance when you took the DB snapshot.
- Don't import dump files that were created using the Oracle Data Pump export parameters `TRANSPORT_TABLESPACES`, `TRANSPORTABLE`, or `TRANSPORT_FULL_CHECK`. Amazon RDS for Oracle DB instances don't support importing these dump files.
- Don't import dump files that contain Oracle Scheduler objects (jobs, programs, and schedules) in the schemas `SYS`, `SYSTEM`, `RDSADMIN`, `RDSSEC`, and `RDS_DATAGUARD`. Amazon RDS for Oracle DB instances do not support importing these dump files.

#### Note

To exclude unsupported Scheduler objects, use additional directives during the Data Pump export. If you use `DBMS_DATAPUMP`, add an additional `METADATA_FILTER` before the `DBMS_METADATA.START_JOB`:

```
DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'EXCLUDE_NAME_EXPR',
q'[IN (SELECT NAME FROM SYS.OBJ$
 WHERE TYPE# IN (66,67,74)
 AND OWNER# IN
 (SELECT USER# FROM SYS.USER$
 WHERE NAME IN ('RDSADMIN','SYS','SYSTEM','RDS_DATAGUARD','RDSSEC')
)
)]', 'PROCOBJ');
```

If you use `expdp`, create a parameter file that contains the exclude directive shown in the following example. Then use `PARFILE=parameter_file` with your `expdp` command.

```
exclude=procobj:"IN
 (SELECT NAME FROM sys.OBJ$
 WHERE TYPE# IN (66,67,74)
 AND OWNER# IN
 (SELECT USER# FROM SYS.USER$
 WHERE NAME IN ('RDSADMIN', 'SYS', 'SYSTEM', 'RDS_DATAGUARD', 'RDSSEC')
)
)"
```

The examples in this section show one way to import data into an Oracle database. However, Oracle Data Pump permits many ways to import data. To learn more about Oracle Data Pump, see [the Oracle documentation](#).

The examples in this section use the `DBMS_DATAPUMP` package. The same tasks can be accomplished by using the Oracle Data Pump command line utilities `impdp` and `expdp`. You can install these utilities on a remote host as part of an Oracle Client installation, including Oracle Instant Client.

### Topics

- [Importing data with Oracle Data Pump and an Amazon S3 bucket \(p. 1120\)](#)
- [Importing data with Oracle Data Pump and a database link \(p. 1123\)](#)

## Importing data with Oracle Data Pump and an Amazon S3 bucket

The following import process uses Oracle Data Pump and an Amazon S3 bucket. The process exports data on the source database using the Oracle `DBMS_DATAPUMP` package and puts the dump file in an Amazon S3 bucket. It then downloads the dump file from the Amazon S3 bucket to the `DATA_PUMP_DIR` directory on the target Amazon RDS for Oracle DB instance. The final step imports the data from the copied dump file into the Amazon RDS for Oracle DB instance using the package `DBMS_DATAPUMP`.

The process has the following requirements:

- You must have an Amazon S3 bucket available for file transfers, and the Amazon S3 bucket must be in the same AWS Region as the DB instance. For instructions, see [Create a bucket](#) in the *Amazon Simple Storage Service Getting Started Guide*.
- The object that you upload into the Amazon S3 bucket must be 5 TB or less. For more information about working with objects in Amazon S3, see [Amazon Simple Storage Service Developer Guide](#).

### Note

If you dump file exceeds 5 TB, you can run the Oracle Data Pump export with the `parallel` option. This operation spreads the data into multiple dump files so that you do not exceed the 5 TB limit for individual files.

- You must prepare the Amazon S3 bucket for Amazon RDS integration by following the instructions in [Prerequisites for Amazon RDS for Oracle integration with Amazon S3 \(p. 1139\)](#).
- You must ensure that you have enough storage space to store the dump file on the source instance and the target DB instance.

### Note

This process imports a dump file into the `DATA_PUMP_DIR` directory, a preconfigured directory on all Oracle DB instances. This directory is located on the same storage volume as your data files. When you import the dump file, the existing Oracle data files use more space. Thus, you should make sure that your DB instance can accommodate that additional use of space. The imported dump file is not automatically deleted or purged from the `DATA_PUMP_DIR` directory. To remove the imported dump file, use `UTL_FILE.FREMOVE`, found on the Oracle website.

The import process using Oracle Data Pump and an Amazon S3 bucket has the following steps.

#### Topics

- [Step 1: Grant privileges to the user on the Amazon RDS target instance \(p. 1121\)](#)
- [Step 2: Use DBMS\\_DATAPUMP to create a dump file \(p. 1121\)](#)
- [Step 3: Upload the dump file to your Amazon S3 bucket \(p. 1122\)](#)
- [Step 4: Copy the exported dump file from the Amazon S3 bucket to the target DB instance \(p. 1122\)](#)
- [Step 5: Use DBMS\\_DATAPUMP to import the data file on the target DB instance \(p. 1122\)](#)
- [Step 6: Clean up \(p. 1123\)](#)

## Step 1: Grant privileges to the user on the Amazon RDS target instance

To grant privileges to the user on the RDS target instance, take the following steps:

1. Use SQL Plus or Oracle SQL Developer to connect to the Amazon RDS target Oracle DB instance into which the data will be imported. Connect as the Amazon RDS master user. For information about connecting to the DB instance, see [Connecting to your Oracle DB instance \(p. 1013\)](#).
2. Create the required tablespaces before you import the data. For more information, see [Creating and sizing tablespaces \(p. 1062\)](#).
3. If the user account into which the data is imported doesn't exist, create the user account and grant the necessary permissions and roles. If you plan to import data into multiple user schemas, create each user account and grant the necessary privileges and roles to it.

For example, the following commands create a new user and grant the necessary permissions and roles to import the data into the user's schema.

```
CREATE USER schema_1 IDENTIFIED BY <password>;
GRANT CREATE SESSION, RESOURCE TO schema_1;
ALTER USER schema_1 QUOTA 100M ON users;
```

This example grants the new user the CREATE SESSION privilege and the RESOURCE role. Additional privileges and roles might be required depending on the database objects that you import.

#### Note

Replace *schema\_1* with the name of your schema in this step and in the following steps.

## Step 2: Use DBMS\_DATAPUMP to create a dump file

Use SQL Plus or Oracle SQL Developer to connect to the source Oracle instance with an administrative user. If the source database is an Amazon RDS for Oracle DB instance, connect with the Amazon RDS master user. Next, use the Oracle Data Pump utility to create a dump file.

The following script creates a dump file named *sample.dmp* in the `DATA_PUMP_DIR` directory that contains the *SCHEMA\_1* schema. Replace *SCHEMA\_1* with the name of the schema that you want to export.

```
DECLARE
 v_hdnl NUMBER;
BEGIN
 v_hdnl := DBMS_DATAPUMP.OPEN(operation => 'EXPORT', job_mode => 'SCHEMA',
 job_name=>null);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample.dmp',
 directory => 'DATA_PUMP_DIR',
```

```

filetype => dbms_datapump.ku$_file_type_dump_file);
DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_exp.log',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_log_file);
DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'SCHEMA_EXPR','IN (''SCHEMA_1''));
DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'EXCLUDE_NAME_EXPR',
 q'[IN (SELECT NAME FROM sys.OBJ$ WHERE TYPE# IN (66,67,74) AND OWNER# IN
 (SELECT USER# FROM SYS.USER$ WHERE NAME IN
 ('RDSADMIN','SYS','SYSTEM','RDS_DATAGUARD','RDSSEC')))]','PROCOBJ');
DBMS_DATAPUMP.START_JOB(v_hdnl);
END;
/

```

**Note**

Data Pump jobs are started asynchronously. For information about monitoring a Data Pump job, see [Monitoring job status](#) in the Oracle documentation. You can view the contents of the export log by using the `rdsadmin.rds_file_util.read_text_file` procedure. For more information, see [Reading files in a DB instance directory \(p. 1109\)](#).

### Step 3: Upload the dump file to your Amazon S3 bucket

Upload the dump file to the Amazon S3 bucket.

Use the Amazon RDS procedure `rdsadmin.rdsadmin_s3_tasks.upload_to_s3` to copy the dump file to the Amazon S3 bucket. The following example uploads all of the files from the `DATA_PUMP_DIR` directory to an Amazon S3 bucket named `mys3bucket`.

```

SELECT rdsadmin.rdsadmin_s3_tasks.upload_to_s3(
 p_bucket_name => 'mys3bucket',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;

```

The SELECT statement returns the ID of the task in a VARCHAR2 data type.

For more information, see [Uploading files from an Oracle DB instance to an Amazon S3 bucket \(p. 1146\)](#).

### Step 4: Copy the exported dump file from the Amazon S3 bucket to the target DB instance

Use SQL Plus or Oracle SQL Developer to connect to the Amazon RDS target Oracle DB instance. Next, use the Amazon RDS procedure `rdsadmin.rdsadmin_s3_tasks.download_from_s3` to copy the dump file from the Amazon S3 bucket to the target DB instance. The following example downloads all of the files from an Amazon S3 bucket named `mys3bucket` to the `DATA_PUMP_DIR` directory.

```

SELECT rdsadmin.rdsadmin_s3_tasks.download_from_s3(
 p_bucket_name => 'mys3bucket',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;

```

The SELECT statement returns the ID of the task in a VARCHAR2 data type.

For more information, see [Downloading files from an Amazon S3 bucket to an Oracle DB instance \(p. 1148\)](#).

### Step 5: Use DBMS\_DATAPUMP to import the data file on the target DB instance

Use Oracle Data Pump to import the schema in the DB instance. Additional options such as `METADATA_REMAP` might be required.

Connect to the DB instance with the Amazon RDS master user account to perform the import.

```
DECLARE
 v_hdnl NUMBER;
BEGIN
 v_hdnl := DBMS_DATAPUMP.OPEN(
 operation => 'IMPORT',
 job_mode => 'SCHEMA',
 job_name => null);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_copied.dmp',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_dump_file);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_imp.log',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_log_file);
 DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'SCHEMA_EXPR','IN (''SCHEMA_1''));
 DBMS_DATAPUMP.START_JOB(v_hdnl);
END;
/
```

#### Note

Data Pump jobs are started asynchronously. For information about monitoring a Data Pump job, see [Monitoring job status](#) in the Oracle documentation. You can view the contents of the import log by using the `rdsadmin.rds_file_util.read_text_file` procedure. For more information, see [Reading files in a DB instance directory \(p. 1109\)](#).

You can verify the data import by viewing the user's tables on the DB instance. For example, the following query returns the number of tables for `SCHEMA_1`.

```
SELECT COUNT(*) FROM DBA_TABLES WHERE OWNER='SCHEMA_1';
```

## Step 6: Clean up

After the data has been imported, you can delete the files that you don't want to keep. You can list the files in the `DATA_PUMP_DIR` using the following command.

```
SELECT * FROM TABLE(rdsadmin.rds_file_util.listdir('DATA_PUMP_DIR')) ORDER BY MTIME;
```

To delete files in the `DATA_PUMP_DIR` that you no longer require, use the following command.

```
EXEC UTL_FILE.FREMOVE('DATA_PUMP_DIR','<file name>');
```

For example, the following command deletes the file named "sample\_copied.dmp".

```
EXEC UTL_FILE.FREMOVE('DATA_PUMP_DIR','sample_copied.dmp');
```

## Importing data with Oracle Data Pump and a database link

The following import process uses Oracle Data Pump and the Oracle `DBMS_FILE_TRANSFER` package. The process connects to a source Oracle instance, which can be an on-premises or Amazon EC2 instance, or an Amazon RDS for Oracle DB instance. The process then exports data using the `DBMS_DATAPUMP` package. Next, it uses the `DBMS_FILE_TRANSFER.PUT_FILE` method to copy the dump file from the Oracle instance to the `DATA_PUMP_DIR` directory on the target Amazon RDS for Oracle DB instance that

is connected using a database link. The final step imports the data from the copied dump file into the Amazon RDS for Oracle DB instance using the `DBMS_DATAPUMP` package.

The process has the following requirements:

- You must have execute privileges on the `DBMS_FILE_TRANSFER` and `DBMS_DATAPUMP` packages.
- You must have write privileges to the `DATA_PUMP_DIR` directory on the source DB instance.
- You must ensure that you have enough storage space to store the dump file on the source instance and the target DB instance.

**Note**

This process imports a dump file into the `DATA_PUMP_DIR` directory, a preconfigured directory on all Oracle DB instances. This directory is located on the same storage volume as your data files. When you import the dump file, the existing Oracle data files use more space. Thus, you should make sure that your DB instance can accommodate that additional use of space. The imported dump file is not automatically deleted or purged from the `DATA_PUMP_DIR` directory. To remove the imported dump file, use [UTL\\_FILE.FREMOVE](#), found on the Oracle website.

The import process using Oracle Data Pump and the `DBMS_FILE_TRANSFER` package has the following steps.

**Topics**

- [Step 1: Grant privileges to the user on the Amazon RDS target instance \(p. 1124\)](#)
- [Step 2: Grant privileges to the user on the source database \(p. 1125\)](#)
- [Step 3: Use DBMS\\_DATAPUMP to create a dump file \(p. 1125\)](#)
- [Step 4: Create a database link to the target DB instance \(p. 1126\)](#)
- [Step 5: Use DBMS\\_FILE\\_TRANSFER to copy the exported dump file to the target DB instance \(p. 1126\)](#)
- [Step 6: Use DBMS\\_DATAPUMP to import the data file to the target DB instance \(p. 1126\)](#)
- [Step 7: Clean up \(p. 1127\)](#)

## Step 1: Grant privileges to the user on the Amazon RDS target instance

To grant privileges to the user on the RDS target instance, take the following steps:

1. Use SQL Plus or Oracle SQL Developer to connect to the Amazon RDS target Oracle DB instance into which the data will be imported. Connect as the Amazon RDS master user. For information about connecting to the DB instance, see [Connecting to your Oracle DB instance \(p. 1013\)](#).
2. Create the required tablespaces before you import the data. For more information, see [Creating and sizing tablespaces \(p. 1062\)](#).
3. If the user account into which the data is imported doesn't exist, create the user account and grant the necessary permissions and roles. If you plan to import data into multiple user schemas, create each user account and grant the necessary privileges and roles to it.

For example, the following commands create a new user and grant the necessary permissions and roles to import the data into the user's schema.

```
CREATE USER schema_1 IDENTIFIED BY <password>;
GRANT CREATE SESSION, RESOURCE TO schema_1;
ALTER USER schema_1 QUOTA 100M ON users;
```

This example grants the new user the `CREATE SESSION` privilege and the `RESOURCE` role. Additional privileges and roles might be required depending on the database objects that you import.

**Note**

Replace *schema\_1* with the name of your schema in this step and in the following steps.

## Step 2: Grant privileges to the user on the source database

Use SQL\*Plus or Oracle SQL Developer to connect to the Oracle instance that contains the data to be imported. If necessary, create a user account and grant the necessary permissions.

**Note**

If the source database is an Amazon RDS instance, you can skip this step. You use your Amazon RDS master user account to perform the export.

The following commands create a new user and grant the necessary permissions.

```
CREATE USER export_user IDENTIFIED BY <password>;
GRANT CREATE SESSION, CREATE TABLE, CREATE DATABASE LINK TO export_user;
ALTER USER export_user QUOTA 100M ON users;
GRANT READ, WRITE ON DIRECTORY data_pump_dir TO export_user;
GRANT SELECT_CATALOG_ROLE TO export_user;
GRANT EXECUTE ON DBMS_DATAPUMP TO export_user;
GRANT EXECUTE ON DBMS_FILE_TRANSFER TO export_user;
```

## Step 3: Use DBMS\_DATAPUMP to create a dump file

Use SQL Plus or Oracle SQL Developer to connect to the source Oracle instance with an administrative user or with the user you created in step 2. If the source database is an Amazon RDS for Oracle DB instance, connect with the Amazon RDS master user. Next, use the Oracle Data Pump utility to create a dump file.

The following script creates a dump file named *sample.dmp* in the *DATA\_PUMP\_DIR* directory.

```
DECLARE
 v_hdnl NUMBER;
BEGIN
 v_hdnl := DBMS_DATAPUMP.OPEN(
 operation => 'EXPORT',
 job_mode => 'SCHEMA',
 job_name => null);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample.dmp',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_dump_file);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_exp.log',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_log_file);
 DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'SCHEMA_EXPR','IN (''SCHEMA_1''));
 DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'EXCLUDE_NAME_EXPR',
 q'[IN (SELECT NAME FROM sys.OBJ$ WHERE TYPE# IN (66,67,74) AND OWNER# IN
 (SELECT USER# FROM SYS.USER$ WHERE NAME IN
 ('RDSADMIN','SYS','SYSTEM','RDS_DATAGUARD','RDSSEC')))]','PROCOBJ');
 DBMS_DATAPUMP.START_JOB(v_hdnl);
END;
/
```

**Note**

Data Pump jobs are started asynchronously. For information about monitoring a Data Pump job, see [Monitoring job status](#) in the Oracle documentation. You can view the contents of the

export log by using the `rdsadmin.rds_file_util.read_text_file` procedure. For more information, see [Reading files in a DB instance directory \(p. 1109\)](#).

## Step 4: Create a database link to the target DB instance

Create a database link between your source instance and your target DB instance. Your local Oracle instance must have network connectivity to the DB instance in order to create a database link and to transfer your export dump file.

Perform this step connected with the same user account as the previous step.

If you are creating a database link between two DB instances inside the same VPC or peered VPCs, the two DB instances should have a valid route between them. The security group of each DB instance must allow ingress to and egress from the other DB instance. The security group inbound and outbound rules can refer to security groups from the same VPC or a peered VPC. For more information, see [Adjusting database links for use with DB instances in a VPC \(p. 1069\)](#).

The following command creates a database link named `to_rds` that connects to the Amazon RDS master user at the target DB instance.

```
CREATE DATABASE LINK to_rds
 CONNECT TO <master_user_account> IDENTIFIED BY <password>
 USING '(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=<dns or ip address of remote db>)
 (PORT=<listener port>))(CONNECT_DATA=(SID=<remote SID>)));'
```

## Step 5: Use DBMS\_FILE\_TRANSFER to copy the exported dump file to the target DB instance

Use `DBMS_FILE_TRANSFER` to copy the dump file from the source database instance to the target DB instance. The following script copies a dump file named `sample.dmp` from the source instance to a target database link named `to_rds` (created in the previous step).

```
BEGIN
 DBMS_FILE_TRANSFER.PUT_FILE(
 source_directory_object => 'DATA_PUMP_DIR',
 source_file_name => 'sample.dmp',
 destination_directory_object => 'DATA_PUMP_DIR',
 destination_file_name => 'sample_copied.dmp',
 destination_database => 'to_rds');
END;
/
```

## Step 6: Use DBMS\_DATAPUMP to import the data file to the target DB instance

Use Oracle Data Pump to import the schema in the DB instance. Additional options such as `METADATA_REMAP` might be required.

Connect to the DB instance with the Amazon RDS master user account to perform the import.

```
DECLARE
 v_hdnl NUMBER;
BEGIN
 v_hdnl := DBMS_DATAPUMP.OPEN(
 operation => 'IMPORT',
 job_mode => 'SCHEMA',
 job_name => null);
 DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_copied.dmp',
```

```
directory => 'DATA_PUMP_DIR',
filetype => dbms_datapump.ku$_file_type_dump_file);
DBMS_DATAPUMP.ADD_FILE(
 handle => v_hdnl,
 filename => 'sample_imp.log',
 directory => 'DATA_PUMP_DIR',
 filetype => dbms_datapump.ku$_file_type_log_file);
DBMS_DATAPUMP.METADATA_FILTER(v_hdnl,'SCHEMA_EXPR','IN (''SCHEMA_1''));
DBMS_DATAPUMP.START_JOB(v_hdnl);
END;
/
```

#### Note

Data Pump jobs are started asynchronously. For information about monitoring a Data Pump job, see [Monitoring job status](#) in the Oracle documentation. You can view the contents of the import log by using the `rdsadmin.rds_file_util.read_text_file` procedure. For more information, see [Reading files in a DB instance directory \(p. 1109\)](#).

You can verify the data import by viewing the user's tables on the DB instance. For example, the following query returns the number of tables for `SCHEMA_1`.

```
SELECT COUNT(*) FROM DBA_TABLES WHERE OWNER='SCHEMA_1';
```

#### Step 7: Clean up

After the data has been imported, you can delete the files that you don't want to keep. You can list the files in `DATA_PUMP_DIR` using the following command.

```
SELECT * FROM TABLE(rdsadmin.rds_file_util.listdir('DATA_PUMP_DIR')) ORDER BY MTIME;
```

To delete files in `DATA_PUMP_DIR` that you no longer require, use the following command.

```
EXEC UTL_FILE.FREMOVE('DATA_PUMP_DIR','<file name>');
```

For example, the following command deletes the file named "sample\_copied.dmp".

```
EXEC UTL_FILE.FREMOVE('DATA_PUMP_DIR','sample_copied.dmp');
```

## Oracle Export/Import utilities

The Oracle Export/Import utilities are best suited for migrations where the data size is small and data types such as binary float and double are not required. The import process creates the schema objects so you do not need to run a script to create them beforehand, making this process well suited for databases with small tables. The following example demonstrates how these utilities can be used to export and import specific tables.

To download Oracle export and import utilities, go to <http://www.oracle.com/technetwork/database/enterprise-edition/downloads/index.html>.

Export the tables from the source database using the command below. Substitute `username/password` as appropriate.

```
exp cust_dba@ORCL FILE=exp_file.dmp TABLES=(tab1,tab2,tab3) LOG=exp_file.log
```

The export process creates a binary dump file that contains both the schema and data for the specified tables. Now this schema and data can be imported into a target database using the command:

```
imp cust_dba@targetdb FROMUSER=cust_schema TOUSER=cust_schema \
TABLES=(tab1,tab2,tab3) FILE=exp_file.dmp LOG=imp_file.log
```

There are other variations of the Export and Import commands that might be better suited to your needs. See Oracle's documentation for full details.

## Oracle SQL\*Loader

Oracle SQL\*Loader is well suited for large databases that have a limited number of objects in them. Since the process involved in exporting from a source database and loading to a target database is very specific to the schema, the following example creates the sample schema objects, exports from a source, and then loads it into a target database.

To download Oracle SQL\*Loader, go to <http://www.oracle.com/technetwork/database/enterprise-edition/downloads/index.html>.

1. Create a sample source table using the command below.

```
CREATE TABLE customer_0 TABLESPACE users
AS (SELECT ROWNUM id, o.*
 FROM ALL_OBJECTS o, ALL_OBJECTS x
 WHERE ROWNUM <= 1000000);
```

2. On the target Amazon RDS instance, create a destination table that is used to load the data. The clause WHERE 1=2 ensures that you copy the structure of ALL\_OBJECTS, but don't copy any of the rows.

```
CREATE TABLE customer_1 TABLESPACE users
AS (SELECT 0 AS ID, OWNER, OBJECT_NAME, CREATED
 FROM ALL_OBJECTS
 WHERE 1=2);
```

3. The data is exported from the source database to a flat file with delimiters. This example uses SQL\*Plus for this purpose. For your data, you will likely need to generate a script that does the export for all the objects in the database.

```
ALTER SESSION SET NLS_DATE_FORMAT = 'YYYY/MM/DD HH24:MI:SS'

SET LINESIZE 800 HEADING OFF FEEDBACK OFF ARRAY 5000 PAGESIZE 0
SPOOL customer_0.out
SET MARKUP HTML PREFORMAT ON
SET COLSEP ','

SELECT id, owner, object_name, created
FROM customer_0;

SPOOL OFF
```

4. You need to create a control file to describe the data. Again, depending on your data, you need to build a script that does this step.

```
cat << EOF > sqlldr_1.ctl
load data
infile customer_0.out
into table customer_1
APPEND
fields terminated by "," optionally enclosed by ''
(
 id POSITION(01:10) INTEGER EXTERNAL,
```

```

 owner POSITION(12:41) CHAR,
 object_name POSITION(43:72) CHAR,
 created POSITION(74:92) date "YYYY/MM/DD HH24:MI:SS"
)

```

If needed, copy the files generated by the preceding code to a staging area, such as an Amazon EC2 instance.

5. Finally, import the data using SQL\*Loader with the appropriate username and password for the target database.

```
sqlldr cust_dba@targetdb CONTROL=sqlldr_1.ctl BINDSIZE=10485760 READSIZE=10485760
ROWS=1000
```

## Oracle materialized views

You can also make use of Oracle materialized view replication to migrate large datasets efficiently. Replication allows you to keep the target tables in sync with the source on an ongoing basis, so the actual cutover to Amazon RDS can be done later, if needed. The replication is set up using a database link from the Amazon RDS instance to the source database.

One requirement for materialized views is to allow access from the target database to the source database. In the following example, access rules were enabled on the source database to allow the Amazon RDS target database to connect to the source over SQLNet.

1. Create a user account on both source and Amazon RDS target instances that can authenticate with the same password.

```

CREATE USER dblink_user IDENTIFIED BY <password>
 DEFAULT TABLESPACE users
 TEMPORARY TABLESPACE temp;

GRANT CREATE SESSION TO dblink_user;

GRANT SELECT ANY TABLE TO dblink_user;

GRANT SELECT ANY DICTIONARY TO dblink_user;

```

2. Create a database link from the Amazon RDS target instance to the source instance using the newly created dblink\_user.

```

CREATE DATABASE LINK remote_site
 CONNECT TO dblink_user IDENTIFIED BY <password>
 USING '(description=(address=(protocol=tcp) (host=<myhost>)
 (port=<listener port>)) (connect_data=(sid=<sourcedb sid>)))';

```

3. Test the link:

```
SELECT * FROM V$INSTANCE@remote_site;
```

4. Create a sample table with primary key and materialized view log on the source instance.

```

CREATE TABLE customer_0 TABLESPACE users
 AS (SELECT ROWNUM id, o./*
 FROM ALL_OBJECTS o, ALL_OBJECTS x
 WHERE ROWNUM <= 1000000);

ALTER TABLE customer_0 ADD CONSTRAINT pk_customer_0 PRIMARY KEY (id) USING INDEX;

```

```
CREATE MATERIALIZED VIEW LOG ON customer_0;
```

5. On the target Amazon RDS instance, create a materialized view.

```
CREATE MATERIALIZED VIEW customer_0
 BUILD IMMEDIATE REFRESH FAST
 AS (SELECT *
 FROM cust_dba.customer_0@remote_site);
```

6. On the target Amazon RDS instance, refresh the materialized view.

```
EXEC DBMS_MV.REFRESH('CUSTOMER_0', 'f');
```

7. Drop the materialized view and include the PRESERVE TABLE clause to retain the materialized view container table and its contents.

```
DROP MATERIALIZED VIEW customer_0 PRESERVE TABLE;
```

The retained table has the same name as the dropped materialized view.

# Working with Oracle replicas for Amazon RDS

To configure replication between Oracle DB instances, you can create replica databases.

## Topics

- [Overview of Oracle replicas \(p. 1131\)](#)
- [Replica requirements for Oracle \(p. 1131\)](#)
- [Preparing to create an Oracle replica \(p. 1133\)](#)
- [Creating an Oracle replica in mounted mode \(p. 1134\)](#)
- [Modifying the Oracle replica mode \(p. 1135\)](#)
- [Troubleshooting Oracle replicas \(p. 1136\)](#)

## Overview of Oracle replicas

An Oracle *replica* database is either mounted or read-only. An Oracle replica in read-only mode is called a *read replica*. An Oracle replica in mounted mode is called a *mounted replica*.

## Read-only and mounted replicas

When creating or modifying an Oracle replica, you can place it in either of the following modes:

- Read-only. This is the default. Active Data Guard transmits and applies changes from the source database to all read replica databases.

You can create up to five read replicas from one source DB instance. For general information about read replicas that applies to all DB engines, see [Working with read replicas \(p. 279\)](#). For information about Oracle Data Guard, see [Oracle data guard concepts and administration](#) in the Oracle documentation.

- Mounted. In this case, replication uses Oracle Data Guard, but the replica database doesn't accept user connections. The primary use for mounted replicas is cross-Region disaster recovery.

A mounted replica can't serve a read-only workload. The mounted replica deletes archived redo log files after it applies them, regardless of the archived log retention policy.

You can create a combination of mounted and read-only DB replicas for the same source DB instance. You can change a read-only replica to mounted mode, or change a mounted replica to read-only mode. In either case, the Oracle database preserves the archived log retention setting.

## Outages during replication

When you create an Oracle replica, no outage occurs for the source DB instance. Amazon RDS takes a snapshot of the source DB instance. This snapshot becomes the replica. Amazon RDS sets the necessary parameters and permissions for the source DB and replica without service interruption. Similarly, if you delete a replica, no outage occurs.

## Replica requirements for Oracle

Before creating an Oracle replica, check the following requirements.

## Version and licensing requirements for Oracle replicas

Before creating an Oracle replica, check the version and licensing requirements:

- If the replica is in read-only mode, make sure that you have an Active Data Guard license. If you place the replica in mounted mode, you don't need an Active Data Guard license. Only the Oracle DB engine supports mounted replicas.
- Oracle replicas are only available on the Oracle Enterprise Edition (EE) engine.
- Oracle replicas are available for Oracle version 12.1.0.2.v10 and higher 12.1 versions, for all 12.2 versions, for all 18c versions, and for all 19c versions.
- Oracle replicas are available for DB instances only on the EC2-VPC platform.
- Oracle replicas are available for DB instances running only on DB instance classes with two or more vCPUs. A source DB instance can't use the db.t3.micro instance class.
- The Oracle DB engine version of the source DB instance and all of its replicas must be the same. Amazon RDS upgrades the replicas immediately after upgrading the source DB instance, regardless of a replica's maintenance window. For major version upgrades of cross-Region replicas, Amazon RDS automatically does the following:
  - Generates an option group for the target version.
  - Copies all options and option settings from the original option group to the new option group.
  - Associates the upgraded cross-Region replica with the new option group.

For more information about upgrading the DB engine version, see [Upgrading the Oracle DB engine \(p. 1221\)](#).

## Option requirements for Oracle replicas

Before creating a replica for Oracle, check the requirements for option groups:

- If your Oracle replica is in the same AWS Region as its source DB instance, make sure that it belongs to the same option group as the source DB instance. Modifications to the source option group or source option group membership propagate to replicas. These changes are applied to the replicas immediately after they are applied to the source DB instance, regardless of the replica's maintenance window.

For more information about option groups, see [Working with option groups \(p. 213\)](#).

- When you create an Oracle cross-Region replica, Amazon RDS creates a dedicated option group for it.

You can't remove an Oracle cross-Region replica from its dedicated option group. No other DB instances can use the dedicated option group for an Oracle cross-Region replica.

You can only add or remove the following nonreplicated options from a dedicated option group:

- NATIVE\_NETWORK\_ENCRYPTION
- OEM
- OEM\_AGENT
- SSL

To add other options to an Oracle cross-Region replica, add them to the source DB instance's option group. The option is also installed on all of the source DB instance's replicas. For licensed options, make sure that there are sufficient licenses for the replicas.

When you promote an Oracle cross-Region replica, the promoted replica behaves the same as other Oracle DB instances, including the management of its options. You can promote a replica explicitly or implicitly by deleting its source DB instance.

For more information about option groups, see [Working with option groups \(p. 213\)](#).

## Miscellaneous requirements for Oracle replicas

Before creating an Oracle replica, check the following miscellaneous requirements:

- If a DB instance is a source for one or more cross-Region replicas, the source DB retains its archived redo logs until they are applied on all cross-Region replicas. The archived redo logs might result in increased storage consumption.
- A logon trigger on a primary instance must permit access to the `RDS_DATAGUARD` user and to any user whose `AUTHENTICATED_IDENTITY` value is `RDS_DATAGUARD` or `rdsdb`. Also, the trigger must not set the current schema for the `RDS_DATAGUARD` user.
- To avoid disrupting RDS automation, system triggers must permit specific users to log on to the primary and replica database. [System triggers](#) include DDL, logon, and database role triggers. We recommend that you add code to your triggers to exclude the users listed in the following sample code:

```
-- Determine who the user is
SELECT SYS_CONTEXT('USERENV','AUTENTICATED_IDENTITY') INTO CURRENT_USER FROM DUAL;
-- The following users should always be able to login to either the Primary or Replica
IF CURRENT_USER IN ('master_user', 'SYS', 'SYSTEM', 'RDS_DATAGUARD', 'rdsdb') THEN
 RETURN;
END IF;
```

- To avoid blocking connections from the Data Guard broker process, don't enable restricted sessions. For more information about restricted sessions, see [Enabling and disabling restricted sessions \(p. 1050\)](#).
- Block change tracking is supported for read-only replicas, but not for mounted replicas. You can change a mounted replica to a read-only replica, and then enable block change tracking. For more information, see [Enabling and disabling block change tracking \(p. 1088\)](#).

## Preparing to create an Oracle replica

Before you can begin using your replica, perform the following tasks.

### Topics

- [Enabling automatic backups \(p. 1133\)](#)
- [Enabling force logging mode \(p. 1133\)](#)
- [Changing your logging configuration \(p. 1134\)](#)
- [Setting the `MAX\_STRING\_SIZE` parameter \(p. 1134\)](#)
- [Planning compute and storage resources \(p. 1134\)](#)

## Enabling automatic backups

Before a DB instance can serve as a source DB instance, make sure to enable automatic backups on the source DB instance. To learn how to perform this procedure, see [Enabling automated backups \(p. 332\)](#).

## Enabling force logging mode

We recommend that you enable force logging mode. In force logging mode, the Oracle database writes redo records even when `NOLOGGING` is used with data definition language (DDL) statements.

### To enable force logging mode

1. Log in to your Oracle database using a client tool such as SQL Developer.

2. Enable force logging mode by running the following procedure.

```
exec rdsadmin.rdsadmin_util.force_logging(p_enable => true);
```

For more information about this procedure, see [Setting force logging \(p. 1075\)](#).

## Changing your logging configuration

If you want to change your logging configuration, we recommend that you complete the changes before making a DB instance the source for replicas. Also, we recommend that you not modify the logging configuration after you create the replicas. Modifications can cause the online redo logging configuration to get out of sync with the standby logging configuration.

Modify the logging configuration for a DB instance by using the Amazon RDS procedures `rdsadmin.rdsadmin_util.add_logfile` and `rdsadmin.rdsadmin_util.drop_logfile`. For more information, see [Adding online redo logs \(p. 1076\)](#) and [Dropping online redo logs \(p. 1077\)](#).

## Setting the MAX\_STRING\_SIZE parameter

Before you create an Oracle replica, ensure that the setting of the `MAX_STRING_SIZE` parameter is the same on the source DB instance and the replica. You can do this by associating them with the same parameter group. If you have different parameter groups for the source and the replica, you can set `MAX_STRING_SIZE` to the same value. For more information about setting this parameter, see [Enabling extended data types for a new DB instance \(p. 1116\)](#).

## Planning compute and storage resources

Ensure that the source DB instance and its replicas are sized properly, in terms of compute and storage, to suit their operational load. If a replica reaches compute, network, or storage resource capacity, the replica stops receiving or applying changes from its source. Amazon RDS for Oracle doesn't intervene to mitigate high replica lag between a source DB instance and its replicas. You can modify the storage and CPU resources of a replica independently from its source and other replicas.

## Creating an Oracle replica in mounted mode

By default, Oracle replicas are read-only. To create a replica in mounted mode, use the console, the AWS CLI, or the RDS API.

### Console

#### To create a mounted replica from a source Oracle DB instance

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.
3. Choose the Oracle DB instance that you want to use as the source for a mounted replica.
4. For **Actions**, choose **Create replica**.
5. For **Replica mode**, choose **Mounted**.
6. Choose the settings that you want to use. For **DB instance identifier**, enter a name for the read replica. Adjust other settings as needed.
7. For **Regions**, choose the Region where the mounted replica will be launched.
8. Choose your instance size and storage type. We recommend that you use the same DB instance class and storage type as the source DB instance for the read replica.

9. For **Multi-AZ deployment**, choose **Create a standby instance** to create a standby of your replica in another Availability Zone for failover support for the mounted replica. Creating your mounted replica as a Multi-AZ DB instance is independent of whether the source database is a Multi-AZ DB instance.
10. Choose the other settings that you want to use.
11. Choose **Create replica**.

In the **Databases** page, the mounted replica has the role **Replica**.

## AWS CLI

To create an Oracle replica in mounted mode, set `--replica-mode` to `mounted` in the AWS CLI command [create-db-instance-read-replica](#).

### Example

For Linux, macOS, or Unix:

```
aws rds create-db-instance-read-replica \
 --db-instance-identifier myreadreplica \
 --source-db-instance-identifier mydbinstance \
 --replica-mode mounted
```

For Windows:

```
aws rds create-db-instance-read-replica ^
 --db-instance-identifier myreadreplica ^
 --source-db-instance-identifier mydbinstance ^
 --replica-mode mounted
```

To change a read-only replica to a mounted state, set `--replica-mode` to `mounted` in the AWS CLI command [modify-db-instance](#). To place a mounted replica in read-only mode, set `--replica-mode` to `open-read-only`.

## RDS API

To create an Oracle replica in mounted mode, specify `ReplicaMode=mounted` in the RDS API operation [CreateDBInstanceReadReplica](#).

# Modifying the Oracle replica mode

To change the replica mode of an existing replica, use the console, AWS CLI, or RDS API. When you change to mounted mode, the replica disconnects all active connections. When you change to read-only mode, Amazon RDS initializes Active Data Guard.

The change operation can take a few minutes. During the operation, the DB instance status changes to **modifying**. For more information about status changes, see [Viewing DB instance status \(p. 407\)](#).

## Console

### To change the replica mode of an Oracle replica from mounted to read-only

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.

3. Choose the mounted replica database.
4. Choose **Modify**.
5. For **Replica mode**, choose **Read-only**.
6. Choose the other settings that you want to change.
7. Choose **Continue**.
8. For **Scheduling of modifications**, choose **Apply immediately**.
9. Choose **Modify DB instance**.

## AWS CLI

To change a read replica to mounted mode, set `--replica-mode` to `mounted` in the AWS CLI command [modify-db-instance](#). To change a mounted replica to read-only mode, set `--replica-mode` to `open-read-only`.

### Example

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
 --db-instance-identifier myreadreplica \
 --replica-mode mode
```

For Windows:

```
aws rds modify-db-instance ^
 --db-instance-identifier myreadreplica ^
 --replica-mode mode
```

## RDS API

To change a read-only replica to mounted mode, set `ReplicaMode=mounted` in [ModifyDBInstance](#). To change a mounted replica to read-only mode, set `ReplicaMode=read-only`.

# Troubleshooting Oracle replicas

This section describes possible replication problems and solutions.

## Replication lag

To monitor replication lag in Amazon CloudWatch, view the Amazon RDS `ReplicaLag` metric. For information about replication lag time, see [Monitoring read replication \(p. 289\)](#).

If replication lag is too long, query the following views:

- `V$ARCHIVED_LOG` – Shows which commits have been applied to the read replica.
- `V$DATAGUARD_STATS` – Shows a detailed breakdown of the components that make up the `replicaLag` metric.
- `V$DATAGUARD_STATUS` – Shows the log output from Oracle's internal replication processes.

## Replication failure after adding or modifying triggers

If you add or modify any triggers, and if replication fails afterward, the problem may be the triggers. Ensure that the trigger excludes the following user accounts, which are required by RDS for replication:

- User accounts with administrator privileges
- **SYS**
- **SYSTEM**
- **RDS\_DATAGUARD**
- **rdsdb**

For more information, see [Miscellaneous requirements for Oracle replicas \(p. 1133\)](#).

## Adding options to Oracle DB instances

In Amazon RDS, an *option* is an additional feature. Following, you can find a description of options that you can add to Amazon RDS instances running the Oracle DB engine. To enable these options, you add them to an option group, and then associate the option group with your DB instance. For more information, see [Working with option groups \(p. 213\)](#).

Some options require additional memory to run on your DB instance. For example, Oracle Enterprise Manager Database Control uses about 300 MB of RAM. If you enable this option for a small DB instance, you might encounter performance problems due to memory constraints. You can adjust the Oracle parameters so that the database requires less RAM. Alternatively, you can scale up to a larger DB instance.

You can add the following options for Oracle DB instances.

Option	Option ID
<a href="#">Amazon S3 integration (p. 1139)</a>	S3_INTEGRATION
<a href="#">Oracle Application Express (APEX) (p. 1152)</a>	APEX
	APEX-DEV
<a href="#">Oracle Enterprise Manager (p. 1161)</a>	OEM
	OEM_AGENT
<a href="#">Oracle Java virtual machine (p. 1176)</a>	JVM
<a href="#">Oracle Label Security (p. 1179)</a>	OLS
<a href="#">Oracle Locator (p. 1182)</a>	LOCATOR
<a href="#">Oracle Multimedia (p. 1185)</a>	MULTIMEDIA
<a href="#">Oracle native network encryption (p. 1188)</a>	NATIVE_NETWORK_ENCRYPTION
<a href="#">Oracle OLAP (p. 1192)</a>	OLAP
<a href="#">Oracle Secure Sockets Layer (p. 1194)</a>	SSL
<a href="#">Oracle Spatial (p. 1202)</a>	SPATIAL
<a href="#">Oracle SQLT (p. 1205)</a>	SQLT
<a href="#">Oracle Statspack (p. 1210)</a>	STATSPACK
<a href="#">Oracle time zone (p. 1213)</a>	Timezone
<a href="#">Oracle Transparent Data Encryption (p. 1216)</a>	TDE
<a href="#">Oracle UTL_MAIL (p. 1218)</a>	UTL_MAIL
<a href="#">Oracle XML DB (p. 1220)</a>	XMLDB

## Amazon S3 integration

You can transfer files between an Amazon RDS for Oracle DB instance and an Amazon S3 bucket. You can use Amazon S3 integration with Oracle features such as Data Pump. For example, you can download Data Pump files from Amazon S3 to the DB instance host.

**Note**

The DB instance and the Amazon S3 bucket must be in the same AWS Region.

**Topics**

- [Prerequisites for Amazon RDS for Oracle integration with Amazon S3 \(p. 1139\)](#)
- [Adding the Amazon S3 integration option \(p. 1145\)](#)
- [Transferring files between Amazon RDS for Oracle and an Amazon S3 bucket \(p. 1146\)](#)
- [Removing the Amazon S3 integration option \(p. 1150\)](#)

## Prerequisites for Amazon RDS for Oracle integration with Amazon S3

For Amazon RDS for Oracle to integrate with Amazon S3, the Amazon RDS DB instance must have access to an Amazon S3 bucket. Prepare for the integration as follows:

1. Create an AWS Identity and Access Management (IAM) policy with the permissions required to transfer files from your bucket to RDS.

To create the policy, you need the Amazon Resource Name (ARN) value for your bucket. Also, RDS for Oracle supports SSE-KMS and SSE-S3 encryption. If your bucket is encrypted, you need the ARN for your AWS KMS key. For more information, see [Protecting data using server-side encryption](#) in the *Amazon Simple Storage Service Console User Guide*.

**Note**

An Oracle DB instance can't access Amazon S3 buckets encrypted with SSE-C.

2. Create an IAM role, attach your new policy to it, and then attach the role to your Oracle DB instance. The status of the DB instance must be available.

The Amazon VPC used by your DB instance doesn't need to provide access to the Amazon S3 endpoints.

### Console

#### To create an IAM policy to allow Amazon RDS access to an Amazon S3 bucket

1. Open the [IAM Management Console](#).
2. Under **Access management**, choose **Policies**.
3. Choose **Create policy**.
4. On the **Visual editor** tab, choose **Choose a service**, and then choose **S3**.
5. For **Actions**, choose **Expand all**, and then choose the bucket permissions and object permissions required to transfer files from an Amazon S3 bucket to Amazon RDS. For example, do the following:
  - Expand **List**, and then select **ListBucket**.
  - Expand **Read**, and then select **GetObject**.
  - Expand **Write**, and then select **PutObject**.

*Object permissions* are permissions for object operations in Amazon S3, and must be granted for objects in a bucket, not the bucket itself. For more information about permissions for object operations in Amazon S3, see [Permissions for object operations](#).

6. Choose **Resources**, and choose **Add ARN for bucket**.
7. In the **Add ARN(s)** dialog box, provide the details about your resource, and choose **Add**.

Specify the Amazon S3 bucket to allow access to. For instance, to allow Amazon RDS to access the Amazon S3 bucket named `example-bucket`, set the ARN value to `arn:aws:s3:::example-bucket`.

8. If the **object** resource is listed, choose **Add ARN for object**.
9. In the **Add ARN(s)** dialog box, provide the details about your resource.

For the Amazon S3 bucket, specify the Amazon S3 bucket to allow access to. For the object, you can choose **Any** to grant permissions to any object in the bucket.

**Note**

You can set **Amazon Resource Name (ARN)** to a more specific ARN value to allow Amazon RDS to access only specific files or folders in an Amazon S3 bucket. For more information about how to define an access policy for Amazon S3, see [Managing access permissions to your Amazon S3 resources](#).

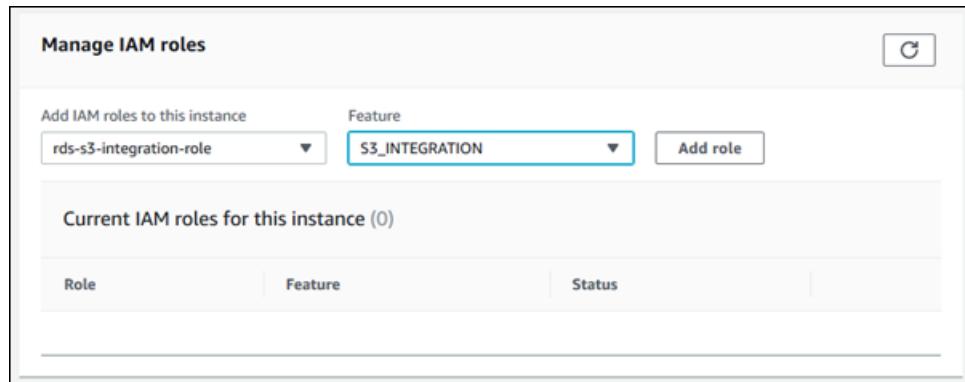

10. (Optional) Choose **Add additional permissions** to add resources to the policy. For example, do the following:
  - If your bucket is encrypted with a custom KMS key, select **KMS** for the service. Select **Encrypt**, **ReEncrypt**, **Decrypt**, **DescribeKey**, and **GenerateDataKey** for actions. Enter the ARN of your custom key as the resource. For more information, see [Protecting Data Using Server-Side Encryption with CMKs Stored in AWS Key Management Service \(SSE-KMS\)](#) in the *Amazon Simple Storage Service Console User Guide*.
  - If you want Amazon RDS to access to access other buckets, add the ARNs for these buckets. Optionally, you can also grant access to all buckets and objects in Amazon S3.
11. Choose **Next: Tags** and then **Next: Review**.
12. For **Name**, enter a name for your IAM policy, for example `rds-s3-integration-policy`. You use this name when you create an IAM role to associate with your DB instance. You can also add an optional **Description** value.
13. Choose **Create policy**.

### To create an IAM role to allow Amazon RDS access to an Amazon S3 bucket

1. In the navigation pane, choose **Roles**.
2. Choose **Create role**.
3. For **AWS service**, choose **RDS**.
4. For **Select your use case**, choose **RDS – Add Role to Database**.
5. Choose **Next: Permissions**.
6. For **Search under Attach permissions policies**, enter the name of the IAM policy you created, and choose the policy when it appears in the list.
7. Choose **Next: Tags** and then **Next: Review**.
8. Set **Role name** to a name for your IAM role, for example `rds-s3-integration-role`. You can also add an optional **Role description** value.
9. Choose **Create role**.

### To associate your IAM role with your DB instance

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. Choose **Databases** from the navigation pane.
3. If your database instance is unavailable, choose **Actions** and then **Start**. When the instance status shows **Started**, go to the next step.
4. Choose the Oracle DB instance name to display its details.
5. On the **Connectivity & security** tab, in the **Manage IAM roles** section, choose the role to add under **Add IAM roles to this instance**.
6. For **Feature**, choose **S3\_INTEGRATION**.

7. Choose **Add role**.

### AWS CLI

#### To grant Amazon RDS access to an Amazon S3 bucket

1. Create an AWS Identity and Access Management (IAM) policy that grants Amazon RDS access to an Amazon S3 bucket.

Include the appropriate actions in the policy based on the type of access required:

- **GetObject** – Required to transfer files from an Amazon S3 bucket to Amazon RDS.
- **ListBucket** – Required to transfer files from an Amazon S3 bucket to Amazon RDS.
- **PutObject** – Required to transfer files from Amazon RDS to an Amazon S3 bucket.

The following AWS CLI command creates an IAM policy named *rds-s3-integration-policy* with these options. It grants access to a bucket named *your-s3-bucket-arn*.

#### Example

For Linux, macOS, or Unix:

```
aws iam create-policy \
--policy-name rds-s3-integration-policy \
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "s3integration",
 "Action": [
 "s3:GetObject",
 "s3:ListBucket"
],
 "Resource": "your-s3-bucket-arn/*"
 }
]
}'
```

```
 "s3>ListBucket",
 "s3PutObject"
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket-arn",
 "arn:aws:s3:::your-s3-bucket-arn/*"
]
}
]'
```

The following example includes permissions for custom KMS keys.

```
aws iam create-policy \
--policy-name rds-s3-integration-policy \
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "s3integration",
 "Action": [
 "s3:GetObject",
 "s3>ListBucket",
 "s3PutObject",
 "kms:Decrypt",
 "kms:Encrypt",
 "kms:ReEncrypt",
 "kms:GenerateDataKey",
 "kms:DescribeKey",
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket-arn",
 "arn:aws:s3:::your-s3-bucket-arn/*",
 "arn:aws:kms:::your-kms-arn"
]
 }
]
}'
```

For Windows:

```
aws iam create-policy ^
--policy-name rds-s3-integration-policy ^
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "s3integration",
 "Action": [
 "s3:GetObject",
 "s3>ListBucket",
 "s3PutObject"
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket-arn",
 "arn:aws:s3:::your-s3-bucket-arn/*"
]
 }
]
}'
```

}'

The following example includes permissions for custom KMS keys.

```
aws iam create-policy ^
--policy-name rds-s3-integration-policy ^
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "s3integration",
 "Action": [
 "s3:GetObject",
 "s3>ListBucket",
 "s3:PutObject",
 "kms:Decrypt",
 "kms:Encrypt",
 "kms:ReEncrypt",
 "kms:GenerateDataKey",
 "kms:DescribeKey",
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket-arn",
 "arn:aws:s3:::your-s3-bucket-arn/*",
 "arn:aws:kms:::your-kms-arn"
]
 }
]
}'
```

2. After the policy is created, note the Amazon Resource Name (ARN) of the policy. You need the ARN for a subsequent step.
3. Create an IAM role that Amazon RDS can assume on your behalf to access your Amazon S3 buckets.

The following AWS CLI command creates the **rds-s3-integration-role** for this purpose.

### Example

For Linux, macOS, or Unix:

```
aws iam create-role \
--role-name rds-s3-integration-role \
--assume-role-policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]
}'
```

For Windows:

```
aws iam create-role ^
--role-name rds-s3-integration-role ^
--assume-role-policy-document '{
```

```
"Version": "2012-10-17",
"Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]'
```

For more information, see [Creating a role to delegate permissions to an IAM user](#) in the *IAM User Guide*.

4. After the role is created, note the ARN of the role. You need the ARN for a subsequent step.
5. Attach the policy you created to the role you created.

The following AWS CLI command attaches the policy to the role named `rds-s3-integration-role`.

### Example

For Linux, macOS, or Unix:

```
aws iam attach-role-policy \
--policy-arn your-policy-arn \
--role-name rds-s3-integration-role
```

For Windows:

```
aws iam attach-role-policy ^
--policy-arn your-policy-arn ^
--role-name rds-s3-integration-role
```

Replace `your-policy-arn` with the policy ARN that you noted in a previous step.

6. Add the role to the Oracle DB instance.

The following AWS CLI command adds the role to an Oracle DB instance named `mydbinstance`.

### Example

For Linux, macOS, or Unix:

```
aws rds add-role-to-db-instance \
--db-instance-identifier mydbinstance \
--feature-name S3_INTEGRATION \
--role-arn your-role-arn
```

For Windows:

```
aws rds add-role-to-db-instance ^
--db-instance-identifier mydbinstance ^
--feature-name S3_INTEGRATION ^
--role-arn your-role-arn
```

Replace *your-role-arn* with the role ARN that you noted in a previous step. `S3_INTEGRATION` must be specified for the `--feature-name` option.

## Adding the Amazon S3 integration option

To use Amazon RDS for Oracle Integration with Amazon S3, your Amazon RDS for Oracle DB instance must be associated with an option group that includes the `S3_INTEGRATION` option.

### Console

#### To configure an option group for Amazon S3 integration

1. Create a new option group or identify an existing option group to which you can add the `S3_INTEGRATION` option.  
For information about creating an option group, see [Creating an option group \(p. 215\)](#).
2. Add the `S3_INTEGRATION` option to the option group.  
For information about adding an option to an option group, see [Adding an option to an option group \(p. 217\)](#).
3. Create a new Oracle DB instance and associate the option group with it, or modify an Oracle DB instance to associate the option group with it.  
For information about creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).  
For information about modifying an Oracle DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

### AWS CLI

#### To configure an option group for Amazon S3 integration

1. Create a new option group or identify an existing option group to which you can add the `S3_INTEGRATION` option.  
For information about creating an option group, see [Creating an option group \(p. 215\)](#).
2. Add the `S3_INTEGRATION` option to the option group.  
For example, the following AWS CLI command adds the `S3_INTEGRATION` option to an option group named `myoptiongroup`.

### Example

For Linux, macOS, or Unix:

```
aws rds add-option-to-option-group \
--option-group-name myoptiongroup \
--options OptionName=S3_INTEGRATION,OptionVersion=1.0
```

For Windows:

```
aws rds add-option-to-option-group ^
--option-group-name myoptiongroup ^
```

```
--options OptionName=S3_INTEGRATION,OptionVersion=1.0
```

3. Create a new Oracle DB instance and associate the option group with it, or modify an Oracle DB instance to associate the option group with it.

For information about creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

For information about modifying an Oracle DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Transferring files between Amazon RDS for Oracle and an Amazon S3 bucket

You can use Amazon RDS procedures to transfer files between an Oracle DB instance and an Amazon S3 bucket.

### Note

These procedures upload or download the files in a single directory. You can't include subdirectories in these operations.

### Topics

- [Uploading files from an Oracle DB instance to an Amazon S3 bucket \(p. 1146\)](#)
- [Downloading files from an Amazon S3 bucket to an Oracle DB instance \(p. 1148\)](#)
- [Monitoring the status of a file transfer \(p. 1150\)](#)

## Uploading files from an Oracle DB instance to an Amazon S3 bucket

You can upload files from an Oracle DB instance to an Amazon S3 bucket. For example, you can upload Oracle Recovery Manager (RMAN) backup files. The maximum object size in an Amazon S3 bucket is 5 TB. For more information about working with objects, see [Amazon Simple Storage Service Developer Guide](#). For more information about performing RMAN backups, see [Performing common RMAN tasks for Oracle DB instances \(p. 1081\)](#).

You upload files using the `rdsadmin.rdsadmin_s3_tasks.upload_to_s3` procedure. This procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_bucket_name</code>	VARCHAR2	–	required	The name of the Amazon S3 bucket to upload files to.
<code>p_directory_name</code>	VARCHAR2	–	required	The name of the Oracle directory object to upload files from. The directory can be any user-created directory object or the Data Pump directory, such as <code>DATA_PUMP_DIR</code> .

### Note

You can only upload files from the specified directory. You can't upload files

Parameter name	Data type	Default	Required	Description
				in subdirectories in the specified directory.
p_s3_prefix	VARCHAR2	–	required	An Amazon S3 file name prefix that files are uploaded to. An empty prefix uploads all files to the top level in the specified Amazon S3 bucket and doesn't add a prefix to the file names.  For example, if the prefix is <code>folder_1/oradb</code> , files are uploaded to <code>folder_1</code> . In this case, the <code>oradb</code> prefix is added to each file.
p_prefix	VARCHAR2	–	required	A file name prefix that file names must match to be uploaded. An empty prefix uploads all files in the specified directory.

The return value for the `rdsadmin.rdsadmin_s3_tasks.upload_to_s3` procedure is a task ID.

The following example uploads all of the files in the `DATA_PUMP_DIR` directory to the Amazon S3 bucket named `mys3bucket`.

```
SELECT rdsadmin.rdsadmin_s3_tasks.upload_to_s3(
 p_bucket_name => 'mys3bucket',
 p_prefix => '',
 p_s3_prefix => '',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

The following example uploads all of the files with the prefix `db` in the `DATA_PUMP_DIR` directory to the Amazon S3 bucket named `mys3bucket`.

```
SELECT rdsadmin.rdsadmin_s3_tasks.upload_to_s3(
 p_bucket_name => 'mys3bucket',
 p_prefix => 'db',
 p_s3_prefix => '',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

The following example uploads all of the files in the `DATA_PUMP_DIR` directory to the Amazon S3 bucket named `mys3bucket`. The files are uploaded to a `dbfiles` folder.

```
SELECT rdsadmin.rdsadmin_s3_tasks.upload_to_s3(
 p_bucket_name => 'mys3bucket',
 p_prefix => '',
 p_s3_prefix => 'dbfiles/',
 p_directory_name => 'DATA_PUMP_DIR')
```

```
AS TASK_ID FROM DUAL;
```

The following example uploads all of the files in the `DATA_PUMP_DIR` directory to the Amazon S3 bucket named `mys3bucket`. The files are uploaded to a `dbfiles` folder and `ora` is added to the beginning of each file name.

```
SELECT rdsadmin.rdsadmin_s3_tasks.upload_to_s3(
 p_bucket_name => 'mys3bucket',
 p_prefix => '',
 p_s3_prefix => 'dbfiles/ora',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

In each example, the `SELECT` statement returns the ID of the task in a `VARCHAR2` data type.

You can view the result by displaying the task's output file.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-task-id.log'));
```

Replace `task-id` with the task ID returned by the procedure.

**Note**

Tasks are executed asynchronously.

## Downloading files from an Amazon S3 bucket to an Oracle DB instance

To download files from an Amazon S3 bucket to an Oracle DB instance, use the Amazon RDS procedure `rdsadmin.rdsadmin_s3_tasks.download_from_s3`. The `rdsadmin.rdsadmin_s3_tasks.download_from_s3` procedure has the following parameters.

Parameter name	Data type	Default	Required	Description
<code>p_bucket_name</code>	<code>VARCHAR2</code>	–	required	The name of the Amazon S3 bucket to download files from.
<code>p_directory_name</code>	<code>VARCHAR2</code>	–	required	The name of the Oracle directory object to download files to. The directory can be any user-created directory object or the Data Pump directory, such as <code>DATA_PUMP_DIR</code> .
<code>p_s3_prefix</code>	<code>VARCHAR2</code>	“”	optional	A file name prefix that file names must match to be downloaded. An empty prefix downloads all of the top level files in the specified Amazon S3 bucket, but not the files in folders in the bucket.

Parameter name	Data type	Default	Required	Description
				<p>The procedure downloads Amazon S3 objects only from the first level folder that matches the prefix. Nested directory structures matching the specified prefix are not downloaded.</p> <p>For example, suppose that an Amazon S3 bucket has the folder structure <code>folder_1/folder_2/folder_3</code>. Suppose also that you specify the <code>'folder_1/folder_2/'</code> prefix. In this case, only the files in <code>folder_2</code> are downloaded, not the files in <code>folder_1</code> or <code>folder_3</code>.</p> <p>If, instead, you specify the <code>'folder_1/folder_2'</code> prefix, all files in <code>folder_1</code> that match the <code>'folder_2'</code> prefix are downloaded, and no files in <code>folder_2</code> are downloaded.</p>

The return value for the `rdsadmin.rdsadmin_s3_tasks.download_from_s3` procedure is a task ID.

The following example downloads all of the files in the Amazon S3 bucket named `mys3bucket` to the `DATA_PUMP_DIR` directory.

```
SELECT rdsadmin.rdsadmin_s3_tasks.download_from_s3(
 p_bucket_name => 'mys3bucket',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

The following example downloads all of the files with the prefix `db` in the Amazon S3 bucket named `mys3bucket` to the `DATA_PUMP_DIR` directory.

```
SELECT rdsadmin.rdsadmin_s3_tasks.download_from_s3(
 p_bucket_name => 'mys3bucket',
 p_s3_prefix => 'db',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

The following example downloads all of the files in the folder `myfolder/` in the Amazon S3 bucket named `mys3bucket` to the `DATA_PUMP_DIR` directory. Use the `prefix` parameter setting to specify the Amazon S3 folder.

```
SELECT rdsadmin.rdsadmin_s3_tasks.download_from_s3(
 p_bucket_name => 'mys3bucket',
 p_s3_prefix => 'myfolder/',
 p_directory_name => 'DATA_PUMP_DIR')
AS TASK_ID FROM DUAL;
```

In each example, the `SELECT` statement returns the ID of the task in a `VARCHAR2` data type.

You can view the result by displaying the task's output file.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-task-id.log'));
```

Replace `task-id` with the task ID returned by the procedure.

**Note**

Tasks are executed asynchronously.

You can use the `UTL_FILE.FREMOVE` Oracle procedure to remove files from a directory. For more information, see [FREMOVE procedure](#) in the Oracle documentation.

## Monitoring the status of a file transfer

File transfer tasks publish Amazon RDS events when they start and when they complete. For information about viewing events, see [Viewing Amazon RDS events \(p. 503\)](#).

You can view the status of an ongoing task in a bdump file. The bdump files are located in the `/rdsdbdata/log/trace` directory. Each bdump file name is in the following format.

```
dbtask-task-id.log
```

Replace `task-id` with the ID of the task that you want to monitor.

**Note**

Tasks are executed asynchronously.

You can use the `rdsadmin.rds_file_util.read_text_file` stored procedure to view the contents of bdump files. For example, the following query returns the contents of the `dbtask-1546988886389-2444.log` bdump file.

```
SELECT text FROM
table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-1546988886389-2444.log'));
```

## Removing the Amazon S3 integration option

You can remove Amazon S3 integration option from a DB instance.

To remove the Amazon S3 integration option from a DB instance, do one of the following:

- To remove the Amazon S3 integration option from multiple DB instances, remove the `S3_INTEGRATION` option from the option group to which the DB instances belong. This change affects

all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).

- To remove the Amazon S3 integration option from a single DB instance, modify the DB instance and specify a different option group that doesn't include the `S3_INTEGRATION` option. You can specify the default (empty) option group or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Application Express (APEX)

Amazon RDS supports Oracle Application Express (APEX) through the use of the `APEX` and `APEX-DEV` options. Oracle APEX can be deployed as a run-time environment or as a full development environment for web-based applications. Using Oracle APEX, developers can build applications entirely within the web browser. For more information, see [Oracle application Express](#) in the Oracle documentation.

Oracle APEX consists of the following main components:

- A *repository* that stores the metadata for APEX applications and components. The repository consists of tables, indexes, and other objects that are installed in your Amazon RDS DB instance.
- A *listener* that manages HTTP communications with Oracle APEX clients. The listener accepts incoming connections from web browsers, forwards them to the Amazon RDS DB instance for processing, and then sends results from the repository back to the browsers. Amazon RDS for Oracle supports the following types of listeners:
  - For APEX version 5.0 and later, use Oracle Rest Data Services (ORDS) version 19.1 and higher. We recommend that you use the latest supported version of Oracle APEX and ORDS. The documentation describes older versions for backwards compatibility only.
  - For APEX version 4.1.1, you can use Oracle APEX Listener version 1.1.4.
  - Oracle HTTP Server and `mod_plsql`.

**Note**

Amazon RDS doesn't support the Oracle XML DB HTTP server with the embedded PL/SQL gateway; you can't use this as a listener for APEX. In general, Oracle recommends against using the embedded PL/SQL gateway for applications that run on the internet.

For more information about these listener types, see [About choosing a web listener](#) in the Oracle documentation.

When you add the Amazon RDS APEX options to your DB instance, Amazon RDS installs the Oracle APEX repository only. Install your listener on a separate host, such as an Amazon EC2 instance, an on-premises server at your company, or your desktop computer.

The APEX option uses storage on the DB instance class for your DB instance. Following are the supported versions and approximate storage requirements for Oracle APEX.

APEX version	Storage requirements	Supported Oracle database versions	Notes
Oracle APEX version 20.2.v1	148 MiB	All	<p>This version includes patch <code>p32006852_2020_Generic</code>. You can see the patch number and date by running the following query:</p> <pre>SELECT PATCH_VERSION,        PATCH_NUMBER   FROM   APEX_PATCHES;</pre>
Oracle APEX version 20.1.v1	173 MiB	All	This version includes patch <code>30990551</code> .
Oracle APEX version 19.2.v1	149 MiB	All	
Oracle APEX version 19.1.v1	148 MiB	All	

APEX version	Storage requirements	Supported Oracle database versions	Notes
Oracle APEX version 18.2.v1	146 MiB	All except 19c	
Oracle APEX version 18.1.v1	145 MiB	All except 19c	
Oracle APEX version 5.1.4.v1	220 MiB	All except 19c	
Oracle APEX version 5.1.2.v1	150 MiB	12.1 only	
Oracle APEX version 5.0.4.v1	140 MiB	12.1 only	
Oracle APEX version 4.2.6.v1	160 MiB	12.1 only	

## Prerequisites for Oracle APEX and ORDS

To use Oracle APEX and ORDS, make sure you have the following:

- The Java Runtime Environment (JRE)
- An Oracle client installation that includes the following:
  - SQL\*Plus or SQL Developer for administration tasks
  - Oracle Net Services for configuring connections to your Oracle instance

## Adding the Amazon RDS APEX options

The general process for adding the Amazon RDS APEX options to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the options to the option group.
3. Associate the option group with the DB instance.

When you add the Amazon RDS APEX options, a brief outage occurs while your DB instance is automatically restarted.

### To add the APEX options to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose the Oracle edition that you want to use. The APEX options are supported on all editions.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the options to the option group. If you want to deploy only the Oracle APEX run-time environment, add only the **APEX** option. If you want to deploy the full development environment, add both the **APEX** and **APEX-DEV** options. For Oracle Database 12c, add the **APEX** and **APEX-DEV** options.

For **Version**, choose the version of APEX that you want to use. If you don't choose a version, version 4.2.6.v1 is the default for Oracle Database 12c.

**Important**

If you add the APEX options to an existing option group that is already attached to one or more DB instances, a brief outage occurs. During this outage, all the DB instances are automatically restarted.

For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).

3. Apply the option group to a new or existing DB instance:

- For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. When you add the APEX options to an existing DB instance, a brief outage occurs while your DB instance is automatically restarted. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Unlocking the public user account

After the Amazon RDS APEX options are installed, you must change the password for the APEX public user account, and then unlock the account. You can do this by using the Oracle SQL\*Plus command line utility. Connect to your DB instance as the master user, and issue the following commands. Replace `new_password` with a password of your choice.

```
alter user APEX_PUBLIC_USER identified by new_password;
alter user APEX_PUBLIC_USER account unlock;
```

## Configuring RESTful services for Oracle APEX

To configure RESTful services in APEX (not needed for APEX 4.1.1.V1), use SQL\*Plus to connect to your DB instance as the master user. After you do this, run the `rdsadmin.rdsadmin_run_apex_rest_config` stored procedure. When you run the stored procedure, you provide passwords for the following users:

- `APEX_LISTENER`
- `APEX_REST_PUBLIC_USER`

The stored procedure runs the `apex_rest_config.sql` script, which creates new database accounts for these users.

**Note**

Configuration isn't required for Oracle APEX version 4.1.1.v1. For this Oracle APEX version only, you don't need to run the stored procedure.

The following command runs the stored procedure.

```
exec rdsadmin.rdsadmin_run_apex_rest_config('apex_listener_password',
'apex_rest_public_user_password');
```

## Setting up ORDS for Oracle APEX

You are now ready to install and configure Oracle Rest Data Services (ORDS) for use with Oracle APEX. For APEX version 5.0 and later, use Oracle Rest Data Services (ORDS) version 19.1 and higher.

Install the listener on a separate host such as an Amazon EC2 instance, an on-premises server at your company, or your desktop computer. For the examples in this section, we assume that the name of your host is `myapexhost.example.com`, and that your host is running Linux.

## Preparing to install ORDS

Before you can install ORDS, you need to create a nonprivileged OS user, and then download and unzip the APEX installation file.

### To prepare for ORDS installation

1. Log in to `myapexhost.example.com` as `root`.
2. Create a nonprivileged OS user to own the listener installation. The following command creates a new user named `apexuser`.

```
useradd -d /home/apexuser apexuser
```

The following command assigns a password to the new user.

```
passwd apexuser;
```

3. Log in to `myapexhost.example.com` as `apexuser`, and download the APEX installation file from Oracle to your `/home/apexuser` directory:
  - <http://www.oracle.com/technetwork/developer-tools/apex/downloads/index.html>
  - [Oracle application Express prior release archives](#)
4. Unzip the file in the `/home/apexuser` directory.

```
unzip apex_<version>.zip
```

After you unzip the file, there is an `apex` directory in the `/home/apexuser` directory.

5. While you are still logged into `myapexhost.example.com` as `apexuser`, download the Oracle REST Data Services file from Oracle to your `/home/apexuser` directory: <http://www.oracle.com/technetwork/developer-tools/apex-listener/downloads/index.html>.

## Installing and configuring ORDS

Before you can use APEX, you need to download the `ords.war` file, use Java to install ORDS, and then start the listener.

### To install and configure ORDS for use with Oracle APEX

1. Create a new directory based on ORDS, and then unzip the listener file.

```
mkdir /home/apexuser/ORDS
cd /home/apexuser/ORDS
```

2. Download the file `ords.version.number.zip` from [Oracle REST data services](#).
3. Unzip the file into the `/home/apexuser/ORDS` directory.
4. Grant the master user the required privileges to install ORDS.

After the Amazon RDS APEX option is installed, give the master user the required privileges to install the ORDS schema. You can do this by connecting to the database and running the following commands. Replace `master_user` with the name of your master user.

```
exec rdsadmin.rdsadmin_util.grant_sys_object('DBA_OBJECTS', 'master_user', 'SELECT',
true);
```

```
exec rdsadmin.rdsadmin_util.grant_sys_object('DBA_ROLE_PRIVS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('DBA_TAB_COLUMNS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_CONS_COLUMNS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_CONSTRAINTS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_OBJECTS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_PROCEDURES', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_TAB_COLUMNS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_TABLES', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('USER_VIEWS', 'master_user', 'SELECT', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('WPIUTL', 'master_user', 'EXECUTE', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('DBMS_SESSION', 'master_user', 'EXECUTE', true);
exec rdsadmin.rdsadmin_util.grant_sys_object('DBMS_UTLILITY', 'master_user', 'EXECUTE', true);
```

**Note**

These commands apply to ORDS version 19.1 and later.

5. Install the ORDS schema using the downloaded ords.war file.

```
java -jar ords.war install advanced
```

The program prompts you for the following information. The default values are in brackets. For more information, see [Introduction to Oracle REST data services](#) in the Oracle documentation.

- Enter the location to store configuration data:

Enter /home/apexuser/ORDS. This is the location of the ORDS configuration files.

- Specify the database connection type to use. Enter number for [1] Basic [2] TNS [3] Custom URL [1]:

Choose the desired connection type.

- Enter the name of the database server [localhost]: *DB\_instance\_endpoint*

Choose the default or enter the correct value.

- Enter the database listener port [1521]: *DB\_instance\_port*

Choose the default or enter the correct value.

- Enter 1 to specify the database service name, or 2 to specify the database SID [1]:

Choose 2 to specify the database SID.

- Database SID [xe]

Choose the default or enter the correct value.

- Enter 1 if you want to verify/install Oracle REST Data Services schema or 2 to skip this step [1]:

Choose 1. This step creates the Oracle REST Data Services proxy user named ORDS\_PUBLIC\_USER.

- Enter the database password for ORDS\_PUBLIC\_USER:

Enter the password, and then confirm it.

- Requires to login with administrator privileges to verify Oracle REST Data Services schema.

Enter the administrator user name: *master\_user*

Enter the database password for *master\_user*: *master\_user\_password*

Confirm the password: *master\_user\_password*

- Enter the default tablespace for ORDS\_METADATA [SYSAUX].

Enter the temporary tablespace for ORDS\_METADATA [TEMP].

Enter the default tablespace for ORDS\_PUBLIC\_USER [USERS].

Enter the temporary tablespace for ORDS\_PUBLIC\_USER [TEMP].

- Enter 1 if you want to use PL/SQL Gateway or 2 to skip this step. If you're using Oracle Application Express or migrating from mod\_plsql, you must enter 1 [1].

Choose the default.

- Enter the PL/SQL Gateway database user name [APEX\_PUBLIC\_USER]

Choose the default.

- Enter the database password for APEX\_PUBLIC\_USER:

Enter the password, and then confirm it.

- Enter 1 to specify passwords for Application Express RESTful Services database users (APEX\_LISTENER, APEX\_REST\_PUBLIC\_USER) or 2 to skip this step [1]:

Choose 2 for APEX 4.1.1.V1; choose 1 for all other APEX versions.

- [Not needed for APEX 4.1.1.v1] Database password for APEX\_LISTENER

Enter the password (if required), and then confirm it.

- [Not needed for APEX 4.1.1.v1] Database password for APEX\_REST\_PUBLIC\_USER

Enter the password (if required), and then confirm it.

- Enter a number to select a feature to enable:

Enter 1 to enable all features: SQL Developer Web, REST Enabled SQL, and Database API.

- Enter 1 if you wish to start in standalone mode or 2 to exit [1]:

Enter 1.

- Enter the APEX static resources location:

If you unzipped APEX installation files into /home/apexuser, enter /home/apexuser/apex/images. Otherwise, enter *unzip\_path*/apex/images, where *unzip\_path* is the directory where you unzipped the file.

- Enter 1 if using HTTP or 2 if using HTTPS [1]:

If you enter 1, specify the HTTP port. If you enter 2, specify the HTTPS port and the SSL host name. The HTTPS option prompts you to specify how you will provide the certificate:

- Enter 1 to use the self-signed certificate.
- Enter 2 to provide your own certificate. If you enter 2, specify the path for the SSL certificate and the path for the SSL certificate private key.

6. Set a password for the APEX admin user. To do this, use SQL\*Plus to connect to your DB instance as the master user, and then run the following commands.

```
EXEC rdsadmin.rdsadmin_util.grant_apex_admin_role;
```

```
grant APEX_ADMINISTRATOR_ROLE to master;
@/home/apexuser/apex/apxchpwd.sql
```

Replace *master* with your master user name. When the `apxchpwd.sql` script prompts you, enter a new admin password.

7. Start the ORDS listener. Run the following code.

```
java -jar ords.war
```

The first time you start ORDS, you are prompted to provide the location of the APEX Static resources. This images folder is located in the `/apex/images` directory in the installation directory for APEX.

8. Return to the APEX administration window in your browser and choose **Administration**. Next, choose **Application Express Internal Administration**. When you are prompted for credentials, enter the following information:
  - **User name** – `admin`
  - **Password** – the password you set using the `apxchpwd.sql` script

Choose **Login**, and then set a new password for the `admin` user.

Your listener is now ready for use.

## Setting up Oracle APEX listener

### Note

Oracle APEX Listener is deprecated.

Amazon RDS for Oracle continues to support APEX version 4.1.1 and Oracle APEX Listener version 1.1.4. We recommend that you use the latest supported versions of Oracle APEX and ORDS.

Install Oracle APEX Listener on a separate host such as an Amazon EC2 instance, an on-premises server at your company, or your desktop computer. We assume that the name of your host is `myapexhost.example.com`, and that your host is running Linux.

## Preparing to install Oracle APEX listener

Before you can install Oracle APEX Listener, you need to create a nonprivileged OS user, and then download and unzip the APEX installation file.

### To prepare for Oracle APEX listener installation

1. Log in to `myapexhost.example.com` as `root`.
2. Create a nonprivileged OS user to own the listener installation. The following command creates a new user named `apexuser`.

```
useradd -d /home/apexuser apexuser
```

The following command assigns a password to the new user.

```
passwd apexuser;
```

3. Log in to `myapexhost.example.com` as `apexuser`, and download the APEX installation file from Oracle to your `/home/apexuser` directory.

- <http://www.oracle.com/technetwork/developer-tools/apex/downloads/index.html>
  - [Oracle Application Express prior release archives](#)
4. Unzip the file in the /home/apexuser directory.

```
unzip apex_<version>.zip
```

After you unzip the file, there is an apex directory in the /home/apexuser directory.

5. While you are still logged into myapexhost.example.com as apexuser, download the Oracle APEX Listener file from Oracle to your /home/apexuser directory.

## Installing and configuring Oracle APEX listener

Before you can use APEX, you need to download the apex.war file, use Java to install Oracle APEX Listener, and then start the listener.

### To install and configure Oracle APEX listener

1. Create a new directory based on Oracle APEX Listener and open the listener file.

Run the following code:

```
mkdir /home/apexuser/apexlistener
cd /home/apexuser/apexlistener
unzip ..//apex_listener.<version>.zip
```

2. Run the following code.

```
java -Dapex.home=../apex -Dapex.images=/home/apexuser/apex/images -Dapex.erase -jar ../apex.war
```

3. Enter information for the program prompts following:

- The APEX Listener Administrator user name. The default is *adminlistener*.
- A password for the APEX Listener Administrator.
- The APEX Listener Manager user name. The default is *managerlistener*.
- A password for the APEX Listener Administrator.

The program prints a URL that you need to complete the configuration, as follows.

```
INFO: Please complete configuration at: http://localhost:8080/apex/listenerConfigure
Database is not yet configured
```

4. Leave Oracle APEX Listener running so that you can use Oracle Application Express. When you have finished this configuration procedure, you can run the listener in the background.
5. From your web browser, go to the URL provided by the APEX Listener program. The Oracle Application Express Listener administration window appears. Enter the following information:
- **Username** – APEX\_PUBLIC\_USER
  - **Password** – the password for APEX\_PUBLIC\_USER. This password is the one that you specified earlier when you configured the APEX repository. For more information, see [Unlocking the public user account \(p. 1154\)](#).
  - **Connection type** – Basic

- **Hostname** – the endpoint of your Amazon RDS DB instance, such as `mydb.f9rbfa893tft.us-east-1.rds.amazonaws.com`.
  - **Port** – 1521
  - **SID** – the name of the database on your Amazon RDS DB instance, such as `mydb`.
6. Choose **Apply**. The APEX administration window appears.
  7. Set a password for the APEX admin user. To do this, use SQL\*Plus to connect to your DB instance as the master user, and then run the following commands.

```
EXEC rdsadmin.rdsadmin_util.grant_apex_admin_role;
grant APEX_ADMINISTRATOR_ROLE to master;
@/home/apexuser/apex/apxchpwd.sql
```

Replace `master` with your master user name. When the `apxchpwd.sql` script prompts you, enter a new admin password.

8. Return to the APEX administration window in your browser and choose **Administration**. Next, choose **Application Express Internal Administration**. When you are prompted for credentials, enter the following information:

- **User name** – `admin`
- **Password** – the password you set using the `apxchpwd.sql` script

Choose **Login**, and then set a new password for the `admin` user.

Your listener is now ready for use.

## Upgrading the APEX version

### Important

Back up your DB instance before you upgrade APEX. For more information, see [Creating a DB snapshot \(p. 349\)](#) and [Testing an Oracle DB upgrade \(p. 1227\)](#).

To upgrade APEX with your DB instance, do the following:

- Create a new option group for the upgraded version of your DB instance.
- Add the upgraded versions of APEX and APEX-DEV to the new option group. Be sure to include any other options that your DB instance uses. For more information, see [Option group considerations \(p. 1225\)](#).
- When you upgrade your DB instance, specify the new option group for your upgraded DB instance.

After you upgrade your version of APEX, the APEX schema for the previous version might still exist in your database. If you don't need it anymore, you can drop the old APEX schema from your database after you upgrade.

If you upgrade the APEX version and RESTful services were not configured in the previous APEX version, we recommend that you configure RESTful services. For more information, see [Configuring RESTful services for Oracle APEX \(p. 1154\)](#).

In some cases when you plan to do a major version upgrade of your DB instance, you might find that you're using an APEX version that isn't compatible with your target database version. In these cases, you can upgrade your version of APEX before you upgrade your DB instance. Upgrading APEX first can reduce the amount of time that it takes to upgrade your DB instance.

### Note

After upgrading APEX, install and configure a listener for use with the upgraded version. For instructions, see [Setting up Oracle APEX listener \(p. 1158\)](#).

## Removing the APEX option

You can remove the Amazon RDS APEX options from a DB instance. To remove the APEX options from a DB instance, do one of the following:

- To remove the APEX options from multiple DB instances, remove the APEX options from the option group they belong to. This change affects all DB instances that use the option group. When you remove the APEX options from an option group that is attached to multiple DB instances, a brief outage occurs while all the DB instances are restarted.

For more information, see [Removing an option from an option group \(p. 225\)](#).

- To remove the APEX options from a single DB instance, modify the DB instance and specify a different option group that doesn't include the APEX options. You can specify the default (empty) option group, or a different custom option group. When you remove the APEX options, a brief outage occurs while your DB instance is automatically restarted.

For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

When you remove the APEX options from a DB instance, the APEX schema is removed from your database.

## Oracle Enterprise Manager

Amazon RDS supports Oracle Enterprise Manager (OEM). OEM is the Oracle product line for integrated management of enterprise information technology.

Amazon RDS supports OEM through the following options.

Option	Option ID	Support for
<a href="#">OEM Database Express (p. 1162)</a>	OEM	OEM Database Express 12c
<a href="#">OEM Management Agent (p. 1166)</a>	OEM_AGENT	OEM Cloud Control for 13c OEM Cloud Control for 12c

**Note**

You can use OEM Database or OEM Management Agent, but not both.

**Note**

These options aren't supported for the single-tenant architecture.

## Oracle Enterprise Manager Database Express

Amazon RDS supports Oracle Enterprise Manager (OEM) Database Express through the use of the OEM option. Amazon RDS supports Oracle Enterprise Manager Database Express for Oracle Database 19c, Oracle Database 18c, and Oracle Database 12c.

OEM Database Express and Database Control are similar tools that have a web-based interface for Oracle database administration. For more information about these tools, see [Accessing Enterprise Manager database Express 18c](#) and [Accessing Enterprise Manager Database Express 12c](#) in the Oracle documentation.

The following is a limitation for OEM Database Express:

- OEM Database Express isn't supported on the db.t3.micro or db.t3.small DB instance classes.

For more information about DB instance classes, see [RDS for Oracle instance classes \(p. 1002\)](#).

### OEM Database option settings

Amazon RDS supports the following settings for the OEM option.

Option setting	Valid values	Description
<b>Port</b>	An integer value	The port on the DB instance that listens for OEM Database. The default for OEM Database Express is 5500.
<b>Security Groups</b>	—	A security group that has access to <b>Port</b> .

### Adding the OEM Database option

The general process for adding the OEM option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

When you add the OEM option for an Oracle Database 12c or later DB instance, a brief outage occurs while your DB instance is automatically restarted.

#### To add the OEM option to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine** choose the oracle edition for your DB instance.
  - b. For **Major engine version** choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the OEM option to the option group, and configure the option settings. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#). For more information about each setting, see [OEM Database option settings \(p. 1162\)](#).

**Note**

If you add the OEM option to an existing option group that is already attached to one or more Oracle Database 19c, Oracle Database 18c, or Oracle Database 12c DB instances, a brief outage occurs while all the DB instances are automatically restarted.

3. Apply the option group to a new or existing DB instance:

- For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. When you add the OEM option for an Oracle Database 19c, Oracle Database 18c, or Oracle Database 12c DB instance, a brief outage occurs while your DB instance is automatically restarted. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

**Note**

You can also use the AWS CLI to add the OEM option. For examples, see [Adding an option to an option group \(p. 217\)](#).

## Using OEM Database

After you enable the OEM option, you can begin using the OEM Database tool from your web browser.

You can access either OEM Database Control or OEM Database Express from your web browser. For example, if the endpoint for your Amazon RDS DB instance is `mydb.f9rbfa893tft.us-east-1.rds.amazonaws.com`, and your OEM port is 1158, then the URL to access the OEM Database Control the following.

```
https://mydb.f9rbfa893tft.us-east-1.rds.amazonaws.com:1158/em
```

When you access either tool from your web browser, a login window appears that prompts you for a user name and password. Type the master user name and master password for your DB instance. You are now ready to manage your Oracle databases.

## Modifying OEM Database settings

After you enable OEM Database, you can modify the Security Groups setting for the option.

You can't modify the OEM port number after you have associated the option group with a DB instance. To change the OEM port number for a DB instance, do the following:

1. Create a new option group.
2. Add the OEM option with the new port number to the new option group.
3. Remove the existing option group from the DB instance.
4. Add the new option group to the DB instance.

For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#). For more information about each setting, see [OEM Database option settings \(p. 1162\)](#).

## Using OEM Database

You can use Amazon RDS procedures to run certain OEM Database Express tasks. By running these procedures, you can do the tasks listed following.

**Note**

OEM Database Express tasks run asynchronously.

**Tasks**

- [Switching the website front end for OEM Database Express to Adobe Flash \(p. 1164\)](#)
- [Switching the website front end for OEM Database Express to Oracle JET \(p. 1164\)](#)

### [Switching the website front end for OEM Database Express to Adobe Flash](#)

**Note**

This task is only available on instances running Oracle Database 19c or later.

Starting with Oracle Database 19c, Oracle has deprecated the former OEM Database Express user interface, which was based on Adobe Flash. Instead, OEM Database Express now uses an interface built with Oracle JET. If you experience difficulties with the new interface, you can switch back to the deprecated Flash-based interface. Difficulties you might experience with the new interface include being stuck on a Loading screen after logging in to OEM Database Express. You might also miss certain features that were present in the Flash-based version of OEM Database Express.

To switch the OEM Database Express website front end to Adobe Flash, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_flash`. This procedure is equivalent to the `execemx emx` SQL command.

Security best practices discourage the use of Adobe Flash. Although you can revert to the Flash-based OEM Database Express, we recommend the use of the JET-based OEM Database Express websites if possible. If you revert to using Adobe Flash and want to switch back to using Oracle JET, use the `rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_jet` procedure. After an Oracle database upgrade, a newer version of Oracle JET might resolve JET-related issues in OEM Database Express. For more information about switching to Oracle JET, see [Switching the website front end for OEM Database Express to Oracle JET \(p. 1164\)](#).

**Note**

Running this task from the source DB instance for a read replica also causes the read replica to switch its OEM Database Express website front ends to Adobe Flash.

The following procedure invocation creates a task to switch the OEM Database Express website to Adobe Flash and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_flash() as TASK_ID from DUAL;
```

You can view the result by displaying the task's output file.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-task-id.log'));
```

Replace `task-id` with the task ID returned by the procedure. For more information about the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`, see [Reading files in a DB instance directory \(p. 1109\)](#).

You can also view the contents of the task's output file in the AWS Management Console by searching the log entries in the **Logs & events** section for the task-id.

### [Switching the website front end for OEM Database Express to Oracle JET](#)

**Note**

This task is only available on Oracle DB instances running version 19c or later.

To switch the OEM Database Express website front end to Oracle JET, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_jet`. This procedure is equivalent to the `execemx omx` SQL command.

By default, the OEM Database Express websites for Oracle DB instances running 19c or later use Oracle JET. If you used the `rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_flash` procedure to switch the OEM Database Express website front end to Adobe Flash, you can switch back to Oracle JET. To do this, use the `rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_jet` procedure. For more information about switching to Adobe Flash, see [Switching the website front end for OEM Database Express to Adobe Flash \(p. 1164\)](#).

**Note**

Running this task from the source DB instance for a read replica also causes the read replica to switch its OEM Database Express website front ends to Oracle JET.

The following procedure invocation creates a task to switch the OEM Database Express website to Oracle JET and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_tasks.em_express_frontend_to_jet() as TASK_ID from DUAL;
```

You can view the result by displaying the task's output file.

```
SELECT text FROM table(rdsadmin.rds_file_util.read_text_file('BDUMP', 'dbtask-task-id.log'));
```

Replace `task-id` with the task ID returned by the procedure. For more information about the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`, see [Reading files in a DB instance directory \(p. 1109\)](#)

You can also view the contents of the task's output file in the AWS Management Console by searching the log entries in the **Logs & events** section for the `task-id`.

## Removing the OEM Database option

You can remove the OEM option from a DB instance. When you remove the OEM option for an Oracle Database 12c or later DB instance, a brief outage occurs while your instance is automatically restarted. Therefore, after you remove the OEM option, you don't need to restart your DB instance.

To remove the OEM option from a DB instance, do one of the following:

- Remove the OEM option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- Modify the DB instance and specify a different option group that doesn't include the OEM option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Management Agent for Enterprise Manager Cloud Control

Oracle Enterprise Manager (OEM) Management Agent is a software component that monitors targets running on hosts and communicates that information to the middle-tier Oracle Management Service (OMS). For more information, see [Overview of Oracle Enterprise Manager cloud control 12c](#) and [Overview of Oracle Enterprise Manager cloud control 13c](#) in the Oracle documentation.

Amazon RDS supports Management Agent through the use of the `OEM_AGENT` option. Management Agent requires an Amazon RDS DB instance running Oracle Database 19c (19.0.0.0), 18.0.0.0, 12.2.0.1, or 12.1.0.2.

Amazon RDS supports Management Agent for the following versions of OEM:

- Oracle Enterprise Manager Cloud Control for 13c
- Oracle Enterprise Manager Cloud Control for 12c

### Topics

- [Prerequisites for Management Agent \(p. 1166\)](#)
- [Limitations for Management Agent \(p. 1168\)](#)
- [Option settings for Management Agent \(p. 1168\)](#)
- [Adding the Management Agent option \(p. 1170\)](#)
- [Using the Management Agent \(p. 1171\)](#)
- [Modifying Management Agent settings \(p. 1172\)](#)
- [Performing database tasks with the Management Agent \(p. 1172\)](#)
- [Removing the Management Agent option \(p. 1175\)](#)

## Prerequisites for Management Agent

To use Management Agent, ensure that you meet the following prerequisites.

### General prerequisites

Following are general prerequisites for using Management Agent:

- You need an Oracle Management Service (OMS) that is configured to connect to your Amazon RDS DB instance.
- In most cases, you must configure your VPC to allow connections from OMS to your DB instance. If you aren't familiar with Amazon Virtual Private Cloud (Amazon VPC), we recommend that you complete the steps in [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#) before continuing.
- Management Agent version 13.4.0.9.v1 requires OMS version 13.4.0.9 or later and patch 32198287.
- Ensure that you have sufficient storage space for your OEM release:
  - At least 8.5 GiB for OEM 13c Release 4
  - At least 8.5 GiB for OEM 13c Release 3
  - At least 5.5 GiB for OEM 13c Release 2
  - At least 4.5 GiB OEM 13c Release 1
  - At least 2.5 GiB for OEM 12c
- If you are using Management Agent versions `OEM_AGENT 13.2.0.0.v3` and `13.3.0.0.v2`, and if you want to use TCPS connectivity, follow the instructions in [Configuring third party CA certificates for communication with target databases](#) in the Oracle documentation. Also, update the JDK on your OMS by following the instructions in the Oracle document with the Oracle Doc ID 2241358.1. This step ensures that OMS supports all the cipher suites that the database supports.

**Note**

TCPS connectivity between the Management Agent and the DB instance is only supported for Management Agent versions OEM\_AGENT 13.2.0.0.v3 and 13.3.0.0.v2.

### Oracle Database release prerequisites

Following are the supported Oracle Database versions for each Management Agent version.

Management Agent version	Oracle Database 19c	Oracle Database 18c	Oracle Database 12c Release 2 (12.2)	Oracle Database 12c Release 1 (12.1)
13.4.0.9.v1	Supported	Supported	Supported	Supported
13.3.0.0.v2	Supported	Supported	Supported	Supported
13.3.0.0.v1	Supported	Supported	Supported	Supported
13.2.0.0.v3	Supported	Supported	Supported	Supported
13.2.0.0.v2	Supported	Supported	Supported	Supported
13.2.0.0.v1	Supported	Supported	Supported	Supported
13.1.0.0.v1	Supported	Supported	Supported	Supported
12.1.0.5.v1	Not supported	Supported	Supported	Supported
12.1.0.4.v1	Not supported	Supported	Supported	Supported

Following are prerequisites for different database versions:

- For an Amazon RDS DB instance running Oracle Database 19c (19.0.0.0), the minimum AGENT\_VERSION is 13.1.0.0.v1.
- For an Amazon RDS DB instance running Oracle Database 18c (18.0.0.0) or higher, meet the following requirements:
  - For OMS 13c2, apply the Enterprise Manager 13.2 Master Bundle Patch List, which includes plugins 13.2.1, 13.2.2, 13.2.3, 13.2.4 (Oracle Doc ID 2219797.1).
  - For OMS 13c2, apply the OMS PSU System Patch 28970534.
  - For OMS 13c2, apply the OMS-Side Plugin System 13.2.2.0.190131 Patch 29201709.
- For an Amazon RDS DB instance running Oracle Database Release 2 (12.2.0.1) or lower, meet the following requirements:
  - For OMS 13c Release 2 with Oracle patch 25163555 applied, use OEM Agent 13.2.0.0.v2 or later.  
Use OMSPatcher to apply the patch.
  - For unpatched OMS 13c Release 2, use OEM Agent 13.2.0.0.v1.

Use OMSPatcher to apply patches.

### OMS host communication prerequisites

Make sure that your OMS host and your Amazon RDS DB instance can communicate. Do the following:

- To connect from the Management Agent to your OMS, if your OMS is behind a firewall, add the IP addresses of your DB instances to your OMS.

Make sure the firewall for the OMS allows traffic from both the DB listener port (default 1521) and the OEM Agent port (default 3872), originating from the IP address of the DB instance.

- To connect from your OMS to the Management Agent, if your OMS has a publicly resolvable host name, add the OMS address to a security group. Your security group must have inbound rules that allow access to the DB listener port and the Management Agent port. For an example of creating a security and adding inbound rules, see [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#).
- To connect from your OMS to the Management Agent, if your OMS doesn't have a publicly resolvable host name, use one of the following:
  - If your OMS is hosted on an Amazon Elastic Compute Cloud (Amazon EC2) instance in a private VPC, you can set up VPC peering to connect from OMS to Management Agent. For more information, see [A DB instance in a VPC accessed by an EC2 instance in a different VPC \(p. 1760\)](#).
  - If your OMS is hosted on-premises, you can set up a VPN connection to allow access from OMS to Management Agent. For more information, see [A DB instance in a VPC accessed by a client application through the internet \(p. 1761\)](#) or [VPN connections](#).

## Limitations for Management Agent

Following are some limitations to using Management Agent:

- Administrative tasks such as job execution and database patching, that require host credentials, aren't supported.
- Host metrics and the process list aren't guaranteed to reflect the actual system state. Thus, you shouldn't use OEM to monitor the root file system or mount point file system. For more information about monitoring the operating system, see [Monitoring OS metrics using Enhanced Monitoring \(p. 477\)](#).
- Autodiscovery isn't supported. You must manually add database targets.
- OMS module availability depends on your database edition. For example, the database performance diagnosis and tuning module is only available for Oracle Database Enterprise Edition.
- Management Agent consumes additional memory and computing resources. If you experience performance problems after enabling the `OEM_AGENT` option, we recommend that you scale up to a larger DB instance class. For more information, see [DB instance classes \(p. 7\)](#) and [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- The user running the `OEM_AGENT` on the Amazon RDS host doesn't have operating system access to the alert log. Thus, you can't collect metrics for `DB Alert Log` and `DB Alert Log Error Status` in OEM.

## Option settings for Management Agent

Amazon RDS supports the following settings for the Management Agent option.

Option setting	Required	Valid values	Description
<code>Version</code> ( <code>AGENT_VERSION</code> )	Yes	13.4.0.9.v1 13.3.0.0.v2 13.3.0.0.v1 13.2.0.0.v3 13.2.0.0.v2	The version of the Management Agent software. The AWS CLI option name is <code>OptionVersion</code> . <p><b>Note</b> In the AWS GovCloud (US) Regions, 12.1 and 13.1 versions aren't available.</p>

Option setting	Required	Valid values	Description
		13.2.0.0.v1 13.1.0.0.v1 12.1.0.5.v1 12.1.0.4.v1	
<b>Port</b> (AGENT_PORT)	Yes	An integer value	The port on the DB instance that listens for the OMS host. The default is 3872. Your OMS host must belong to a security group that has access to this port.  The AWS CLI option name is <code>Port</code> .
<b>Security Groups</b>	Yes	Existing security groups	A security group that has access to <b>Port</b> . Your OMS host must belong to this security group.  The AWS CLI option name is <code>VpcSecurityGroupMemberships</code> or <code>DBSecurityGroupMemberships</code> .
<b>OMS_HOST</b>	Yes	A string value, for example <i>my.example.oms</i>	The publicly accessible host name or IP address of the OMS.  The AWS CLI option name is <code>OMS_HOST</code> .
<b>OMS_PORT</b>	Yes	An integer value	The HTTPS upload port on the OMS Host that listens for the Management Agent.  To determine the HTTPS upload port, connect to the OMS host, and run the following command (which requires the <code>SYSMAN</code> password): <code>emctl status oms -details</code>  The AWS CLI option name is <code>OMS_PORT</code> .
<b>AGENT_REGISTRATION_PASSWORD</b>	string value		The password that the Management Agent uses to authenticate itself with the OMS. We recommend that you create a persistent password in your OMS before enabling the <code>OEM_AGENT</code> option. With a persistent password you can share a single Management Agent option group among multiple Amazon RDS databases.  The AWS CLI option name is <code>AGENT_REGISTRATION_PASSWORD</code> .
<b>ALLOW_TLS_ONLY</b>	No	true, false (default)	A value that configures the OEM Agent to support only the <code>TLSv1</code> protocol while the agent listens as a server. This setting is only supported for 12.1 agent versions. Later agent versions only support Transport Layer Security (TLS) by default.

Option setting	Required	Valid values	Description
<b>MINIMUM_TLS_VERSION</b>		TLSSv1 (default), TLSSv1.2	A value that specifies the minimum TLS version supported by the OEM Agent while the agent listens as a server. This setting is only supported for agent versions 13.1.0.0.v1 and higher. Earlier agent versions only support the TLSSv1 setting.
<b>TLS_CIPHER_SUITE</b>		TLS_RSA_WITH_AES_128_CBC_SHA (Default supported by all agent versions)	A value that specifies the TLS cipher suite used by the OEM Agent while the agent listens as a server.
		TLS_RSA_WITH_AES_128_CBC_SHA256 (Requires version 13.1.0.0.v1 or above)	
		TLS_RSA_WITH_AES_256_CBC_SHA (Requires version 13.2.0.0.v3 or above)	
		TLS_RSA_WITH_AES_256_CBC_SHA256 (Requires version 13.2.0.0.v3 or above)	

## Adding the Management Agent option

The general process for adding the Management Agent option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

If you encounter errors, check [My Oracle Support](#) documents for information about resolving specific problems.

After you add the Management Agent option, you don't need to restart your DB instance. As soon as the option group is active, the OEM Agent is active.

If your OMS host is using an untrusted third-party certificate, Amazon RDS returns the following error.

You successfully installed the OEM\_AGENT option. Your OMS host is using an untrusted third party certificate.  
Configure your OMS host with the trusted certificates from your third party.

If this error is returned, the Management Agent option isn't enabled until the problem is corrected. For information about correcting the problem, see the [My Oracle Support](#) document [2202569.1](#).

## Console

### To add the Management Agent option to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine** choose the oracle edition for your DB instance.
  - b. For **Major engine version** choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **OEM\_AGENT** option to the option group, and configure the option settings. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#). For more information about each setting, see [Option settings for Management Agent \(p. 1168\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## AWS CLI

The following example uses the AWS CLI `add-option-to-option-group` command to add the **OEM\_AGENT** option to an option group called `myoptiongroup`.

For Linux, macOS, or Unix:

```
aws rds add-option-to-option-group \
 --option-group-name "myoptiongroup" \
 --options
 OptionName=OEM_AGENT,OptionVersion=13.1.0.0.v1,Port=3872,VpcSecurityGroupMemberships=sg-1234567890,Opt
 {Name=OMS_PORT,Value=4903},{Name=AGENT_REGISTRATION_PASSWORD,Value=password}] \
 --apply-immediately
```

For Windows:

```
aws rds add-option-to-option-group ^
 --option-group-name "myoptiongroup" ^
 --options
 OptionName=OEM_AGENT,OptionVersion=13.1.0.0.v1,Port=3872,VpcSecurityGroupMemberships=sg-1234567890,Opt
 {Name=OMS_PORT,Value=4903},{Name=AGENT_REGISTRATION_PASSWORD,Value=password}] ^
 --apply-immediately
```

## Using the Management Agent

After you enable the Management Agent option, take the following steps to begin using it.

### To use the Management Agent

1. Unlock and reset the DBSNMP account credential. Do this by running the following code on your target database on your DB instance and using your master user account.

```
ALTER USER dbsnmp IDENTIFIED BY new_password ACCOUNT UNLOCK;
```

2. Add your targets to the OMS console manually:
  - a. In your OMS console, choose **Setup, Add Target, Add Targets Manually**.
  - b. Choose **Add Targets Declaratively by Specifying Target Monitoring Properties**.
  - c. For **Target Type**, choose **Database Instance**.
  - d. For **Monitoring Agent**, choose the agent with the identifier that is the same as your RDS DB instance identifier.
  - e. Choose **Add Manually**.
  - f. Enter the endpoint for the Amazon RDS DB instance, or choose it from the host name list. Make sure that the specified host name matches the endpoint of the Amazon RDS DB instance.  
For information about finding the endpoint for your Amazon RDS DB instance, see [Finding the endpoint of your Oracle DB instance \(p. 1013\)](#).
  - g. Specify the following database properties:
    - For **Target name**, enter a name.
    - For **Database system name**, enter a name.
    - For **Monitor username**, enter **dbsnmp**.
    - For **Monitor password**, enter the password from step 1.
    - For **Role**, enter **normal**.
    - For **Oracle home path**, enter **/oracle**.
    - For **Listener Machine name**, the agent identifier already appears.
    - For **Port**, enter the database port. The RDS default port is 1521.
    - For **Database name**, enter the name of your database.
  - h. Choose **Test Connection**.
  - i. Choose **Next**. The target database appears in your list of monitored resources.

## Modifying Management Agent settings

After you enable the Management Agent, you can modify settings for the option. For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#). For more information about each setting, see [Option settings for Management Agent \(p. 1168\)](#).

## Performing database tasks with the Management Agent

You can use Amazon RDS procedures to run certain EMCTL commands on the Management Agent. By running these procedures, you can do the tasks listed following.

### Note

Tasks are executed asynchronously.

### Tasks

- [Getting the status of the Management Agent \(p. 1173\)](#)
- [Restarting the Management Agent \(p. 1173\)](#)
- [Listing the targets monitored by the Management Agent \(p. 1173\)](#)
- [Listing the collection threads monitored by the Management Agent \(p. 1173\)](#)
- [Clearing the Management Agent state \(p. 1174\)](#)
- [Making the Management Agent upload its OMS \(p. 1174\)](#)
- [Pinging the OMS \(p. 1174\)](#)
- [Viewing the status of an ongoing task \(p. 1174\)](#)

## Getting the status of the Management Agent

To get the status of the Management Agent, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.get_status_oem_agent`. This procedure is equivalent to the `emctl status agent` command.

The following procedure creates a task to get the Management Agent's status and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.get_status_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Restarting the Management Agent

To restart the Management Agent, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.get_status_oem_agent`. This procedure is equivalent to running the `emctl stop agent` and `emctl start agent` commands.

The following procedure creates a task to restart the Management Agent and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.restart_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Listing the targets monitored by the Management Agent

To list the targets monitored by the Management Agent, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.list_targets_oem_agent`. This procedure is equivalent to running the `emctl config agent listtargets` command.

The following procedure creates a task to list the targets monitored by the Management Agent and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.list_targets_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Listing the collection threads monitored by the Management Agent

To list of all the running, ready, and scheduled collection threads monitored by the Management Agent, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.list_clxn_threads_oem_agent`. This procedure is equivalent to the `emctl status agent scheduler` command.

The following procedure creates a task to list the collection threads and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.list_clxn_threads_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Clearing the Management Agent state

To clear the Management Agent's state, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.clearstate_oem_agent`. This procedure is equivalent to running the `emctl clearstate agent` command.

The following procedure creates a task that clears the Management Agent's state and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.clearstate_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Making the Management Agent upload its OMS

To make the Management Agent upload the Oracle Management Server (OMS) associated with it, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.upload_oem_agent`. This procedure is equivalent to running the `emctl upload agent` command.

The following procedure creates a task that makes the Management Agent upload its associated OMS and return the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.upload_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Pinging the OMS

To ping the Management Agent's OMS, run the Amazon RDS procedure `rdsadmin.rdsadmin_oem_agent_tasks.ping_oms_oem_agent`. This procedure is equivalent to running the `emctl pingOMS` command.

The following procedure creates a task that pings the Management Agent's OMS and returns the ID of the task.

```
SELECT rdsadmin.rdsadmin_oem_agent_tasks.ping_oms_oem_agent() as TASK_ID from DUAL;
```

To view the result by displaying the task's output file, see [Viewing the status of an ongoing task \(p. 1174\)](#).

## Viewing the status of an ongoing task

You can view the status of an ongoing task in a bdump file. The bdump files are located in the `/rdsdbdata/log/trace` directory. Each bdump file name is in the following format.

```
dbtask-task-id.log
```

When you want to monitor a task, replace `task-id` with the ID of the task that you want to monitor.

To view the contents of bdump files, run the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`. The following query returns the contents of the `dbtask-1546988886389-2444.log` bdump file.

```
SELECT text FROM
 table(rdsadmin.rds_file_util.read_text_file('BDUMP','dbtask-1546988886389-2444.log'));
```

For more information about the Amazon RDS procedure `rdsadmin.rds_file_util.read_text_file`, see [Reading files in a DB instance directory \(p. 1109\)](#).

## Removing the Management Agent option

You can remove the OEM Agent from a DB instance. After you remove the OEM Agent, you don't need to restart your DB instance.

To remove the OEM Agent from a DB instance, do one of the following:

- Remove the OEM Agent option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- Modify the DB instance and specify a different option group that doesn't include the OEM Agent option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Java virtual machine

Amazon RDS supports Oracle Java Virtual Machine (JVM) through the use of the `JVM` option. Oracle Java provides a SQL schema and functions that facilitate Oracle Java features in an Oracle database. For more information, see [Introduction to Java in Oracle database](#) in the Oracle documentation.

You can use Oracle JVM with the following Oracle Database versions:

- Oracle Database 19c (19.0.0.0), all versions
- Oracle Database 18c (18.0.0.0), all versions
- Oracle Database 12c Release 2 (12.2), all versions
- Oracle Database 12c Release 1 (12.1), version 12.1.0.2.v13 or later

Java implementation in Amazon RDS has a limited set of permissions. The master user is granted the `RDS_JAVA_ADMIN` role, which grants a subset of the privileges granted by the `JAVA_ADMIN` role. To list the privileges granted to the `RDS_JAVA_ADMIN` role, run the following query on your DB instance:

```
SELECT * FROM dba_java_policy
 WHERE grantee IN ('RDS_JAVA_ADMIN', 'PUBLIC')
 AND enabled = 'ENABLED'
 ORDER BY type_name, name, grantee;
```

## Prerequisites for Oracle JVM

The following are prerequisites for using Oracle Java:

- Your DB instance must be inside a virtual private cloud (VPC). For more information, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).
- Your DB instance must be of a large enough class. Oracle Java isn't supported for the `db.t3.micro` or `db.t3.small` DB instance classes. For more information, see [DB instance classes \(p. 7\)](#).
- Your DB instance must have **Auto Minor Version Upgrade** enabled. This option enables your DB instance to receive minor DB engine version upgrades automatically when they become available. Amazon RDS uses this option to update your DB instance to the latest Oracle Patch Set Update (PSU) or Release Update (RU). For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Best practices for Oracle JVM

The following are best practices for using Oracle Java:

- For maximum security, use the `JVM` option with Secure Sockets Layer (SSL). For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).
- Configure your DB instance to restrict network access. For more information, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#) and [Working with a DB instance in a VPC \(p. 1765\)](#).
- Update the configuration of your HTTPS endpoints to support TLSv1.2 if you meet the following conditions:
  - You use Oracle Java Virtual Machine (JVM) to connect an HTTPS endpoint over TLSv1 or TLSv1.1 protocols.
  - Your endpoint doesn't support the TLSv1.2 protocol.
  - You haven't applied the April 2021 release update to your Oracle DB.

By updating your endpoint configuration, you ensure that the connectivity of the JVM to the HTTPS endpoint will continue to work. For more information about TLS changes in the Oracle JRE and JDK, see [Oracle JRE and JDK Cryptographic Roadmap](#).

## Adding the Oracle JVM option

The following is the general process for adding the **JVM** option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

There is a brief outage while the **JVM** option is added. After you add the option, you don't need to restart your DB instance. As soon as the option group is active, Oracle Java is available.

### Note

During this outage, password verification functions are disabled briefly. You can also expect to see events related to password verification functions during the outage. Password verification functions are enabled again before the Oracle DB instance is available.

### To add the JVM option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - For **Engine**, choose the DB engine used by the DB instance (**oracle-ee**, **oracle-se**, **oracle-se1**, or **oracle-se2**).
  - For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **JVM** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
4. Grant the required permissions to users.

The Amazon RDS master user has the permissions to use the **JVM** option by default. If other users require these permissions, connect to the DB instance as the master user in a SQL client and grant the permissions to the users.

The following example grants the permissions to use the **JVM** option to the `test_proc` user.

```
create user test_proc identified by password;
CALL dbms_java.grant_permission('TEST_PROC',
 'oracle.aurora.security.JServerPermission', 'LoadClassInPackage.*', '');
```

After the user is granted the permissions, the following query should return output.

```
select * from dba_java_policy where grantee='TEST_PROC';
```

### Note

The Oracle user name is case-sensitive, and it usually has all uppercase characters.

## Removing the Oracle JVM option

You can remove the `JVM` option from a DB instance. There is a brief outage while the option is removed. After you remove the `JVM` option, you don't need to restart your DB instance.

### Warning

Removing the `JVM` option can result in data loss if the DB instance is using data types that were enabled as part of the option. Back up your data before proceeding. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

To remove the `JVM` option from a DB instance, do one of the following:

- Remove the `JVM` option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- Modify the DB instance and specify a different option group that doesn't include the `JVM` option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Label Security

Amazon RDS supports Oracle Label Security for the Enterprise Edition of Oracle Database 12c through the use of the OLS option.

Most database security controls access at the object level. Oracle Label Security provides fine-grained control of access to individual table rows. For example, you can use Label Security to enforce regulatory compliance with a policy-based administration model. You can use Label Security policies to control access to sensitive data, and restrict access to only users with the appropriate clearance level. For more information, see [Introduction to Oracle Label Security](#) in the Oracle documentation.

**Important**

For Oracle Database 19c, Oracle Database 18c, and Oracle Database 12c Release 2 (12.2) on Amazon RDS, Oracle Label Security is a permanent and persistent option. You can't remove Oracle Label Security from an Oracle Database 19c, Oracle Database 18c, or Oracle Database 12c Release 2 (12.2) DB instance.

## Prerequisites for Oracle Label Security

The following are prerequisites for using Oracle Label Security:

- Your DB instance must use the Bring Your Own License model. For more information, see [Oracle licensing options \(p. 1000\)](#).
- You must have a valid license for Oracle Enterprise Edition with Software Update License and Support.
- Your Oracle license must include the Label Security option.
- You must be using the non-multitenant database architecture rather than the single-tenant architecture. For more information, see [RDS for Oracle architecture \(p. 1004\)](#).

## Adding the Oracle Label Security option

The general process for adding the Oracle Label Security option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

After you add the Label Security option, as soon as the option group is active, Label Security is active.

### To add the label security option to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose **oracle-ee**.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **OLS** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).

**Important**

If you add Label Security to an existing option group that is already attached to one or more DB instances, all the DB instances are restarted.

3. Apply the option group to a new or existing DB instance:

- For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. When you add the Label Security option to an existing DB instance, a brief outage occurs while your DB instance is automatically restarted. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Using Oracle Label Security

To use Oracle Label Security, you create policies that control access to specific rows in your tables. For more information, see [Creating an Oracle Label Security policy](#) in the Oracle documentation.

When you work with Label Security, you perform all actions as the LBAC\_DBA role. The master user for your DB instance is granted the LBAC\_DBA role. You can grant the LBAC\_DBA role to other users so that they can administer Label Security policies.

For Amazon RDS for Oracle Database 19c, Oracle Database 18c, and Oracle Database 12c Release 2 (12.2) DB instances, you must grant access to the OLS\_ENFORCEMENT package to any new users who require access to Oracle Label Security. To grant access to the OLS\_ENFORCEMENT package, connect to the DB instance as the master user and run the following SQL statement:

```
GRANT ALL ON LBACSYS.OLS_ENFORCEMENT TO username;
```

You can configure Label Security through the Oracle Enterprise Manager (OEM) Cloud Control. Amazon RDS supports the OEM Cloud Control through the Management Agent option. For more information, see [Oracle Management Agent for Enterprise Manager Cloud Control \(p. 1166\)](#).

## Removing the Oracle Label Security option

You can remove Oracle Label Security from a DB instance.

To remove Label Security from a DB instance, do one of the following:

- To remove Label Security from multiple DB instances, remove the Label Security option from the option group they belong to. This change affects all DB instances that use the option group. When you remove Label Security from an option group that is attached to multiple DB instances, all the DB instances are restarted. For more information, see [Removing an option from an option group \(p. 225\)](#).
- To remove Label Security from a single DB instance, modify the DB instance and specify a different option group that doesn't include the Label Security option. You can specify the default (empty) option group, or a different custom option group. When you remove the Label Security option, a brief outage occurs while your DB instance is automatically restarted. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Troubleshooting

The following are issues you might encounter when you use Oracle Label Security.

Issue	Troubleshooting suggestions
When you try to create a policy, you see an error message similar to the following: insufficient authorization for the SYSDBA package.	A known issue with Oracle's Label Security feature prevents users with usernames of 16

Issue	Troubleshooting suggestions
	or 24 characters from running Label Security commands. You can create a new user with a different number of characters, grant LBAC_DB to the new user, log in as the new user, and run the OLS commands as the new user. For additional information, please contact Oracle support.

## Oracle Locator

Amazon RDS supports Oracle Locator through the use of the `LOCATOR` option. Oracle Locator provides capabilities that are typically required to support internet and wireless service-based applications and partner-based GIS solutions. Oracle Locator is a limited subset of Oracle Spatial. For more information, see [Oracle Locator](#) in the Oracle documentation.

### Important

If you use Oracle Locator, Amazon RDS automatically updates your DB instance to the latest Oracle PSU if there are security vulnerabilities with a Common Vulnerability Scoring System (CVSS) score of 9+ or other announced security vulnerabilities.

Amazon RDS supports Oracle Locator for the following versions of Oracle Database:

- Oracle Database 19c (19.0.0.0)
- Oracle Database 18c (18.0.0.0)
- Oracle Database 12c Release 2 (12.2.0.1)
- Oracle Database 12c Release 1 (12.1), version 12.1.0.2.v13 or later

## Prerequisites for Oracle Locator

The following are prerequisites for using Oracle Locator:

- Your DB instance must be inside a virtual private cloud (VPC). For more information, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).
- Your DB instance must be of sufficient class. Oracle Locator is not supported for the `db.t3.micro` or `db.t3.small` DB instance classes. For more information, see [RDS for Oracle instance classes \(p. 1002\)](#).
- Your DB instance must have **Auto Minor Version Upgrade** enabled. This option enables your DB instance to receive minor DB engine version upgrades automatically when they become available and is required for any options that install the Oracle Java Virtual Machine (JVM). Amazon RDS uses this option to update your DB instance to the latest Oracle Patch Set Update (PSU) or Release Update (RU). For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Best practices for Oracle Locator

The following are best practices for using Oracle Locator:

- For maximum security, use the `LOCATOR` option with Secure Sockets Layer (SSL). For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).
- Configure your DB instance to restrict access to your DB instance. For more information, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#) and [Working with a DB instance in a VPC \(p. 1765\)](#).

## Adding the Oracle Locator option

The following is the general process for adding the `LOCATOR` option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the `LOCATOR` option is added. There is no outage if Oracle Java Virtual Machine (JVM) is already installed

on the DB instance. After you add the option, you don't need to restart your DB instance. As soon as the option group is active, Oracle Locator is available.

**Note**

During this outage, password verification functions are disabled briefly. You can also expect to see events related to password verification functions during the outage. Password verification functions are enabled again before the Oracle DB instance is available.

### To add the **LOCATOR** option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose the oracle edition for your DB instance.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).
2. Add the **LOCATOR** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Using Oracle Locator

After you enable the Oracle Locator option, you can begin using it. You should only use Oracle Locator features. Don't use any Oracle Spatial features unless you have a license for Oracle Spatial.

For a list of features that are supported for Oracle Locator, see [Features Included with Locator](#) in the Oracle documentation.

For a list of features that are not supported for Oracle Locator, see [Features Not Included with Locator](#) in the Oracle documentation.

## Removing the Oracle Locator option

After you drop all objects that use data types provided by the **LOCATOR** option, you can remove the option from a DB instance. If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the **LOCATOR** option is removed. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you remove the **LOCATOR** option, you don't need to restart your DB instance.

### To drop the **LOCATOR** option

1. Back up your data.

**Warning**

If the instance uses data types that were enabled as part of the option, and if you remove the **LOCATOR** option, you can lose data. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

2. Check whether any existing objects reference data types or features of the **LOCATOR** option.

If LOCATOR options exist, the instance can get stuck when applying the new option group that doesn't have the LOCATOR option. You can identify the objects by using the following queries:

```
SELECT OWNER, SEGMENT_NAME, TABLESPACE_NAME, BYTES/1024/1024 mbytes
FROM DBA_SEGMENTS
WHERE SEGMENT_TYPE LIKE '%TABLE%'
AND (OWNER, SEGMENT_NAME) IN
 (SELECT DISTINCT OWNER, TABLE_NAME
 FROM DBA_TAB_COLUMNS
 WHERE DATA_TYPE='SDO_GEOGRAPHY'
 AND OWNER <> 'MDSYS')
ORDER BY 1,2,3,4;

SELECT OWNER, TABLE_NAME, COLUMN_NAME
FROM DBA_TAB_COLUMNS
WHERE DATA_TYPE = 'SDO_GEOGRAPHY'
AND OWNER <> 'MDSYS'
ORDER BY 1,2,3;
```

3. Drop any objects that reference data types or features of the LOCATOR option.
4. Do one of the following:
  - Remove the LOCATOR option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
  - Modify the DB instance and specify a different option group that doesn't include the LOCATOR option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Multimedia

Amazon RDS supports Oracle Multimedia through the use of the `MULTIMEDIA` option. You can use Oracle Multimedia to store, manage, and retrieve images, audio, video, and other heterogeneous media data. For more information, see [Oracle Multimedia](#) in the Oracle documentation.

### Important

If you use Oracle Multimedia, Amazon RDS automatically updates your DB instance to the latest Oracle PSU if there are security vulnerabilities with a Common Vulnerability Scoring System (CVSS) score of 9+ or other announced security vulnerabilities.

Amazon RDS supports Oracle Multimedia for the following editions and versions of Oracle:

- Standard Edition (SE2) or Enterprise Edition of Oracle Database 18c (18.0.0.0), all versions
- Standard Edition (SE2) or Enterprise Edition of Oracle Database 12c Release 2 (12.2), all versions
- Standard Edition (SE2) or Enterprise Edition of Oracle Database 12c Release 1 (12.1), version 12.1.0.2.v13 or later

### Note

Oracle desupported Oracle Multimedia in Oracle Database 19c. So, Oracle Multimedia isn't supported for Oracle Database 19c DB instances. For more information, see [Desupport of Oracle Multimedia](#) in the Oracle documentation.

## Prerequisites for Oracle Multimedia

The following are prerequisites for using Oracle Multimedia:

- Your DB instance must be inside a virtual private cloud (VPC). For more information, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).
- Your DB instance must be of sufficient class. Oracle Multimedia is not supported for the `db.t3.micro` or `db.t3.small` DB instance classes. For more information, see [RDS for Oracle instance classes \(p. 1002\)](#).
- Your DB instance must have **Auto Minor Version Upgrade** enabled. This option enables your DB instance to receive minor DB engine version upgrades automatically when they become available and is required for any options that install the Oracle Java Virtual Machine (JVM). Amazon RDS uses this option to update your DB instance to the latest Oracle Patch Set Update (PSU) or Release Update (RU). For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Best practices for Oracle Multimedia

The following are best practices for using Oracle Multimedia:

- For maximum security, use the `MULTIMEDIA` option with Secure Sockets Layer (SSL). For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).
- Configure your DB instance to restrict access to your DB instance. For more information, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#) and [Working with a DB instance in a VPC \(p. 1765\)](#).

## Adding the Oracle Multimedia option

The following is the general process for adding the `MULTIMEDIA` option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.

3. Associate the option group with the DB instance.

If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the **MULTIMEDIA** option is added. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you add the option, you don't need to restart your DB instance. As soon as the option group is active, Oracle Multimedia is available.

**Note**

During this outage, password verification functions are disabled briefly. You can also expect to see events related to password verification functions during the outage. Password verification functions are enabled again before the Oracle DB instance is available.

### To add the **MULTIMEDIA** option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:

- a. For **Engine**, choose **oracle-ee**.
- b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **MULTIMEDIA** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Removing the Oracle Multimedia option

After you drop all objects that use data types provided by the **MULTIMEDIA** option, you can remove the option from a DB instance. If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the **MULTIMEDIA** option is removed. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you remove the **MULTIMEDIA** option, you don't need to restart your DB instance.

### To drop the **MULTIMEDIA** option

1. Back up your data.

**Warning**

If the instance uses data types that were enabled as part of the option, and if you remove the **MULTIMEDIA** option, you can lose data. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

2. Check whether any existing objects reference data types or features of the **MULTIMEDIA** option.
3. Drop any objects that reference data types or features of the **MULTIMEDIA** option.
4. Do one of the following:
  - Remove the **MULTIMEDIA** option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).

- Modify the DB instance and specify a different option group that doesn't include the **MULTIMEDIA** option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle native network encryption

Amazon RDS supports Oracle native network encryption (NNE). With native network encryption, you can encrypt data as it moves to and from a DB instance. Amazon RDS supports NNE for all editions of Oracle.

A detailed discussion of Oracle native network encryption is beyond the scope of this guide, but you should understand the strengths and weaknesses of each algorithm and key before you decide on a solution for your deployment. For information about the algorithms and keys that are available through Oracle native network encryption, see [Configuring network data encryption](#) in the Oracle documentation. For more information about AWS security, see the [AWS security center](#).

**Note**

You can use Native Network Encryption or Secure Sockets Layer, but not both. For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).

## NNE option settings

Amazon RDS supports the following settings for the NNE option.

**Note**

When you use commas to separate values for an option setting, don't put a space after the comma.

Option setting	Valid values	Default value	Description
<b>SQLNET.ENCRYPTION_SERVER</b>	Rejected, Requested, Required	Requested	The encryption behavior when a client, or a server acting as a client, connects to the DB instance. Requested indicates that the DB instance does not require traffic from the client to be encrypted.
<b>SQLNET.CRYPTO_CHECKSUM_SERVER</b>	Rejected, Requested, Required	Requested	The data integrity behavior when a client, or a server acting as a client, connects to the DB instance. Requested indicates that the DB instance does not require the client to perform a checksum.
<b>SQLNET.ENCRYPTION_TYPES_SERVER</b>	AES256, AES192, AES128, 3DES168, RC4_128, AES128, 3DES112, RC4_56, DES, RC4_40, DES40	AES256, 3DES168, RC4_128, AES128, 3DES112, RC4_56, DES, RC4_40, DES40	A list of encryption algorithms used by the DB instance. The DB instance uses each algorithm, in order, to attempt to decrypt the client input until an algorithm succeeds or until the end of the list is reached. Amazon RDS uses the following default list from Oracle. You can change the order or limit the algorithms that the DB instance will accept. 1. RC4_256: RSA RC4 (256-bit key size)

Option setting	Valid values	Default value	Description
			<p>2. AES256: AES (256-bit key size)      3. AES192: AES (192-bit key size)      4. 3DES168: 3-key Triple-DES (112-bit effective key size)      5. RC4_128: RSA RC4 (128-bit key size)      6. AES128: AES (128-bit key size)      7. 3DES112: 2-key Triple-DES (80-bit effective key size)      8. RC4_56: RSA RC4 (56-bit key size)      9. DES: Standard DES (56-bit key size)      10. RC4_40: RSA RC4 (40-bit key size)      11. DES40: DES40 (40-bit key size)</p> <p>You can specify either one value or a comma-separated list of values. If you use a comma, don't insert a space after the comma; otherwise, you receive an <code>InvalidParameterValue</code> error.</p>
<b>SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER</b>	SHA512, SHA1, SHA384, SHA512, SHA1, MD5	MD5	<p>A list of checksum algorithms.</p> <p>You can specify either one value or a comma-separated list of values. If you use a comma, don't insert a space after the comma; otherwise, you receive an <code>InvalidParameterValue</code> error.</p>

## Adding the NNE option

The general process for adding the NNE option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

After you add the NNE option, as soon as the option group is active, NNE is active.

### To add the NNE option to a DB instance

1. For **Engine**, choose the Oracle edition that you want to use. NNE is supported on all editions.
  2. For **Major engine version**, choose the version of your DB instance.
- For more information, see [Creating an option group \(p. 215\)](#).
3. Add the **NNE** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).

**Note**

After you add the NNE option, you don't need to restart your DB instances. As soon as the option group is active, NNE is active.

4. Apply the option group to a new or existing DB instance:

- For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. After you add the NNE option, you don't need to restart your DB instance. As soon as the option group is active, NNE is active. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Using NNE

With Oracle native network encryption, you can also specify network encryption on the client side. On the client (the computer used to connect to the DB instance), you can use the sqlnet.ora file to specify the following client settings: SQLNET.CRYPTO\_CHECKSUM\_CLIENT, SQLNET.CRYPTO\_CHECKSUM\_TYPES\_CLIENT, SQLNET.ENCRYPTION\_CLIENT, and SQLNET.ENCRYPTION\_TYPES\_CLIENT. For information, see [Configuring network data encryption and integrity for Oracle servers and clients](#) in the Oracle documentation.

Sometimes, the DB instance will reject a connection request from an application, for example, if there is a mismatch between the encryption algorithms on the client and on the server.

To test Oracle native network encryption, add the following lines to the sqlnet.ora file on the client:

```
DIAG_ADR_ENABLED=off
TRACE_DIRECTORY_CLIENT=/tmp
TRACE_FILE_CLIENT=nettrace
TRACE_LEVEL_CLIENT=16
```

These lines generate a trace file on the client called `/tmp/nettrace*` when the connection is attempted. The trace file contains information on the connection. For more information about connection-related issues when you are using Oracle Native Network Encryption, see [About negotiating encryption and integrity](#) in the Oracle documentation.

## Modifying NNE settings

After you enable NNE, you can modify settings for the option. For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#). For more information about each setting, see [NNE option settings \(p. 1188\)](#).

## Removing the NNE option

You can remove NNE from a DB instance.

To remove NNE from a DB instance, do one of the following:

- To remove NNE from multiple DB instances, remove the NNE option from the option group they belong to. This change affects all DB instances that use the option group. After you remove the NNE option, you don't need to restart your DB instances. For more information, see [Removing an option from an option group \(p. 225\)](#).
- To remove NNE from a single DB instance, modify the DB instance and specify a different option group that doesn't include the NNE option. You can specify the default (empty) option group, or a different

custom option group. After you remove the NNE option, you don't need to restart your DB instance. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle OLAP

Amazon RDS supports Oracle OLAP through the use of the `OLAP` option. This option provides On-line Analytical Processing (OLAP) for Oracle DB instances. You can use Oracle OLAP to analyze large amounts of data by creating dimensional objects and cubes in accordance with the OLAP standard. For more information, see [the Oracle documentation](#).

### Important

If you use Oracle OLAP, Amazon RDS automatically updates your DB instance to the latest Oracle PSU if there are security vulnerabilities with a Common Vulnerability Scoring System (CVSS) score of 9+ or other announced security vulnerabilities.

Amazon RDS supports Oracle OLAP for the following editions and versions of Oracle:

- Oracle Database 19c Enterprise Edition, all versions
- Oracle Database 18c Enterprise Edition, all versions
- Oracle Database 12c Release 2 (12.2.0.1) Enterprise Edition, all versions
- Oracle Database 12c Release 1 (12.1.0.2) Enterprise Edition, version 12.1.0.2.v13 or later

## Prerequisites for Oracle OLAP

The following are prerequisites for using Oracle OLAP:

- You must have an Oracle OLAP license from Oracle. For more information, see [Licensing Information](#) in the Oracle documentation.
- Your DB instance must be inside a virtual private cloud (VPC). For more information, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).
- Your DB instance must be of a sufficient instance class. Oracle OLAP isn't supported for the `db.t3.micro` or `db.t3.small` DB instance classes. For more information, see [RDS for Oracle instance classes \(p. 1002\)](#).
- Your DB instance must have **Auto Minor Version Upgrade** enabled. This option enables your DB instance to receive minor DB engine version upgrades automatically when they become available and is required for any options that install the Oracle Java Virtual Machine (JVM). Amazon RDS uses this option to update your DB instance to the latest Oracle Patch Set Update (PSU) or Release Update (RU). For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- Your DB instance must not have a user named `OLAPSYS`. If it does, the OLAP option installation fails.

## Best practices for Oracle OLAP

The following are best practices for using Oracle OLAP:

- For maximum security, use the `OLAP` option with Secure Sockets Layer (SSL). For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).
- Configure your DB instance to restrict access to your DB instance. For more information, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#) and [Working with a DB instance in a VPC \(p. 1765\)](#).

## Adding the Oracle OLAP option

The following is the general process for adding the `OLAP` option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.

3. Associate the option group with the DB instance.

If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the OLAP option is added. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you add the option, you don't need to restart your DB instance. As soon as the option group is active, Oracle OLAP is available.

### To add the OLAP option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - For **Engine**, choose the Oracle edition for your DB instance.
  - For **Major engine version**, choose the version of your DB instance.For more information, see [Creating an option group \(p. 215\)](#).
2. Add the **OLAP** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Using Oracle OLAP

After you enable the Oracle OLAP option, you can begin using it. For a list of features that are supported for Oracle OLAP, see [the Oracle documentation](#).

## Removing the Oracle OLAP option

After you drop all objects that use data types provided by the OLAP option, you can remove the option from a DB instance. If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the OLAP option is removed. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you remove the OLAP option, you don't need to restart your DB instance.

### To drop the OLAP option

1. Back up your data.

#### Warning

If the instance uses data types that were enabled as part of the option, and if you remove the OLAP option, you can lose data. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

2. Check whether any existing objects reference data types or features of the OLAP option.
3. Drop any objects that reference data types or features of the OLAP option.
4. Do one of the following:
  - Remove the OLAP option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).

- Modify the DB instance and specify a different option group that doesn't include the OLAP option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Secure Sockets Layer

You enable Secure Sockets Layer (SSL) encryption for an Oracle DB instance by adding the Oracle SSL option to the option group associated with an Oracle DB instance. You specify the port you want to communicate over using SSL. You must configure SQL\*Plus as shown in this following section.

You enable SSL encryption for an Oracle DB instance by adding the Oracle SSL option to the option group associated with the DB instance. Amazon RDS uses a second port, as required by Oracle, for SSL connections. This approach allows both clear text and SSL-encrypted communication to occur at the same time between a DB instance and SQL\*Plus. For example, you can use the port with clear text communication to communicate with other resources inside a VPC while using the port with SSL-encrypted communication to communicate with resources outside the VPC.

**Note**

You can use Secure Sockets Layer or Native Network Encryption, but not both. For more information, see [Oracle native network encryption \(p. 1188\)](#).

You can use SSL encryption with the following Oracle database versions and editions:

- 19.0.0.0: All versions, all editions including Standard Edition Two
- 18.0.0.0: All versions, all editions including Standard Edition Two
- 12.2.0.1: All versions, all editions including Standard Edition Two
- 12.1.0.2: All versions, all editions including Standard Edition Two

**Note**

You cannot use both SSL and Oracle native network encryption (NNE) on the same instance. If you use SSL encryption, you must disable any other connection encryption.

## TLS versions for the Oracle SSL option

Amazon RDS for Oracle supports Transport Layer Security (TLS) versions 1.0 and 1.2. To use the Oracle SSL option, use the `SQLNET.SSL_VERSION` option setting. The following values are allowed for this option setting:

- "1.0" – Clients can connect to the DB instance using TLS 1.0 only.
- "1.2" – Clients can connect to the DB instance using TLS 1.2 only.
- "1.2 or 1.0" – Clients can connect to the DB instance using either TLS 1.2 or 1.0.

To use the Oracle SSL option, the `SQLNET.SSL_VERSION` option setting is also required:

- For existing Oracle SSL options, `SQLNET.SSL_VERSION` is set to "1.0" automatically. You can change the setting if necessary.
- When you add a new Oracle SSL option, you must set `SQLNET.SSL_VERSION` explicitly to a valid value.

The following table shows the TLS option settings that are supported for different Oracle engine versions and editions.

Oracle engine version	SQLNET.SSL_VERSION = "1.0"	SQLNET.SSL_VERSION = "1.2"	SQLNET.SSL_VERSION = "1.2 or 1.0"
19.0.0.0 (All editions)	Supported	Supported	Supported
18.0.0.0 (All editions)	Supported	Supported	Supported
12.2.0.1 (All editions)	Supported	Supported	Supported
12.1.0.2 (All editions)	Supported	Supported	Supported

## Cipher suites for the Oracle SSL option

Amazon RDS for Oracle supports multiple SSL cipher suites. By default, the Oracle SSL option is configured to use the `SSL_RSA_WITH_AES_256_CBC_SHA` cipher suite. To specify a different cipher suite to use over SSL connections, use the `SQLNET.CIPHER_SUITE` option setting. Following are the allowed values for this option setting:

- `"SSL_RSA_WITH_AES_256_CBC_SHA"` – The default setting, which is compatible with TLS 1.0 and TLS 1.2
- `"SSL_RSA_WITH_AES_256_CBC_SHA256"` – Only compatible with TLS 1.2
- `"SSL_RSA_WITH_AES_256_GCM_SHA384"` – Only compatible with TLS 1.2

For existing Oracle SSL options, `SQLNET.CIPHER_SUITE` is set to `"SSL_RSA_WITH_AES_256_CBC_SHA"` automatically. You can change the setting if necessary.

The following table shows the cipher suite option settings that are supported for different Oracle engine versions and editions.

Oracle engine version	SQLNET.CIPHER_SUITE = "SSL_RSA_WITH_AES_256_GCM_SHA384"	SQLNET.CIPHER_SUITE = "SSL_RSA_WITH_AES_256_CBC_SHA256"	SQLNET.CIPHER_SUITE = "SSL_RSA_WITH_AES_256_CBC_SHA"
19.0.0.0 (All editions)	Supported	Supported	Supported
18.0.0.0 (All editions)	Supported	Supported	Supported
12.2.0.1 (All editions)	Supported	Supported	Supported
12.1.0.2 (All editions)	Supported	Supported	Supported

## FIPS support

Amazon RDS for Oracle enables you to use the Federal Information Processing Standard (FIPS) standard for 140-2. FIPS 140-2 is a United States government standard that defines cryptographic module security requirements. You enable the FIPS standard by setting the setting `FIPS.SSLFIPS_140` to `TRUE` for the Oracle SSL option. When FIPS 140-2 is configured for SSL, the cryptographic libraries are designed to encrypt data between the client and the Oracle DB instance.

You can enable the FIPS setting with the following Oracle database versions and editions:

- 19.0.0.0: All versions, all editions including Standard Edition Two
- 18.0.0.0: All versions, all editions including Standard Edition Two
- 12.2.0.1: All versions, all editions including Standard Edition Two

- 12.1.0.2: Version 2 and later, all editions including Standard Edition Two

Clients must use the cipher suite that is FIPS-compliant. When establishing a connection, the client and Oracle DB instance negotiate which cipher suite to use when transmitting messages back and forth. The following table shows the FIPS-compliant SSL cipher suites for each TLS version.

SQLNET.SSL_VERSION	Supported cipher suites
1.0	SSL_RSA_WITH_AES_256_CBC_SHA
1.2	SSL_RSA_WITH_AES_256_CBC_SHA SSL_RSA_WITH_AES_256_GCM_SHA384

For more information, see [Oracle database FIPS 140-2 settings](#) in the Oracle documentation.

## Adding the SSL option

To use SSL, your Amazon RDS for Oracle DB instance must be associated with an option group that includes the `SSL` option.

### Console

#### To add the SSL option to an option group

1. Create a new option group or identify an existing option group to which you can add the `SSL` option.

For information about creating an option group, see [Creating an option group \(p. 215\)](#).

2. Add the `SSL` option to the option group.

If you want to use only FIPS-verified cipher suites for SSL connections, set the option `FIPS.SSLFIPS_140` to `TRUE`. For information about the FIPS standard, see [FIPS support \(p. 1195\)](#).

For information about adding an option to an option group, see [Adding an option to an option group \(p. 217\)](#).

3. Create a new Oracle DB instance and associate the option group with it, or modify an Oracle DB instance to associate the option group with it.

For information about creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

### AWS CLI

#### To add the SSL option to an option group

1. Create a new option group or identify an existing option group to which you can add the `SSL` option.

For information about creating an option group, see [Creating an option group \(p. 215\)](#).

2. Add the `SSL` option to the option group.

Specify the following option settings:

- `Port` – The SSL port number
- `VpcSecurityGroupMemberships` – The VPC security group for which the option is enabled
- `SQLNET.SSL_VERSION` – The TLS version that client can use to connect to the DB instance

For example, the following AWS CLI command adds the `SSL` option to an option group named `ora-option-group`.

### Example

For Linux, macOS, or Unix:

```
aws rds add-option-to-option-group --option-group-name ora-option-group \
 --options
 'OptionName=SSL,Port=2484,VpcSecurityGroupMemberships="sg-68184619",OptionSettings=[{Name=SQLNET.SSL,Value=1}]]'
```

For Windows:

```
aws rds add-option-to-option-group --option-group-name ora-option-group ^
 --options
 'OptionName=SSL,Port=2484,VpcSecurityGroupMemberships="sg-68184619",OptionSettings=[{Name=SQLNET.SSL,Value=1}]]'
```

3. Create a new Oracle DB instance and associate the option group with it, or modify an Oracle DB instance to associate the option group with it.

For information about creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Configuring SQL\*Plus to use SSL with an Oracle DB instance

You must configure SQL\*Plus before connecting to an Oracle DB instance that uses the Oracle SSL option.

### Note

To allow access to the DB instance from the appropriate clients, ensure that your security groups are configured correctly. For more information, see [Controlling access with security groups \(p. 1737\)](#). Also, these instructions are for SQL\*Plus and other clients that directly use an Oracle home. For JDBC connections, see [Setting up an SSL connection over JDBC \(p. 1199\)](#).

### To configure SQL\*Plus to use SSL to connect to an Oracle DB instance

1. Set the `ORACLE_HOME` environment variable to the location of your Oracle home directory.

The path to your Oracle home directory depends on your installation. The following example sets the `ORACLE_HOME` environment variable.

```
prompt>export ORACLE_HOME=/home/user/app/user/product/12.1.0/dbhome_1
```

For information about setting Oracle environment variables, see [SQL\\*Plus environment variables](#) in the Oracle documentation, and also see the Oracle installation guide for your operating system.

2. Append `$ORACLE_HOME/lib` to the `LD_LIBRARY_PATH` environment variable.

The following is an example that sets the `LD_LIBRARY_PATH` environment variable.

```
prompt>export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:$ORACLE_HOME/lib
```

3. Create a directory for the Oracle wallet at `$ORACLE_HOME/ssl_wallet`.

The following is an example that creates the Oracle wallet directory.

```
prompt>mkdir $ORACLE_HOME/ssl_wallet
```

4. Download the root certificate that works for all AWS Regions and put the file in the ssl\_wallet directory.

For information about downloading the root certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

5. In the \$ORACLE\_HOME/network/admin directory, modify or create the tnsnames.ora file and include the following entry.

```
<net_service_name>= (DESCRIPTION = (ADDRESS_LIST = (ADDRESS = (PROTOCOL = TCPS)
(HOST = <endpoint>) (PORT = <ssl port number>)))(CONNECT_DATA = (SID = <database
name>))
(SECURITY = (SSL_SERVER_CERT_DN =
"C=US,ST=Washington,L=Seattle,O=Amazon.com,OU=RDS,CN=<endpoint>")))
```

6. In the same directory, modify or create the sqlnet.ora file and include the following parameters.

**Note**

To communicate with entities over a TLS secured connection, Oracle requires a wallet with the necessary certificates for authentication. You can use Oracle's ORAPKI utility to create and maintain Oracle wallets, as shown in step 7. For more information, see [Setting up Oracle wallet using ORAPKI](#) in the Oracle documentation.

```
WALLET_LOCATION = (SOURCE = (METHOD = FILE) (METHOD_DATA = (DIRECTORY = $ORACLE_HOME/
ssl_wallet)))
SSL_CLIENT_AUTHENTICATION = FALSE
SSL_VERSION = 1.0
SSL_CIPHER_SUITES = (SSL_RSA_WITH_AES_256_CBC_SHA)
SSL_SERVER_DN_MATCH = ON
```

**Note**

You can set SSL\_VERSION to a higher value if your DB instance supports it.

7. Run the following commands to create the Oracle wallet.

```
prompt>orapki wallet create -wallet $ORACLE_HOME/ssl_wallet -auto_login_only
prompt>orapki wallet add -wallet $ORACLE_HOME/ssl_wallet -trusted_cert -cert
$ORACLE_HOME/ssl_wallet/rds-ca-2019-root.pem -auto_login_only
```

Replace the file name with the one you downloaded.

## Connecting to an Oracle DB instance using SSL

After you configure SQL\*Plus to use SSL as described previously, you can connect to the Oracle DB instance with the SSL option. Optionally, you can first export the TNS\_ADMIN value that points to the directory that contains the tnsnames.ora and sqlnet.ora files. Doing so ensures that SQL\*Plus can find these files consistently. The following example exports the TNS\_ADMIN value.

```
export TNS_ADMIN = ${ORACLE_HOME}/network/admin
```

Connect to the DB instance. For example, you can connect using SQL\*Plus and a <net\_service\_name> in a tnsnames.ora file.

```
sqlplus <mydbuser>@<net_service_name>
```

You can also connect to the DB instance using SQL\*Plus without using a tnsnames.ora file by using the following command.

```
sqlplus '<mydbuser>@(DESCRIPTION = (ADDRESS = (PROTOCOL = TCPS)(HOST = <endpoint>) (PORT = <ssl port number>))(CONNECT_DATA = (SID = <database name>)))'
```

You can also connect to the Oracle DB instance without using SSL. For example, the following command connects to the DB instance through the clear text port without SSL encryption.

```
sqlplus '<mydbuser>@(DESCRIPTION = (ADDRESS = (PROTOCOL = TCP)(HOST = <endpoint>) (PORT = <port number>))(CONNECT_DATA = (SID = <database name>)))'
```

If you want to close Transmission Control Protocol (TCP) port access, create a security group with no IP address ingresses and add it to the instance. This addition closes connections over the TCP port, while still allowing connections over the SSL port that are specified from IP addresses within the range permitted by the SSL option security group.

## Setting up an SSL connection over JDBC

To use an SSL connection over JDBC, you must create a keystore, trust the Amazon RDS root CA certificate, and use the code snippet specified following.

To create the keystore in JKS format, use the following command. For more information about creating the keystore, see the [Oracle documentation](#).

```
keytool -keystore clientkeystore -genkey -alias client
```

Next, take the following steps to trust the Amazon RDS root CA certificate.

### To trust the Amazon RDS root CA certificate

1. Download the root certificate that works for all AWS Regions and put the file in the `ssl_wallet` directory.

For information about downloading the root certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

2. Convert the certificate to .der format using the following command.

```
openssl x509 -outform der -in rds-ca-2019-root.pem -out rds-ca-2019-root.der
```

Replace the file name with the one you downloaded.

3. Import the certificate into the keystore using the following command.

```
keytool -import -alias rds-root -keystore clientkeystore.jks -file rds-ca-2019-root.der
```

4. Confirm that the key store was created successfully.

```
keytool -list -v -keystore clientkeystore.jks
```

Enter the keystore password when you are prompted for it.

The following code example shows how to set up the SSL connection using JDBC.

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.util.Properties;

public class OracleSslConnectionTest {
 private static final String DB_SERVER_NAME = "<dns-name-provided-by-amazon-rds>";
 private static final Integer SSL_PORT = "<ssl-option-port-configured-in-option-group>";
 private static final String DB_SID = "<oracle-sid>";
 private static final String DB_USER = "<user name>";
 private static final String DB_PASSWORD = "<password>";
 // This key store has only the prod root ca.
 private static final String KEY_STORE_FILE_PATH = "<file-path-to-keystore>";
 private static final String KEY_STORE_PASS = "<keystore-password>";

 public static void main(String[] args) throws SQLException {
 final Properties properties = new Properties();
 final String connectionString = String.format(
 "jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCPS)(HOST=%s)(PORT=%d))(CONNECT_DATA=(SID=%s)))",
 DB_SERVER_NAME, SSL_PORT, DB_SID);
 properties.put("user", DB_USER);
 properties.put("password", DB_PASSWORD);
 properties.put("oracle.jdbc.J2EE13Compliant", "true");
 properties.put("javax.net.ssl.trustStore", KEY_STORE_FILE_PATH);
 properties.put("javax.net.ssl.trustStoreType", "JKS");
 properties.put("javax.net.ssl.trustStorePassword", KEY_STORE_PASS);
 final Connection connection = DriverManager.getConnection(connectionString,
 properties);
 // If no exception, that means handshake has passed, and an SSL connection can be
 opened
 }
}

```

## Enforcing a DN match with an SSL connection

You can use the Oracle parameter `SSL_SERVER_DN_MATCH` to enforce that the distinguished name (DN) for the database server matches its service name. If you enforce the match verifications, then SSL ensures that the certificate is from the server. If you don't enforce the match verification, then SSL performs the check but allows the connection, regardless if there is a match. If you do not enforce the match, you allow the server to potentially fake its identify.

To enforce DN matching, add the DN match property and use the connection string specified below.

Add the property to the client connection to enforce DN matching.

```
properties.put("oracle.net.ssl_server_dn_match", "TRUE");
```

Use the following connection string to enforce DN matching when using SSL.

```

final String connectionString = String.format(
 "jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCPS)(HOST=%s)(PORT=%d))" +
 "(CONNECT_DATA=(SID=%s))" +
 "(SECURITY = (SSL_SERVER_CERT_DN =
 \\"C=US,ST=Washington,L=Seattle,O=Amazon.com,OU=RDS,CN=%s\\")))",

```

```
DB_SERVER_NAME, SSL_PORT, DB_SID, DB_SERVER_NAME);
```

## Oracle Spatial

Amazon RDS supports Oracle Spatial through the use of the `SPATIAL` option. Oracle Spatial provides a SQL schema and functions that facilitate the storage, retrieval, update, and query of collections of spatial data in an Oracle database. For more information, see [Spatial Concepts](#) in the Oracle documentation.

### Important

If you use Oracle Spatial, Amazon RDS automatically updates your DB instance to the latest Oracle PSU when any of the following exist:

- Security vulnerabilities with a Common Vulnerability Scoring System (CVSS) score of 9+
- Other announced security vulnerabilities

Amazon RDS supports Oracle Spatial only in Oracle Enterprise Edition (EE) and Oracle Standard Edition 2 (SE2). The following table shows the versions of the DB engine that support EE and SE2.

Oracle DB Version	EE	SE2
19.0.0.0, all versions	Yes	Yes
18.0.0.0, all versions	Yes	Yes
12.2.0.1, all versions	Yes	Yes
12.1.0.2.v13 or later	Yes	No

## Prerequisites for Oracle Spatial

The following are prerequisites for using Oracle Spatial:

- Make sure that your DB instance is inside a virtual private cloud (VPC). For more information, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).
- Make sure that your DB instance is of a sufficient instance class. Oracle Spatial isn't supported for the db.t3.micro or db.t3.small DB instance classes. For more information, see [RDS for Oracle instance classes \(p. 1002\)](#).
- Make sure that your DB instance has **Auto Minor Version Upgrade** enabled. This option enables your DB instance to receive minor DB engine version upgrades automatically when they become available and is required for any options that install the Oracle Java Virtual Machine (JVM). Amazon RDS uses this option to update your DB instance to the latest Oracle Patch Set Update (PSU) or Release Update (RU). For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Best practices for Oracle Spatial

The following are best practices for using Oracle Spatial:

- For maximum security, use the `SPATIAL` option with Secure Sockets Layer (SSL). For more information, see [Oracle Secure Sockets Layer \(p. 1194\)](#).
- Configure your DB instance to restrict access to your DB instance. For more information, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#) and [Working with a DB instance in a VPC \(p. 1765\)](#).

## Adding the Oracle Spatial option

The following is the general process for adding the **SPATIAL** option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the **SPATIAL** option is added. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you add the option, you don't need to restart your DB instance. As soon as the option group is active, Oracle Spatial is available.

### Note

During this outage, password verification functions are disabled briefly. You can also expect to see events related to password verification functions during the outage. Password verification functions are enabled again before the Oracle DB instance is available.

### To add the **SPATIAL** option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose the Oracle edition for your DB instance.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).
2. Add the **SPATIAL** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Removing the Oracle Spatial option

After you drop all objects that use data types provided by the **SPATIAL** option, you can drop the option from a DB instance. If Oracle Java Virtual Machine (JVM) is *not* installed on the DB instance, there is a brief outage while the **SPATIAL** option is removed. There is no outage if Oracle Java Virtual Machine (JVM) is already installed on the DB instance. After you remove the **SPATIAL** option, you don't need to restart your DB instance.

### To drop the **SPATIAL** option

1. Back up your data.

### Warning

If the instance uses data types that were enabled as part of the option, and if you remove the **SPATIAL** option, you can lose data. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

2. Check whether any existing objects reference data types or features of the **SPATIAL** option.

If **SPATIAL** options exist, the instance can get stuck when applying the new option group that doesn't have the **SPATIAL** option. You can identify the objects by using the following queries:

```
SELECT OWNER, SEGMENT_NAME, TABLESPACE_NAME, BYTES/1024/1024 mbytes
FROM DBA_SEGMENTS
WHERE SEGMENT_TYPE LIKE '%TABLE%'
AND (OWNER, SEGMENT_NAME) IN
 (SELECT DISTINCT OWNER, TABLE_NAME
 FROM DBA_TAB_COLUMNS
 WHERE DATA_TYPE='SDO_Geometry'
 AND OWNER <> 'MDSYS')
ORDER BY 1,2,3,4;

SELECT OWNER, TABLE_NAME, COLUMN_NAME
FROM DBA_TAB_COLUMNS
WHERE DATA_TYPE = 'SDO_Geometry'
AND OWNER <> 'MDSYS'
ORDER BY 1,2,3;
```

3. Drop any objects that reference data types or features of the **SPATIAL** option.
4. Do one of the following:
  - Remove the **SPATIAL** option from the option group it belongs to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
  - Modify the DB instance and specify a different option group that doesn't include the **SPATIAL** option. This change affects a single DB instance. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle SQLT

Amazon RDS supports Oracle SQLTXPLAIN (SQLT) through the use of the SQLT option.

The Oracle `EXPLAIN PLAN` statement can determine the execution plan of a SQL statement. It can verify whether the Oracle optimizer chooses a certain execution plan, such as a nested loops join. It also helps you understand the optimizer's decisions, such as why it chose a nested loops join over a hash join. So `EXPLAIN PLAN` helps you understand the statement's performance.

SQLT is an Oracle utility that produces a report. The report includes object statistics, object metadata, optimizer-related initialization parameters, and other information that a database administrator can use to tune a SQL statement for optimal performance. SQLT produces an HTML report with hyperlinks to all of the sections in the report.

Unlike Automatic Workload Repository or Statspack reports, SQLT works on individual SQL statements. SQLT is a collection of SQL, PL/SQL, and SQL\*Plus files that collect, store, and display performance data.

Following are the supported Oracle versions for each SQLT version.

SQLT version	Oracle Database 19c	Oracle Database 18c	Oracle Database 12c Release 2 (12.2)	Oracle Database 12c Release 1 (12.1)
12.2.180725	Supported	Supported	Supported	Supported
12.2.180331	Not supported	Supported	Supported	Supported
12.1.160429	Not supported	Not supported	Supported	Supported

To download SQLT and access instructions for using it:

- Log in to your My Oracle Support account, and open the following documents:
  - To download SQLT: [Document 215187.1](#)
  - For SQLT usage instructions: [Document 1614107.1](#)
  - For frequently asked questions about SQLT: [Document 1454160.1](#)
  - For information about reading SQLT output: [Document 1456176.1](#)
  - For interpreting the Main report: [Document 1922234.1](#)

You can use SQLT with any edition of the following Oracle Database versions:

- Oracle Database 19c (19.0.0.0)
- Oracle Database 18c (18.0.0.0)
- Oracle Database 12c Release 2 (12.2.0.1)
- Oracle Database 12c Release 1 (12.1.0.2)

Amazon RDS does not support the following SQLT methods:

- `XPORE`
- `XHUME`

## Prerequisites for SQLT

The following are prerequisites for using SQLT:

- You must remove users and roles that are required by SQLT, if they exist.

The SQLT option creates the following users and roles on a DB instance:

- `SQLTXPLAIN` user
- `SQLTXADMIN` user
- `SQLT_USER_ROLE` role

If your DB instance has any of these users or roles, log in to the DB instance using a SQL client, and drop them using the following statements:

```
DROP USER SQLTXPLAIN CASCADE;
DROP USER SQLTXADMIN CASCADE;
DROP ROLE SQLT_USER_ROLE CASCADE;
```

- You must remove tablespaces that are required by SQLT, if they exist.

The SQLT option creates the following tablespaces on a DB instance:

- `RDS_SQLT_TS`
- `RDS_TEMP_SQLT_TS`

If your DB instance has these tablespaces, log in to the DB instance using a SQL client, and drop them.

## SQLT option settings

SQLT can work with licensed features that are provided by the Oracle Tuning Pack and the Oracle Diagnostics Pack. The Oracle Tuning Pack includes the SQL Tuning Advisor, and the Oracle Diagnostics Pack includes the Automatic Workload Repository. The SQLT settings enable or disable access to these features from SQLT.

Amazon RDS supports the following settings for the SQLT option.

Option setting	Valid values	Default value	Description
<code>LICENSE_PACK</code>	T, D, N	N	<p>The Oracle Management Packs that you want to access with SQLT. Enter one of the following values:</p> <ul style="list-style-type: none"> <li>• T indicates that you have a license for the Oracle Tuning Pack and the Oracle Diagnostics Pack, and you want to access the SQL Tuning Advisor and Automatic Workload Repository from SQLT.</li> <li>• D indicates that you have a license for the Oracle Diagnostics Pack, and you want to access the Automatic Workload Repository from SQLT.</li> <li>• N indicates that you don't have a license for the Oracle Tuning Pack and the Oracle Diagnostics Pack, or that you have a license for one or both of them, but you don't want SQLT to access them.</li> </ul> <p><b>Note</b> Amazon RDS does not provide licenses for these Oracle Management Packs. If you indicate that</p>

Option setting	Valid values	Default value	Description
			you want to use a pack that is not included in your DB instance, you can use SQLT with the DB instance. However, SQLT can't access the pack, and the SQLT report doesn't include the data for the pack. For example, if you specify <code>T</code> , but the DB instance doesn't include the Oracle Tuning Pack, SQLT works on the DB instance, but the report it generates doesn't contain data related to the Oracle Tuning Pack.
VERSION	2016-04-29, 2018-03-31, 2018-07-25	v1, v1	<p>The version of SQLT that you want to install.</p> <p><b>Note</b> For Oracle Database 19c (19.0.0.0), the only supported version is 2018-07-25 .v1. This version is also the default for Oracle Database 19c.</p>

## Adding the SQLT option

The following is the general process for adding the SQLT option to a DB instance:

1. Create a new option group, or copy or modify an existing option group.
2. Add the SQLT option to the option group.
3. Associate the option group with the DB instance.

After you add the SQLT option, as soon as the option group is active, SQLT is active.

### To add the SQLT option to a DB instance

1. Determine the option group that you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose the Oracle edition that you want to use. The SQLT option is supported on all editions.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **SQLT** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
4. (Optional) Verify the SQLT installation on each DB instance with the SQLT option.
  - a. Use a SQL client to connect to the DB instance as the master user.

For information about connecting to an Oracle DB instance using a SQL client, see [Connecting to your Oracle DB instance \(p. 1013\)](#).

- b. Run the following query:

```
SELECT sqlxplain.sqlt$a.get_param('tool_version') sqlt_version FROM DUAL;
```

The query returns the current version of the SQLT option on Amazon RDS. 12.1.160429 is an example of a version of SQLT that is available on Amazon RDS.

5. Change the passwords of the users that are created by the SQLT option.

- a. Use a SQL client to connect to the DB instance as the master user.
- b. Run the following SQL statement to change the password for the SQLTXADMIN user:

```
ALTER USER SQLTXADMIN IDENTIFIED BY new_password ACCOUNT UNLOCK;
```

- c. Run the following SQL statement to change the password for the SQLTXPLAIN user:

```
ALTER USER SQLTXPLAIN IDENTIFIED BY new_password ACCOUNT UNLOCK;
```

#### Note

Upgrading SQLT requires uninstalling an older version of SQLT and then installing the new version. So, all SQLT metadata can be lost when you upgrade SQLT. A major version upgrade of a database also uninstalls and re-installs SQLT. An example of a major version upgrade is an upgrade from Oracle Database 18c to Oracle Database 19c.

## Using SQLT

SQLT works with the Oracle SQL\*Plus utility.

### To use SQLT

1. Download the SQLT .zip file from [Document 215187.1](#) on the My Oracle Support site.

#### Note

You can't download SQLT 12.1.160429 from the My Oracle Support site. Oracle has deprecated this older version.

2. Unzip the SQLT .zip file.
  3. From a command prompt, change to the `sqlt/run` directory on your file system.
  4. From the command prompt, open SQL\*Plus, and connect to the DB instance as the master user.
- For information about connecting to a DB instance using SQL\*Plus, see [Connecting to your Oracle DB instance \(p. 1013\)](#).
5. Get the SQL ID of a SQL statement:

```
SELECT SQL_ID FROM V$SQL WHERE SQL_TEXT='sql_statement';
```

Your output is similar to the following:

```
SQL_ID

chvsmttqjzjkn
```

6. Analyze a SQL statement with SQLT:

```
START sqltxtract.sql sql_id sqltxplain_user_password
```

For example, for the SQL ID *chvsmttqjzjkn*, enter the following:

```
START sqltxtract.sql chvsmttqjzjkn sqltxplain_user_password
```

SQLT generates the HTML report and related resources as a .zip file in the directory from which the SQLT command was run.

7. (Optional) To enable application users to diagnose SQL statements with SQLT, grant *SQLT\_USER\_ROLE* to each application user with the following statement:

```
GRANT SQLT_USER_ROLE TO application_user_name;
```

**Note**

Oracle does not recommend running SQLT with the *SYS* user or with users that have the *DBA* role. It is a best practice to run SQLT diagnostics using the application user's account, by granting *SQLT\_USER\_ROLE* to the application user.

## Upgrading the SQLT option

With Amazon RDS for Oracle, you can upgrade the SQLT option from your existing version to a higher version. To upgrade the SQLT option, complete steps 1–3 in [Using SQLT \(p. 1208\)](#) for the new version of SQLT. Also, if you granted privileges for the previous version of SQLT in step 7 of that section, grant the privileges again for the new SQLT version.

Upgrading the SQLT option results in the loss of the older SQLT version's metadata. The older SQLT version's schema and related objects are dropped, and the newer version of SQLT is installed. For more information about the changes in the latest SQLT version, see [Document 1614201.1](#) on the My Oracle Support site.

**Note**

Version downgrades are not supported.

## Modifying SQLT settings

After you enable SQLT, you can modify the *LICENSE\_PACK* and *VERSION* settings for the option.

For more information about how to modify option settings, see [Modifying an option setting \(p. 222\)](#). For more information about each setting, see [SQL option settings \(p. 1206\)](#).

## Removing the SQL option

You can remove SQL from a DB instance.

To remove SQL from a DB instance, do one of the following:

- To remove SQL from multiple DB instances, remove the SQL option from the option group to which the DB instances belong. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- To remove SQL from a single DB instance, modify the DB instance and specify a different option group that doesn't include the SQL option. You can specify the default (empty) option group or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Oracle Statspack

The Oracle Statspack option installs and enables the Oracle Statspack performance statistics feature. Oracle Statspack is a collection of SQL, PL/SQL, and SQL\*Plus scripts that collect, store, and display performance data. For information about using Oracle Statspack, see [Oracle Statspack](#) in the Oracle documentation.

### Note

Oracle Statspack is no longer supported by Oracle and has been replaced by the more advanced Automatic Workload Repository (AWR). AWR is available only for Oracle Enterprise Edition customers who have purchased the Diagnostics Pack. You can use Oracle Statspack with any Oracle DB engine on Amazon RDS. You can't run Oracle Statspack on Amazon RDS read replicas.

## Setting up Oracle Statspack

To run Statspack scripts, you must add the Statspack option.

### To set up Oracle Statspack

1. In a SQL client, log in to the Oracle DB with an administrative account.
2. Do either of the following actions, depending on whether Statspack is installed:
  - If Statspack is installed, and the `PERFSTAT` account is associated with Statspack, skip to Step 4.
  - If Statspack is not installed, and the `PERFSTAT` account exists, drop the account as follows:

```
DROP USER PERFSTAT CASCADE;
```

Otherwise, attempting to add the Statspack option generates an error and `RDS-Event-0058`.

3. Add the Statspack option to an option group. See [Adding an option to an option group \(p. 217\)](#).  
Amazon RDS automatically installs the Statspack scripts on the DB instance and then sets up the `PERFSTAT` account.
4. Reset the password using the following SQL statement, replacing `pwd` with your new password:

```
ALTER USER PERFSTAT IDENTIFIED BY pwd ACCOUNT UNLOCK;
```

You can log in using the `PERFSTAT` user account and run the Statspack scripts.

5. Do either of the following actions, depending on your DB engine version:
  - If you are using Oracle Database 18c or lower, skip this step.
  - If you are using Oracle Database 19c or higher, grant the `CREATE JOB` privilege to the `PERFSTAT` account using the following statement:

```
GRANT CREATE JOB TO PERFSTAT;
```

6. Ensure that idle wait events in the `PERFSTAT.STATS$IDLE_EVENT` table are populated.

Because of Oracle Bug 28523746, the idle wait events in `PERFSTAT.STATS$IDLE_EVENT` may not be populated. To ensure all idle events are available, run the following statement:

```
INSERT INTO PERFSTAT.STATS$IDLE_EVENT (EVENT)
SELECT NAME FROM V$EVENT_NAME WHERE WAIT_CLASS='Idle'
MINUS
SELECT EVENT FROM PERFSTAT.STATS$IDLE_EVENT;
COMMIT;
```

## Generating Statspack reports

A Statspack report compares two snapshots.

### To generate Statspack reports

1. In a SQL client, log in to the Oracle DB with the `PERFSTAT` account.
2. Create a snapshot using either of the following techniques:
  - Create a Statspack snapshot manually.
  - Create a job that takes a Statspack snapshot after a given time interval. For example, the following job creates a Statspack snapshot every hour:

```
VARIABLE jn NUMBER;
exec dbms_job.submit(:jn, 'statspack.snap;', SYSDATE, 'TRUNC(SYSDATE+1/24, ''HH24'')");
COMMIT;
```

3. View the snapshots using the following query:

```
SELECT SNAP_ID, SNAP_TIME FROM STATS$SNAPSHOT ORDER BY 1;
```

4. Run the Amazon RDS procedure `rdsadmin.rds_run_spreport`, replacing `begin_snap` and `end_snap` with the snapshot IDs:

```
exec rdsadmin.rds_run_spreport(begin_snap,end_snap);
```

For example, the following command creates a report based on the interval between Statspack snapshots 1 and 2:

```
exec rdsadmin.rds_run_spreport(1,2);
```

The file name of the Statspack report includes the number of the two snapshots. For example, a report file created using Statspack snapshots 1 and 2 would be named `ORCL_spreport_1_2.lst`.

5. Monitor the output for errors.

Oracle Statspack performs checks before running the report. Therefore, you could also see error messages in the command output. For example, you might try to generate a report based on an invalid range, where the beginning Statspack snapshot value is larger than the ending value. In this case, the output shows the error message, but the DB engine does not generate an error file.

```
exec rdsadmin.rds_run_spreport(2,1);
*
ERROR at line 1:
ORA-20000: Invalid snapshot IDs. Find valid ones in perfstat.stats$snapshot.
```

If you use an invalid number a Statspack snapshot, the output shows an error. For example, if you try to generate a report for snapshots 1 and 50, but snapshot 50 doesn't exist, the output shows an error.

```
exec rdsadmin.rds_run_spreport(1,50);
*
ERROR at line 1:
ORA-20000: Could not find both snapshot IDs
```

6. (Optional)

To retrieve the report, call the trace file procedures, as explained in [Working with Oracle trace files \(p. 550\)](#).

Alternatively, download the Statspack report from the RDS console. Go to the **Log** section of the DB instance details and choose **Download**:

Logs (342)		
Name	Last written	Size
trace/ORCL_mmon_11800.trc	Thu Jan 18 09:39:14 GMT-800 2018	68.2 kB
trace/ORCL_mmon_11800.trm	Thu Jan 18 09:39:14 GMT-800 2018	6.7 kB
trace/ORCL_spreport_1_2.trc	Thu Jan 18 09:38:03 GMT-800 2018	107.5 kB
trace/alert_ORCL.log	Thu Jan 18 09:37:39 GMT-800 2018	60.5 kB
audit/ORCL_ora_26710_2018011817315766624143795.aud	Thu Jan 18 09:31:57 GMT-800 2018	5.5 kB

If an error occurs while generating a report, the DB engine uses the same naming conventions as for a report but with an extension of .err. For example, if an error occurred while creating a report using Statspack snapshots 1 and 7, the report file would be named ORCL\_spreport\_1\_7.err. You can download the error report using the same techniques as for a standard Snapshot report.

## Removing Statspack files

To remove Oracle Statspack files, use the following command:

```
exec statspack.purge(begin snap, end snap);
```

## Oracle time zone

You can use the time zone option to change the system time zone used by your Oracle DB instance. For example, you might change the time zone of a DB instance to be compatible with an on-premises environment, or a legacy application. The time zone option changes the time zone at the host level. Changing the time zone impacts all date columns and values, including `SYSDATE` and `SYSTIMESTAMP`.

The time zone option differs from the `rdsadmin_util.alter_db_time_zone` command. The `alter_db_time_zone` command changes the time zone only for certain data types. The time zone option changes the time zone for all date columns and values. For more information about `alter_db_time_zone`, see [Setting the database time zone \(p. 1064\)](#). For more information about upgrade considerations, see [Time zone considerations \(p. 1225\)](#).

## Considerations for setting the time zone

The time zone option is a permanent and persistent option. Therefore, you can't do the following:

- Remove the option from an option group after you add the option.
- Remove the option group from a DB instance after you add the group.
- Modify the time zone setting of the option to a different time zone.

If you accidentally set the time zone incorrectly, you need to recover the DB instance to its previous time zone setting. We strongly urge you to use one of the following strategies, depending on your situation:

- Your DB instance currently uses the default option group.

Take a snapshot of your DB instance, and then add the time zone option to your DB instance. For more information, see [Creating a DB snapshot \(p. 349\)](#).

- Your DB instance currently uses a nondefault option group.

Take a snapshot of your DB instance, create a new option group with the time zone option, and then add the option group to your instance.

We strongly urge you to test the time zone option on a test DB instance before you add it to a production DB instance. Adding the time zone option can cause problems with tables that use system date to add dates or times. We recommend that you analyze your data and applications to determine the impact of changing the time zone.

## Time zone option settings

Amazon RDS supports the following settings for the time zone option.

Option setting	Valid values	Description
<code>TIME_ZONE</code>	One of the available time zones. For the full list, see <a href="#">Available time zones (p. 1215)</a> .	The new time zone for your DB instance.

## Adding the time zone option

The general process for adding the time zone option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.

2. Add the option to the option group.
3. Associate the option group with the DB instance.

When you add the time zone option, a brief outage occurs while your DB instance is automatically restarted.

## Console

### To add the time zone option to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine** choose the oracle edition for your DB instance.
  - b. For **Major engine version** choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **Timezone** option to the option group, and configure the option settings.

#### Important

If you add the time zone option to an existing option group that is already attached to one or more DB instances, a brief outage occurs while all the DB instances are automatically restarted.

For more information about adding options, see [Adding an option to an option group \(p. 217\)](#). For more information about each setting, see [Time zone option settings \(p. 1213\)](#).

3. Apply the option group to a new or existing DB instance:

- For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. When you add the time zone option to an existing DB instance, a brief outage occurs while your DB instance is automatically restarted. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## AWS CLI

The following example uses the AWS CLI [add-option-to-option-group](#) command to add the **Timezone** option and the **TIME\_ZONE** option setting to an option group called **myoptiongroup**. The time zone is set to **Africa/Cairo**.

For Linux, macOS, or Unix:

```
aws rds add-option-to-option-group \
--option-group-name "myoptiongroup" \
--options "OptionName=Timezone,OptionSettings=[{Name=TIME_ZONE,Value=Africa/Cairo}]" \
--apply-immediately
```

For Windows:

```
aws rds add-option-to-option-group ^
--option-group-name "myoptiongroup" ^
--options "OptionName=Timezone,OptionSettings=[{Name=TIME_ZONE,Value=Africa/Cairo}]" ^
--apply-immediately
```

## Modifying time zone settings

The time zone option is a permanent and persistent option. You can't remove the option from an option group after you add it. You can't remove the option group from a DB instance after you add it. You can't modify the time zone setting of the option to a different time zone. If you set the time zone incorrectly, restore a snapshot of your DB instance from before you added the time zone option.

## Removing the time zone option

The time zone option is a permanent and persistent option. You can't remove the option from an option group after you add it. You can't remove the option group from a DB instance after you add it. To remove the time zone option, restore a snapshot of your DB instance from before you added the time zone option.

## Available time zones

The following values can be used for the time zone option.

Zone	Time zone
Africa	Africa/Cairo, Africa/Casablanca, Africa/Harare, Africa/Lagos, Africa/Luanda, Africa/Monrovia, Africa/Nairobi, Africa/Tripoli, Africa/Windhoek
America	America/Araguaina, America/Argentina/Buenos_Aires, America/Asuncion, America/Bogota, America/Caracas, America/Chicago, America/Chihuahua, America/Cuiaba, America/Denver, America/Detroit, America/Fortaleza, America/Godthab, America/Guatemala, America/Halifax, America/Lima, America/Los_Angeles, America/Manaus, America/Matamoros, America/Mexico_City, America/Monterrey, America/Montevideo, America/New_York, America/Phoenix, America/Santiago, America/Sao_Paulo, America/Tijuana, America/Toronto
Asia	Asia/Amman, Asia/Ashgabat, Asia/Baghdad, Asia/Baku, Asia/Bangkok, Asia/Beirut, Asia/Calcutta, Asia/Damascus, Asia/Dhaka, Asia/Hong_Kong, Asia/Irkutsk, Asia/Jakarta, Asia/Jerusalem, Asia/Kabul, Asia/Karachi, Asia/Kathmandu, Asia/Kolkata, Asia/Krasnoyarsk, Asia/Magadan, Asia/Manila, Asia/Muscat, Asia/Novosibirsk, Asia/Rangoon, Asia/Riyadh, Asia/Seoul, Asia/Shanghai, Asia/Singapore, Asia/Taipei, Asia/Tehran, Asia/Tokyo, Asia/Ulaanbaatar, Asia/Vladivostok, Asia/Yakutsk, Asia/Yerevan
Atlantic	Atlantic/Azores, Atlantic/Cape_Verde
Australia	Australia/Adelaide, Australia/Brisbane, Australia/Darwin, Australia/Eucla, Australia/Hobart, Australia/Lord_Howe, Australia/Perth, Australia/Sydney
Brazil	Brazil/DeNoronha, Brazil/East
Canada	Canada/Newfoundland, Canada/Saskatchewan
Etc	Etc/GMT-3
Europe	Europe/Amsterdam, Europe/Athens, Europe/Berlin, Europe/Dublin, Europe/Helsinki, Europe/Kaliningrad, Europe/London, Europe/Madrid, Europe/Moscow, Europe/Paris, Europe/Prague, Europe/Rome, Europe/Sarajevo
Pacific	Pacific/Apia, Pacific/Auckland, Pacific/Chatham, Pacific/Fiji, Pacific/Guam, Pacific/Honolulu, Pacific/Kiritimati, Pacific/Marquesas, Pacific/Samoa, Pacific/Tongatapu, Pacific/Wake

Zone	Time zone
US	US/Alaska, US/Central, US/East-Indiana, US/Eastern, US/Pacific
UTC	UTC

## Oracle Transparent Data Encryption

Amazon RDS supports Oracle Transparent Data Encryption (TDE), a feature of the Oracle Advanced Security option available in Oracle Enterprise Edition. This feature automatically encrypts data before it is written to storage and automatically decrypts data when the data is read from storage.

Oracle Transparent Data Encryption is used in scenarios where you need to encrypt sensitive data in case data files and backups are obtained by a third party or when you need to address security-related regulatory compliance issues.

The TDE option is a permanent option that can't be removed from an option group. You can't disable TDE from a DB instance once that instance is associated with an option group with the Oracle TDE option. You can change the option group of a DB instance that is using the TDE option, but the option group associated with the DB instance must include the TDE option. You can also modify an option group that includes the TDE option by adding or removing other options.

A detailed explanation about Oracle Transparent Data Encryption is beyond the scope of this guide. For information about using Oracle Transparent Data Encryption, see [Securing stored data using Transparent Data Encryption](#). For more information about Oracle Advanced Security, see [Oracle advanced security](#) in the Oracle documentation. For more information on AWS security, see the [AWS security center](#).

**Note**

You can't share a DB snapshot that uses this option. For more information about sharing DB snapshots, see [Sharing a DB snapshot \(p. 368\)](#).

## TDE encryption modes

Oracle Transparent Data Encryption supports two encryption modes: TDE tablespace encryption and TDE column encryption. TDE tablespace encryption is used to encrypt entire application tables. TDE column encryption is used to encrypt individual data elements that contain sensitive data. You can also apply a hybrid encryption solution that uses both TDE tablespace and column encryption.

**Note**

Amazon RDS manages the Oracle Wallet and TDE master key for the DB instance. You do not need to set the encryption key using the command `ALTER SYSTEM set encryption key`.

For information about TDE best practices, see [Oracle advanced security Transparent Data Encryption best practices](#).

Once the option is enabled, you can check the status of the Oracle Wallet by using the following command:

```
SELECT * FROM v$encryption_wallet;
```

To create an encrypted tablespace, use the following command:

```
CREATE TABLESPACE encrypt_ts ENCRYPTION DEFAULT STORAGE (ENCRYPT);
```

To specify the encryption algorithm, use the following command:

```
CREATE TABLESPACE encrypt_ts ENCRYPTION USING 'AES256' DEFAULT STORAGE (ENCRYPT);
```

Note that the previous commands for encrypting a tablespace are the same as the commands you would use with an Oracle installation not on Amazon RDS, and the `ALTER TABLE` syntax to encrypt a column is also the same as the commands you would use for an Oracle installation not on Amazon RDS.

You should determine if your DB instance is associated with an option group that has the **TDE** option. To view the option group that a DB instance is associated with, you can use the RDS console, the `describe-db-instance` AWS CLI command, or the API operation [DescribeDBInstances](#).

To comply with several security standards, Amazon RDS is working to implement automatic periodic master key rotation.

## Adding the TDE option

The process for using Oracle Transparent Data Encryption (TDE) with Amazon RDS is as follows:

1. If the DB instance is not associated with an option group that has the **TDE** option enabled, you must either create an option group and add the **TDE** option or modify the associated option group to add the **TDE** option. For information about creating or modifying an option group, see [Working with option groups \(p. 213\)](#). For information about adding an option to an option group, see [Adding an option to an option group \(p. 217\)](#).
2. Associate the DB instance with the option group with the **TDE** option. For information about associating a DB instance with an option group, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Removing the TDE option

If you no longer want to use the TDE option with a DB instance, you must decrypt all your data on the DB instance, copy the data to a new DB instance that is not associated with an option group with TDE enabled, and then delete the original instance. You can rename the new instance to be the same name as the previous DB instance if you prefer.

## Using TDE with Oracle Data Pump

You can use Oracle Data Pump to import or export encrypted dump files. Amazon RDS supports the password encryption mode (`ENCRYPTION_MODE=PASSWORD`) for Oracle Data Pump. Amazon RDS does not support transparent encryption mode (`ENCRYPTION_MODE=TRANSPARENT`) for Oracle Data Pump. For more information about using Oracle Data Pump with Amazon RDS, see [Importing using Oracle Data Pump \(p. 1118\)](#).

## Oracle UTL\_MAIL

Amazon RDS supports Oracle UTL\_MAIL through the use of the UTL\_MAIL option and SMTP servers. You can send email directly from your database by using the UTL\_MAIL package. Amazon RDS supports UTL\_MAIL for the following versions of Oracle:

- Oracle Database 19c (19.0.0.0), all versions
- Oracle Database 18c (18.0.0.0), all versions
- Oracle Database 12c Release 2 (12.2), all versions
- Oracle Database 12c Release 1 (12.1), version 12.1.0.2.v5 and later

The following are some limitations to using UTL\_MAIL:

- UTL\_MAIL does not support Transport Layer Security (TLS) and therefore emails are not encrypted.

To connect securely to remote SSL/TLS resources by creating and uploading custom Oracle wallets, follow the instructions in [Configuring outbound network access on your Oracle DB instance \(p. 1037\)](#).

The specific certificates that are required for your wallet vary by service. For AWS services, these can typically be found in the [Amazon trust services repository](#).

- UTL\_MAIL does not support authentication with SMTP servers.
- You can only send a single attachment in an email.
- You can't send attachments larger than 32 K.
- You can only use ASCII and Extended Binary Coded Decimal Interchange Code (EBCDIC) character encodings.
- SMTP port (25) is throttled based on the elastic network interface owner's policies.

When you enable UTL\_MAIL, only the master user for your DB instance is granted the execute privilege. If necessary, the master user can grant the execute privilege to other users so that they can use UTL\_MAIL.

**Important**

We recommend that you enable Oracle's built-in auditing feature to track the use of UTL\_MAIL procedures.

## Prerequisites for Oracle UTL\_MAIL

The following are prerequisites for using Oracle UTL\_MAIL:

- One or more SMTP servers, and the corresponding IP addresses or public or private Domain Name Server (DNS) names. For more information about private DNS names resolved through a custom DNS server, see [Setting up a custom DNS server \(p. 1057\)](#).
- For Oracle versions prior to 12c, your DB instance must also use the XML DB option. For more information, see [Oracle XML DB \(p. 1220\)](#).

## Adding the Oracle UTL\_MAIL option

The general process for adding the Oracle UTL\_MAIL option to a DB instance is the following:

1. Create a new option group, or copy or modify an existing option group.
2. Add the option to the option group.
3. Associate the option group with the DB instance.

After you add the UTL\_MAIL option, as soon as the option group is active, UTL\_MAIL is active.

### To add the UTL\_MAIL option to a DB instance

1. Determine the option group you want to use. You can create a new option group or use an existing option group. If you want to use an existing option group, skip to the next step. Otherwise, create a custom DB option group with the following settings:
  - a. For **Engine**, choose the edition of Oracle you want to use.
  - b. For **Major engine version**, choose the version of your DB instance.

For more information, see [Creating an option group \(p. 215\)](#).

2. Add the **UTL\_MAIL** option to the option group. For more information about adding options, see [Adding an option to an option group \(p. 217\)](#).
3. Apply the option group to a new or existing DB instance:
  - For a new DB instance, you apply the option group when you launch the instance. For more information, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
  - For an existing DB instance, you apply the option group by modifying the instance and attaching the new option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Using Oracle UTL\_MAIL

After you enable the UTL\_MAIL option, you must configure the SMTP server before you can begin using it.

You configure the SMTP server by setting the **SMTP\_OUT\_SERVER** parameter to a valid IP address or public DNS name. For the **SMTP\_OUT\_SERVER** parameter, you can specify a comma-separated list of the addresses of multiple servers. If the first server is unavailable, UTL\_MAIL tries the next server, and so on.

You can set the default **SMTP\_OUT\_SERVER** for a DB instance by using a [DB parameter group](#). You can set the **SMTP\_OUT\_SERVER** parameter for a session by running the following code on your database on your DB instance.

```
ALTER SESSION SET smtp_out_server = mailserver.domain.com:25;
```

After the UTL\_MAIL option is enabled, and your **SMTP\_OUT\_SERVER** is configured, you can send mail by using the **SEND** procedure. For more information, see [UTL\\_MAIL](#) in the Oracle documentation.

## Removing the Oracle UTL\_MAIL option

You can remove Oracle UTL\_MAIL from a DB instance.

To remove UTL\_MAIL from a DB instance, do one of the following:

- To remove UTL\_MAIL from multiple DB instances, remove the UTL\_MAIL option from the option group they belong to. This change affects all DB instances that use the option group. For more information, see [Removing an option from an option group \(p. 225\)](#).
- To remove UTL\_MAIL from a single DB instance, modify the DB instance and specify a different option group that doesn't include the UTL\_MAIL option. You can specify the default (empty) option group, or a different custom option group. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Troubleshooting

The following are issues you might encounter when you use UTL\_MAIL with Amazon RDS.

- **Throttling.** SMTP port (25) is throttled based on the elastic network interface owner's policies. If you can successfully send email by using UTL\_MAIL, and you see the error ORA-29278: `SMTP transient error: 421 Service not available`, you are possibly being throttled. If you experience throttling with email delivery, we recommend that you implement a backoff algorithm. For more information about backoff algorithms, see [Error retries and exponential backoff in AWS](#) and [How to handle a "throttling – Maximum sending rate exceeded" error](#).

You can request that this throttle be removed. For more information, see [How do I remove the throttle on port 25 from my EC2 instance?](#).

## Oracle XML DB

Oracle XML DB adds native XML support to your DB instance. With XML DB, you can store and retrieve structured or unstructured XML, in addition to relational data. XML DB is preinstalled on Oracle version 12c and later.

# Upgrading the Oracle DB engine

When Amazon RDS supports a new version of Oracle, you can upgrade your DB instances to the new version. For information about which Oracle versions are available on Amazon RDS, see [Oracle database engine release notes \(p. 1257\)](#).

## Important

RDS for Oracle Database 11g is deprecated. If you maintain Oracle Database 11g snapshots, you can upgrade them to a later release. For more information, see [Upgrading an Oracle DB snapshot \(p. 1229\)](#).

## Topics

- [Overview of Oracle DB engine upgrades \(p. 1221\)](#)
- [Major version upgrades \(p. 1223\)](#)
- [Oracle minor version upgrades \(p. 1224\)](#)
- [Oracle SE2 upgrade paths \(p. 1224\)](#)
- [Considerations for Oracle DB upgrades \(p. 1225\)](#)
- [Preparing for the automatic upgrade of Oracle Database 18c \(p. 1226\)](#)
- [Testing an Oracle DB upgrade \(p. 1227\)](#)
- [Upgrading an Oracle DB instance \(p. 1228\)](#)

## Overview of Oracle DB engine upgrades

Before upgrading your Oracle DB instance, familiarize yourself with the following concepts.

## Topics

- [Major and minor version upgrades \(p. 1221\)](#)
- [Oracle engine version management \(p. 1222\)](#)
- [Automatic snapshots during engine upgrades \(p. 1222\)](#)
- [Oracle upgrades in a Multi-AZ deployment \(p. 1222\)](#)
- [Oracle upgrades of read replicas \(p. 1222\)](#)
- [Oracle upgrades of micro DB instances \(p. 1223\)](#)

## Major and minor version upgrades

Amazon RDS supports the following upgrades to an Oracle DB instance:

- Major version upgrades

In general, a *major version upgrade* for a database engine can introduce changes that aren't compatible with existing applications. To upgrade your DB instance to a major version, you must perform the action manually.

- Minor version upgrades

A *minor version upgrade* includes only changes that are backward-compatible with existing applications. If you enable auto minor version upgrades on your DB instance, minor version upgrades occur automatically. In all other cases, you upgrade the DB instance manually.

When you upgrade the DB engine, an outage occurs. The duration of the outage depends on your engine version and instance size.

## Oracle engine version management

With DB engine version management, you control when and how the database engine is patched and upgraded. You get the flexibility to maintain compatibility with database engine patch versions. You can also test new patch versions to ensure they work with your application before deploying them in production. In addition, you upgrade the versions on your own terms and timelines.

**Note**

Amazon RDS periodically aggregates official Oracle database patches using an Amazon RDS-specific DB engine version. To see a list of which Oracle patches are contained in an Amazon RDS Oracle-specific engine version, go to [Oracle database engine release notes \(p. 1257\)](#).

## Automatic snapshots during engine upgrades

During upgrades of an Oracle DB instance, snapshots offer protection against upgrade issues. If the backup retention period for your DB instance is greater than 0, Amazon RDS takes the following DB snapshots during the upgrade:

1. A snapshot of the DB instance before any upgrade changes have been made. If the upgrade fails, you can restore this snapshot to create a DB instance running the old version.
2. A snapshot of the DB instance after the upgrade completes.

**Note**

To change your backup retention period, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

After an upgrade, you can't revert to the previous engine version. However, you can create a new Oracle DB instance by restoring the pre-upgrade snapshot.

## Oracle upgrades in a Multi-AZ deployment

If your DB instance is in a Multi-AZ deployment, Amazon RDS upgrades both the primary and standby replicas. If no operating system updates are required, the primary and standby upgrades occur simultaneously. The instances are not available until the upgrade completes.

If operating system updates are required in a Multi-AZ deployment, Amazon RDS applies the updates when you request the DB upgrade. Amazon RDS performs the following steps:

1. Updates the operating system on the standby DB instance.
2. Upgrades the standby DB instance.
3. Fails over the primary instance to the standby DB instance.
4. Upgrades the operating system on the new standby DB instance, which was formerly the primary instance.
5. Upgrades the new standby DB instance.

## Oracle upgrades of read replicas

The Oracle DB engine version of the source DB instance and all of its read replicas must be the same. Amazon RDS performs the upgrade in the following stages:

1. Upgrades the source DB instance. The read replicas are available during this stage.
2. Upgrades the read replicas in parallel, regardless of the replica maintenance windows. The source DB is available during this stage.

For major version upgrades of cross-Region read replicas, Amazon RDS performs additional actions:

- Generates an option group for the target version automatically
- Copies all options and option settings from the original option group to the new option group
- Associates the upgraded cross-Region read replica with the new option group

## Oracle upgrades of micro DB instances

We don't recommend upgrading databases running on micro DB instances. Because these instances have limited CPU, the upgrade can take hours to complete.

You can upgrade micro DB instances with small amounts of storage (10–20 GiB) by copying your data using Data Pump. Before you migrate your production DB instances, we recommend that you test by copying data using Data Pump.

## Major version upgrades

Amazon RDS supports the following major version upgrades.

To perform a major version upgrade, modify the DB instance manually. Major version upgrades don't occur automatically.

## Supported versions for major upgrades

Amazon RDS supports the following major version upgrades.

Current version	Upgrade supported
18.0.0.0	19.0.0.0
12.2.0.1	19.0.0.0
	18.0.0.0
12.1.0.2	19.0.0.0
	18.0.0.0
	12.2.0.1

A major version upgrade of Oracle Database must upgrade to a Release Update (RU) that was released in the same month or later. Major version downgrades aren't supported for any Oracle versions.

## Supported instance classes for major upgrades

Your current Oracle DB instance might run on a DB instance class that isn't supported for the version to which you are upgrading. In this case, before you upgrade, migrate the DB instance to a supported DB instance class. For more information about the supported DB instance classes for each version and edition of Amazon RDS for Oracle, see [DB instance classes \(p. 7\)](#).

## Gathering statistics before major upgrades

Before you perform a major version upgrade, Oracle recommends that you gather optimizer statistics on the DB instance that you are upgrading. This action can reduce DB instance downtime during the upgrade.

To gather optimizer statistics, connect to the DB instance as the master user, and run the `DBMS_STATS.GATHER_DICTIONARY_STATS` procedure, as in the following example.

```
EXEC DBMS_STATS.GATHER_DICTIONARY_STATS;
```

For more information, see [Gathering optimizer statistics to decrease Oracle database downtime](#) in the Oracle documentation.

## Allowing major upgrades

A major engine version upgrade might be incompatible with your application. The upgrade is irreversible. If you specify a major version for the `EngineVersion` parameter that is different from the current major version, you must allow major version upgrades.

If you upgrade a major version using the CLI command [modify-db-instance](#), specify `--allow-major-version-upgrade`. This setting isn't persistent, so you must specify `--allow-major-version-upgrade` whenever you perform a major upgrade. This parameter has no impact on upgrades of minor engine versions. For more information, see [Upgrading a DB instance engine version \(p. 272\)](#).

If you upgrade a major version using the console, you don't need to choose an option to allow the upgrade. Instead, the console displays a warning that major upgrades are irreversible.

## Oracle minor version upgrades

A minor version upgrade applies an Oracle Database Patch Set Update (PSU) or Release Update (RU) in a major version.

An Amazon RDS for Oracle DB instance is scheduled to be upgraded automatically during its next maintenance window when it meets the following conditions:

- The DB instance has the **Auto minor version upgrade** option enabled.
- The DB instance is not running the latest minor DB engine version.

The DB instance is upgraded to the latest quarterly PSU or RU four to six weeks after it is made available by Amazon RDS for Oracle. For more information about PSUs and RUs, see [Oracle database engine release notes \(p. 1257\)](#).

The following minor version upgrades aren't supported.

Current version	Upgrade not supported
12.1.0.2.v6	12.1.0.2.v7
12.1.0.2.v5	12.1.0.2.v7
12.1.0.2.v5	12.1.0.2.v6

### Note

Minor version downgrades aren't supported.

## Oracle SE2 upgrade paths

The following table shows supported upgrade paths to Standard Edition Two (SE2). For more information about the License Included and Bring Your Own License (BYOL) models, see [Oracle licensing options \(p. 1000\)](#).

Your existing configuration	Supported SE2 configuration
12.2.0.1 SE2, BYOL	12.2.0.1 SE2, BYOL or License Included
12.1.0.2 SE2, BYOL	12.2.0.1 SE2, BYOL or License Included 12.1.0.2 SE2, BYOL or License Included

To upgrade from your existing configuration to a supported SE2 configuration, use a supported upgrade path. For more information, see [Major version upgrades \(p. 1223\)](#).

## Considerations for Oracle DB upgrades

Before upgrading, review the implications for option groups, parameter groups, and time zones.

### Option group considerations

If your DB instance uses a custom option group, sometimes Amazon RDS can't automatically assign a new option group. For example, this situation occurs when you upgrade to a new major version. In such cases, specify a new option group when you upgrade. We recommend that you create a new option group, and add the same options to it as in your existing custom option group.

For more information, see [Creating an option group \(p. 215\)](#) or [Copying an option group \(p. 216\)](#).

If your DB instance uses a custom option group that contains the APEX option, you can sometimes reduce the upgrade time. To do this, upgrade your version of APEX at the same time as your DB instance. For more information, see [Upgrading the APEX version \(p. 1160\)](#).

### Parameter group considerations

If your DB instance uses a custom parameter group, sometimes Amazon RDS can't automatically assign your DB instance a new parameter group. For example, this situation occurs when you upgrade to a new major version. In such cases, make sure to specify a new parameter group when you upgrade. We recommend that you create a new parameter group, and configure the parameters as in your existing custom parameter group.

For more information, see [Creating a DB parameter group \(p. 230\)](#) or [Copying a DB parameter group \(p. 237\)](#).

### Time zone considerations

You can use the time zone option to change the *system time zone* used by your Oracle DB instance. For example, you might change the time zone of a DB instance to be compatible with an on-premises environment, or a legacy application. The time zone option changes the time zone at the host level. Amazon RDS for Oracle updates the system time zone automatically throughout the year. For more information about the system time zone, see [Oracle time zone \(p. 1213\)](#).

When you create an Oracle DB instance, the database automatically sets the *database time zone*. The database time zone is also known as the Daylight Saving Time (DST) time zone. The database time zone is distinct from the system time zone.

Between Oracle Database releases, patch sets or individual patches may include new DST versions. These patches reflect the changes in transition rules for various time zone regions. For example, a government

might change when DST takes effect. Changes to DST rules may affect existing data of the `TIMESTAMP WITH TIME ZONE` data type.

If you upgrade an RDS for Oracle instance, Amazon RDS does not upgrade the database time zone automatically. To upgrade the database time zone manually, create a new Oracle DB instance that has the desired DST patch. Then migrate the data from your current instance to the new instance. You can migrate data using several techniques, including the following:

- Oracle GoldenGate
- AWS Database Migration Service
- Oracle Data Pump
- Original Export/Import (desupported for general use)

**Note**

When you migrate data using Oracle Data Pump, the utility raises the error ORA-39405 when the target time zone version is lower than the source time zone version.

For more information, see [TIMESTAMP WITH TIMEZONE restrictions](#) in the Oracle documentation.

## Preparing for the automatic upgrade of Oracle Database 18c

On July 1, 2021, Amazon RDS plans to begin automatically upgrading Oracle Database 18c instances to Oracle Database 19c. The automatic upgrades are not guaranteed to occur in your maintenance window. All Oracle Database 18c instances, including reserved instances, will move to the latest available Release Update (RU).

Before the automatic upgrades begin, we highly recommend that you upgrade your existing Oracle Database 18c DB instances to Oracle Database 19c manually. When you upgrade manually, you can validate that your applications work correctly. To avoid the automatic upgrade, use one of the following strategies before July 1, 2021.

**Topics**

- [Upgrade your Oracle Database 18c DB instance \(p. 1226\)](#)
- [Upgrade your Oracle Database 18c DB snapshots \(p. 1226\)](#)
- [Downgrade your Oracle Database 18c DB instance \(p. 1227\)](#)

## Upgrade your Oracle Database 18c DB instance

You can upgrade your Oracle Database 18c instance to Oracle Database 19c. Before upgrading, consider the following:

- Your SQL statements might perform differently after the upgrade. If so, you can use the `OPTIMIZER_FEATURES_ENABLE` parameter to retain the behavior of the Oracle Database 18c optimizer. For more information, see [Influencing the Optimizer](#) in the Oracle documentation.
- If you have Extended Support for Oracle Database 18c on the BYOL model, consider the implications. In this case, you must have Extended Support agreements from Oracle Support for Oracle Database 19c. For details on licensing and support requirements for BYOL, see [Amazon RDS for Oracle FAQs](#).

## Upgrade your Oracle Database 18c DB snapshots

You can upgrade your existing snapshots to Oracle Database 19c, and then restore them. For more information, see [Upgrading an Oracle DB snapshot \(p. 1229\)](#).

If you plan to upgrade using snapshots, the planned deadline to avoid the automatic upgrade is June 30, 2021.

## Downgrade your Oracle Database 18c DB instance

You may decide not to upgrade your DB instances to Oracle Database 19c. In this case, you can downgrade your instance to Oracle Database Release 1 (12.1.0.2) or Release 2 (12.2.0.1). Use any of the following techniques:

- Oracle Data Pump
- AWS Database Migration Service (DMS)
- Any supported logical replication tool

For more information about import options, see [Importing data into Oracle on Amazon RDS \(p. 1118\)](#).

## Testing an Oracle DB upgrade

Before you upgrade your DB instance to a major version, thoroughly test your database and all applications that access the database for compatibility with the new version. We recommend that you use the following procedure.

### To test a major version upgrade

1. Review the Oracle upgrade documentation for the new version of the database engine to see if there are compatibility issues that might affect your database or applications. For more information, see [Database Upgrade Guide](#) in the Oracle documentation.
2. If your DB instance uses a custom option group, create a new option group compatible with the new version you are upgrading to. For more information, see [Option group considerations \(p. 1225\)](#).
3. If your DB instance uses a custom parameter group, create a new parameter group compatible with the new version you are upgrading to. For more information, see [Parameter group considerations \(p. 1225\)](#).
4. Create a DB snapshot of the DB instance to be upgraded. For more information, see [Creating a DB snapshot \(p. 349\)](#).
5. Restore the DB snapshot to create a new test DB instance. For more information, see [Restoring from a DB snapshot \(p. 352\)](#).
6. Modify this new test DB instance to upgrade it to the new version, by using one of the following methods:
  - [Console \(p. 272\)](#)
  - [AWS CLI \(p. 273\)](#)
  - [RDS API \(p. 273\)](#)
7. Perform testing:
  - Run as many of your quality assurance tests against the upgraded DB instance as needed to ensure that your database and application work correctly with the new version.
  - Implement any new tests needed to evaluate the impact of any compatibility issues that you identified in step 1.
  - Test all stored procedures, functions, and triggers.
  - Direct test versions of your applications to the upgraded DB instance. Verify that the applications work correctly with the new version.
  - Evaluate the storage used by the upgraded instance to determine if the upgrade requires additional storage. You might need to choose a larger instance class to support the new version in production. For more information, see [DB instance classes \(p. 7\)](#).

8. If all tests pass, upgrade your production DB instance. We recommend that you confirm that the DB instance working correctly before allowing write operations to the DB instance.

## Upgrading an Oracle DB instance

For information about manually or automatically upgrading an Oracle DB instance, see [Upgrading a DB instance engine version \(p. 272\)](#).

# Upgrading an Oracle DB snapshot

If you have existing manual DB snapshots, you can upgrade them to a later version of the Oracle database engine.

When Oracle stops providing patches for a version, and Amazon RDS deprecates the version, you can upgrade your snapshots that correspond to the deprecated version. For more information, see [Oracle engine version management \(p. 1222\)](#).

The following snapshot upgrades are currently supported.

Current snapshot version	Supported snapshot upgrade
12.1.0.1	12.1.0.2.v8
11.2.0.4	12.1.0.2, 12.2.0.1, 18c, and 19c when the following conditions are met: <ul style="list-style-type: none"><li>• The minor version is not a downgrade.</li><li>• You upgrade the snapshot to the RU, RUR, or PSU for July 2020 or later. For specific version numbers, see <a href="#">Oracle database engine release notes (p. 1257)</a>.</li></ul>
11.2.0.3	11.2.0.4.v11
11.2.0.2	11.2.0.4.v12

Amazon RDS supports upgrading snapshots in all AWS Regions.

## Console

### To upgrade an Oracle DB snapshot

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Snapshots**, and then select the DB snapshot that you want to upgrade.
3. For **Actions**, choose **Upgrade snapshot**. The **Upgrade snapshot** page appears.
4. Choose the **New engine version** to upgrade the snapshot to.
5. (Optional) For **Option group**, choose the option group for the upgraded DB snapshot. The same option group considerations apply when upgrading a DB snapshot as when upgrading a DB instance. For more information, see [Option group considerations \(p. 1225\)](#).
6. Choose **Save changes** to save your changes.

During the upgrade process, all snapshot actions are disabled for this DB snapshot. Also, the DB snapshot status changes from **available** to **upgrading**, and then changes to **active** upon completion. If the DB snapshot can't be upgraded because of snapshot corruption issues, the status changes to **unavailable**. You can't recover the snapshot from this state.

#### Note

If the DB snapshot upgrade fails, the snapshot is rolled back to the original state with the original version.

## AWS CLI

To upgrade an Oracle DB snapshot by using the AWS CLI, call the [modify-db-snapshot](#) command with the following parameters:

- `--db-snapshot-identifier` – The name of the DB snapshot.
- `--engine-version` – The version to upgrade the snapshot to.

You might also need to include the following parameter. The same option group considerations apply when upgrading a DB snapshot as when upgrading a DB instance. For more information, see [Option group considerations \(p. 1225\)](#).

- `--option-group-name` – The option group for the upgraded DB snapshot.

### Example

The following example upgrades a DB snapshot.

For Linux, macOS, or Unix:

```
aws rds modify-db-snapshot \
 --db-snapshot-identifier mydbsnapshot \
 --engine-version 11.2.0.4.v12 \
 --option-group-name default:oracle-se1-11-2
```

For Windows:

```
aws rds modify-db-snapshot ^
 --db-snapshot-identifier mydbsnapshot ^
 --engine-version 11.2.0.4.v12 ^
 --option-group-name default:oracle-se1-11-2
```

## RDS API

To upgrade an Oracle DB snapshot by using the Amazon RDS API, call the [ModifyDBSnapshot](#) operation with the following parameters:

- `DBSnapshotIdentifier` – The name of the DB snapshot.
- `EngineVersion` – The version to upgrade the snapshot to.

You might also need to include the `OptionGroupName` parameter. The same option group considerations apply when upgrading a DB snapshot as when upgrading a DB instance. For more information, see [Option group considerations \(p. 1225\)](#).

# Using your Oracle DB instance with third-party software

This section provides information about tools and third-party software for Oracle DB instances on Amazon RDS.

## Topics

- [Setting up Amazon RDS to host tools and third-party software for Oracle \(p. 1231\)](#)
- [Using Oracle GoldenGate with Amazon RDS \(p. 1237\)](#)
- [Using the Oracle Repository Creation Utility on Amazon RDS for Oracle \(p. 1249\)](#)
- [Installing a Siebel database on Oracle on Amazon RDS \(p. 1254\)](#)

## Setting up Amazon RDS to host tools and third-party software for Oracle

You can use Amazon RDS to host an Oracle DB instance that supports software and components such as the following:

- Siebel Customer Relationship Management (CRM)
- Oracle Fusion Middleware Metadata — installed by the Repository Creation Utility (RCU)

The following procedures help you create an Oracle DB instance on Amazon RDS that you can use to host additional software and components for Oracle.

## Creating a VPC for use with an Oracle database

In the following procedure, you create a virtual private cloud (VPC) based on the Amazon VPC service, a private subnet, and a security group. Your Amazon RDS DB instance needs to be available only to your middle-tier components, and not to the public internet. Thus, your Amazon RDS DB instance is hosted in a private subnet, providing greater security.

### To create a VPC based on Amazon VPC

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the upper-right corner of the AWS Management Console, choose the AWS Region for your VPC. This example uses the US West (Oregon) region.
3. In the upper-left corner, choose **VPC Dashboard**, and then choose **Start VPC Wizard**.
4. On the page **Step 1: Select a VPC Configuration**, choose **VPC with Public and Private Subnets**, and then choose **Select**.
5. On the page **Step 2: VPC with Public and Private Subnets**, shown following, set the following values.

Option	Value
IPv4 CIDR block	10.0.0.0/16 For more information about selecting CIDR blocks for your VPC, see <a href="#">VPC sizing</a> .

Option	Value
<b>IPv6 CIDR block</b>	<b>No IPv6 CIDR Block</b>
<b>VPC name</b>	The name for your VPC, for example <b>vpc-1</b> .
<b>Public subnet's IPv4 CIDR</b>	10.0.0.0/24 For more information about subnet sizing, see <a href="#">Subnet sizing</a> .
<b>Availability Zone</b>	An Availability Zone for your AWS Region.
<b>Public subnet name</b>	The name for your public subnet, for example <b>subnet-public-1</b> .
<b>Private subnet's IPv4 CIDR</b>	10.0.1.0/24 For more information about subnet sizing, see <a href="#">Subnet sizing</a> .
<b>Availability Zone</b>	An Availability Zone for your AWS Region.
<b>Private subnet name</b>	The name for your private subnet, for example <b>subnet-private-1</b> .
<b>Instance type</b>	An instance type for your NAT instance, for example <b>t2.small</b> . <b>Note</b> If you don't see <b>Instance type</b> in the console, choose <b>Use a NAT instance instead</b> .
<b>Key pair name</b>	No key pair
<b>Service endpoints</b>	None
<b>Enable DNS hostnames</b>	Yes
<b>Hardware tenancy</b>	Default

## Step 2: VPC with Public and Private Subnets

IPv4 CIDR block: (65531 IP addresses available)

IPv6 CIDR block:  No IPv6 CIDR Block  Amazon provided IPv6 CIDR block

VPC name:

Public subnet's IPv4 CIDR: (251 IP addresses available)

Availability Zone:

Public subnet name:

Private subnet's IPv4 CIDR: (251 IP addresses available)

Availability Zone:

Private subnet name:

You can add more subnets after AWS creates the VPC.

Specify the details of your NAT instance ([Instance rates apply](#)). [Use a NAT gateway instead](#)

Instance type:

Key pair name:

Service endpoints

Enable DNS hostnames:  Yes  No

Hardware tenancy:

[Cancel and Exit](#) [Back](#) [Create VPC](#)

6. Choose **Create VPC**.

An Amazon RDS DB instance in a VPC requires at least two private subnets or at least two public subnets, to support Multi-AZ deployment. For more information about working with multiple Availability Zones, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#). Because your database is private, add a second private subnet to your VPC.

### To create an additional subnet

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the upper-right corner of the AWS Management Console, confirm that you are in the correct AWS Region for your VPC.
3. In the upper-left corner, choose **VPC Dashboard**, choose **Subnets**, and then choose **Create Subnet**.

4. On the **Create Subnet** page, set the following values.

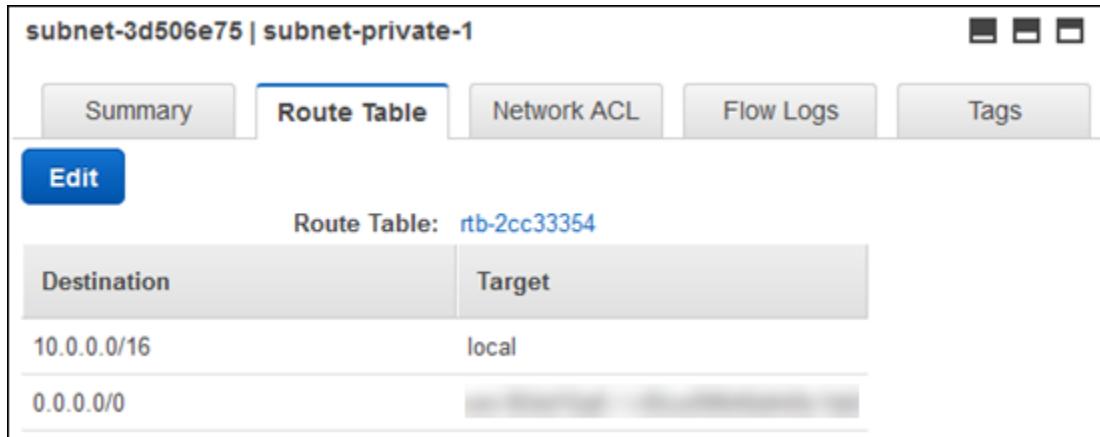

Option	Value
<b>Name tag</b>	The name for your second private subnet, for example <b>subnet-private-2</b> .
<b>VPC</b>	Your VPC, for example <b>vpc-1</b> .
<b>Availability Zone</b>	An Availability Zone for your AWS Region. <b>Note</b> Choose an Availability Zone different from the one that you chose for the first private subnet.
<b>CIDR block</b>	<b>10.0.2.0/24</b>

5. Choose **Yes, Create**.

Both private subnets must use the same route table. In the following procedure, you check to make sure the route tables match, and if not you edit one of them.

**To ensure the subnets use the same route table.**

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the upper-right corner of the AWS Management Console, confirm that you are in the correct AWS Region for your VPC.
3. In the upper-left corner, choose **VPC Dashboard**, choose **Subnets**, and then choose your first private subnet, for example **subnet-private-1**.
4. At the bottom of the console, choose the **Route Table** tab, shown following.

5. Make a note of the route table, for example **rtb-0d9fc668**.
6. In the list of subnets, choose the second private subnet, for example **subnet-private-2**.
7. At the bottom of the console, choose the **Route Table** tab.
8. If the route table for the second subnet is not the same as the route table for the first subnet, edit it to match:
  - Choose **Edit**.
  - For **Change to**, choose the route table that matches your first subnet.
  - Choose **Save**.

A security group acts as a virtual firewall for your DB instance to control inbound and outbound traffic. In the following procedure, you create a security group for your DB instance. For more information about security groups, see [Security groups for your VPC](#).

### To create a VPC security group for a private Amazon RDS DB instance

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the upper-right corner of the AWS Management Console, confirm that you are in the correct AWS Region for your VPC.
3. In the upper-left corner, choose **VPC Dashboard**, choose **Security Groups**, and then choose **Create Security Group**.
4. On the page **Create Security Group**, set the following values.

Option	Value
<b>Name tag</b>	The name for your security group, for example <b>sgdb-1</b> .
<b>Group name</b>	The name for your security group, for example <b>sgdb-1</b> .
<b>Description</b>	A description for your security group.
<b>VPC</b>	Your VPC, for example <b>vpc-1</b> .

5. Choose **Yes, Create**.

In the following procedure, you add rules to your security group to control inbound traffic to your DB instance. For more information about inbound rules, see [Security group rules](#).

### To add inbound rules to the security group

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the upper-right corner of the AWS Management Console, confirm that you are in the correct AWS Region for your VPC.
3. In the upper-left corner, choose **VPC Dashboard**, choose **Security Groups**, and then choose your security group, for example **sgdb-1**.
4. At the bottom of the console, choose the **Inbound Rules** tab, and then choose **Edit**.
5. Set these values, as shown following.

Option	Value
<b>Type</b>	Oracle (1521)
<b>Protocol</b>	TCP (6)
<b>Port Range</b>	1521
<b>Source</b>	The identifier of your security group. When you choose the box, you see the name of your security group, for example <b>sgdb-1</b> .

6. Choose **Save**.

## Creating an Oracle DB instance

You can use Amazon RDS to host an Oracle DB instance. When you create the new DB instance, specify the VPC and security group you created previously using the instructions in [Creating a VPC for use with an Oracle database \(p. 1231\)](#). Also, choose **No** for **Publicly accessible**.

For information about creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

## Additional Amazon RDS interfaces

In the preceding procedures, we use the AWS Management Console to perform tasks. Amazon Web Services also provides the AWS Command Line Interface (AWS CLI), and an application programming interface (API). You can use the AWS CLI or the API to automate many of the tasks for managing Amazon RDS, including tasks to manage an Oracle DB instance with Amazon RDS.

For more information, see [AWS Command Line Interface reference for Amazon RDS](#) and [Amazon RDS API Reference](#).

## Using Oracle GoldenGate with Amazon RDS

Oracle GoldenGate (GoldenGate) collects, replicates, and manages transactional data between databases. It is a log-based change data capture (CDC) and replication software package used with Oracle databases for online transaction processing (OLTP) systems. GoldenGate creates trail files that contain the most recent changed data from the source database and then pushes these files to the target database. Amazon RDS supports GoldenGate for Oracle Database Standard Edition Two (SE2) and Enterprise Edition (EE).

You can use GoldenGate with Amazon RDS to do the following:

- Active-Active database replication
- Zero-downtime migration and upgrades
- Disaster recovery
- Data protection
- In-region and cross-region replication

When working with GoldenGate on Amazon RDS, consider the following:

- You are responsible for setting up and managing GoldenGate for use with Amazon RDS.
- You are responsible for managing GoldenGate licensing (BYOL) for use with Amazon RDS in all AWS regions. For more information, see [Oracle licensing options \(p. 1000\)](#).
- Amazon RDS supports GoldenGate version 11.2.1 and later.
- Amazon RDS supports migration and replication across Oracle databases using GoldenGate. We do not support nor prevent customers from migrating or replicating across heterogeneous databases.
- You can use GoldenGate on Amazon RDS for Oracle DB instances that use Oracle Transparent Data Encryption (TDE). To maintain the integrity of replicated data, you should configure encryption on the GoldenGate hub using EBS encrypted volumes or trail file encryption. You should also configure encryption for data sent between the GoldenGate hub and the source and target database instances. Amazon RDS for Oracle DB instances support encryption with [Oracle Secure Sockets Layer \(p. 1194\)](#) or [Oracle native network encryption \(p. 1188\)](#).
- GoldenGate DDL is supported with GoldenGate version 12.1 and later when using Integrated capture mode.

## Overview

The GoldenGate architecture for use with Amazon RDS consists of three decoupled modules. The source database can be either an on-premises Oracle database, an Oracle database on an Amazon EC2 instance, or an Oracle database on an Amazon RDS DB instance. You also work with a GoldenGate hub, which moves transaction information from the source database to the target database. Your hub can be either of these:

- An Amazon EC2 instance with Oracle Database and GoldenGate installed
- An on-premises Oracle installation.

You can have more than one Amazon EC2 hub, and we recommend that you use two hubs if you are using GoldenGate for cross-region replication.

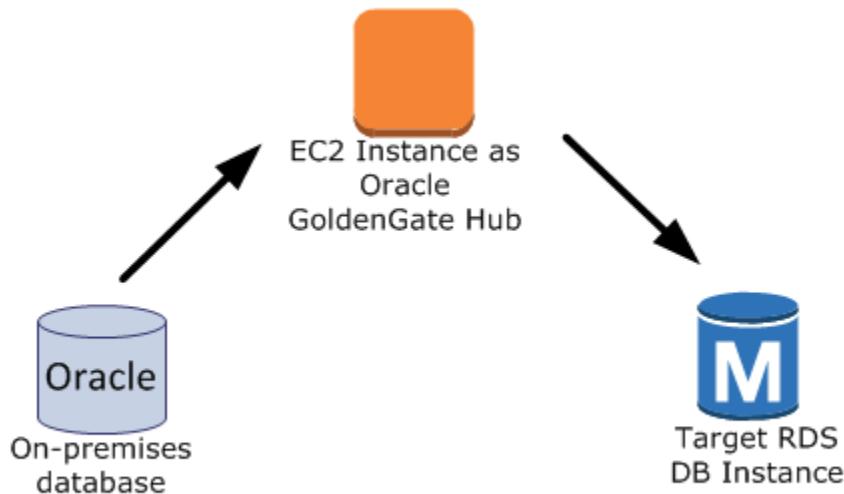

Your target database can be on either an Amazon RDS DB instance, an Amazon EC2 instance, or an on-premises location.

GoldenGate on Amazon RDS supports the following common scenarios:

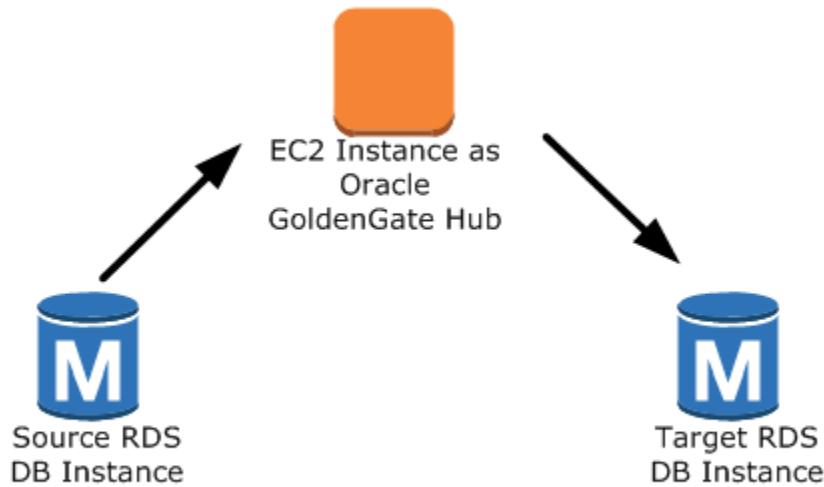

Scenario 1: An on-premises Oracle source database and on-premises GoldenGate hub, that provides data to a target Amazon RDS DB instance.

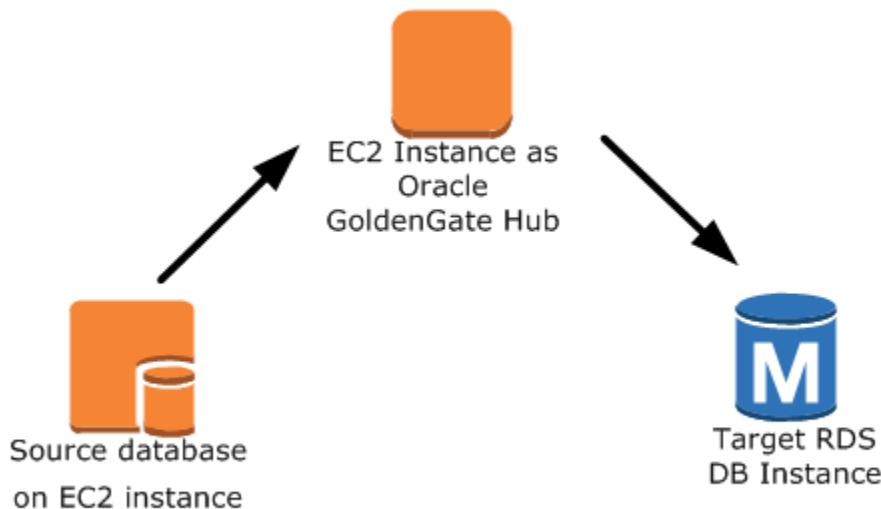

Scenario 2: An on-premises Oracle database that acts as the source database, connected to an Amazon EC2 instance hub that provides data to a target Amazon RDS DB instance.

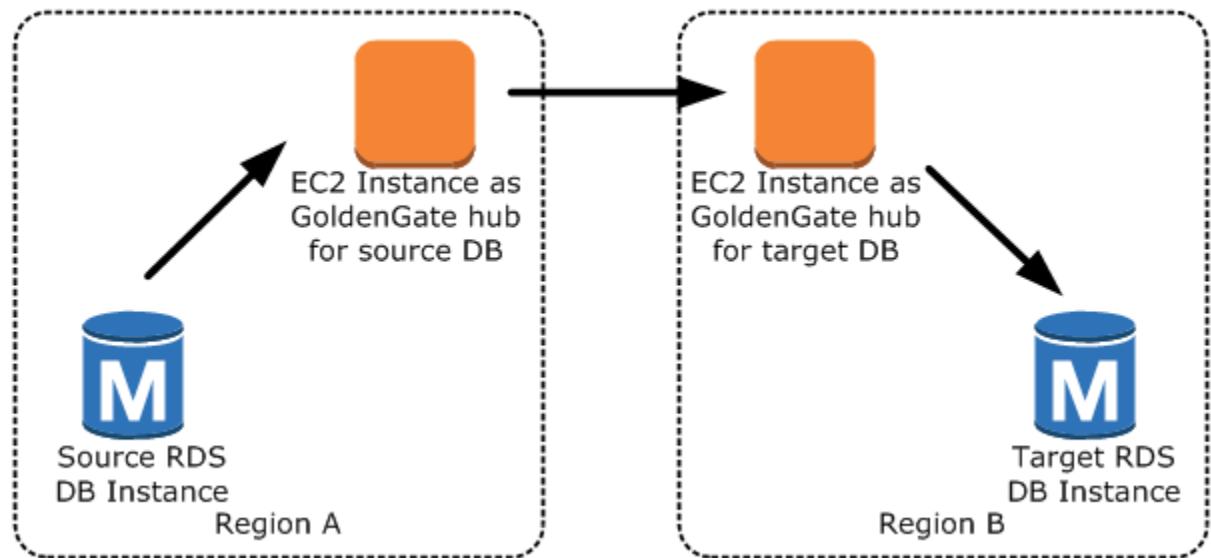

Scenario 3: An Oracle database on an Amazon RDS DB instance that acts as the source database, connected to an Amazon EC2 instance hub that provides data to a target Amazon RDS DB instance.

Scenario 4: An Oracle database on an Amazon EC2 instance that acts as the source database, connected to an Amazon EC2 instance hub that provides data to a target Amazon RDS DB instance.

Scenario 5: An Oracle database on an Amazon RDS DB instance connected to an Amazon EC2 instance hub in the same AWS Region. In this scenario, the hub is connected to an Amazon EC2 instance hub in a different AWS Region. This second hub provides data to the target Amazon RDS DB instance in the same AWS Region as the second Amazon EC2 instance hub.

**Note**

Any issues that affect running GoldenGate on an on-premises environment also affect running GoldenGate on AWS. We strongly recommend that you monitor the GoldenGate hub to ensure that EXTRACT and REPLICAT are resumed if a failover occurs. Because the GoldenGate hub is run on an Amazon EC2 instance, Amazon RDS does not manage the GoldenGate hub and cannot ensure that it is running.

You can use GoldenGate using Amazon RDS to upgrade to major versions of Oracle. For example, you can use GoldenGate with Amazon RDS to upgrade from an Oracle9i on-premises database to Oracle Database 19c on an Amazon RDS DB instance.

To set up GoldenGate using Amazon RDS, you configure the hub on the Amazon EC2 instance, and then configure the source and target databases. The following steps show how to set up GoldenGate for use with Amazon RDS. Each step is explained in detail in the following sections:

- [Setting up a GoldenGate hub on Amazon EC2 \(p. 1240\)](#)
- [Setting up a source database for use with GoldenGate on Amazon RDS \(p. 1241\)](#)
- [Setting up a target database for use with GoldenGate on Amazon RDS \(p. 1243\)](#)
- [Working with the EXTRACT and REPLICAT utilities of GoldenGate \(p. 1245\)](#)

## Setting up a GoldenGate hub on Amazon EC2

To create a GoldenGate hub on an Amazon EC2 instance, you complete several steps. First, you create an Amazon EC2 instance with a full client installation of Oracle RDBMS. The Amazon EC2 instance must also have Oracle GoldenGate software installed. The exact software versions depend on the source and target database versions. For more information about installing GoldenGate, see the [Oracle documentation](#)

The Amazon EC2 instance that serves as the GoldenGate hub stores and processes the transaction information from the source database into trail files. To support this process, make sure that you meet the following conditions:

- You have allocated enough storage for the trail files
- The Amazon EC2 instance has enough processing power to manage the amount of data.

- The EC2 instance has enough memory to store the transaction information before it's written to the trail file.

The following tasks set up a GoldenGate hub on an Amazon EC2 instance; each task is explained in detail in this section:

1. Create the GoldenGate subdirectories.
2. Update the GLOBALS parameter file.
3. Configure the *mgr.prm* file and start the manager.

Create subdirectories in the GoldenGate directory using the Amazon EC2 command line shell and *ggsci*, the GoldenGate command interpreter. The subdirectories are created under the *gg* directory and include directories for parameter, report, and checkpoint files.

```
prompt$ cd /gg
prompt$./ggsci
GGSCI> CREATE SUBDIRS
```

Create a GLOBALS parameter file using the Amazon EC2 command line shell. Parameters that affect all GoldenGate processes are defined in the GLOBALS parameter file. The following example creates the necessary file:

```
$ cd $GGHOME
$ vi GLOBALS
CheckpointTable oggadm1.oggchkpt
```

The last step in setting up and configuring the GoldenGate hub is to configure the *manager*. Add the following lines to the *mgr.prm* file, then start the *manager* using *ggsci*:

```
PORt 8199
PurgeOldExtracts ./dirdat/*, UseCheckpoints, MINKEEPDAYS 5
```

```
GGSCI> start mgr
```

Once you have completed these steps, the GoldenGate hub is ready for use. Next, you set up the source and target databases.

## Setting up a source database for use with GoldenGate on Amazon RDS

When your source database is running Oracle Database 12c or later, complete the following tasks to set up a source database for use with GoldenGate:

1. Set the `ENABLE_GOLDENGATE_REPLICATION` parameter to *True*. This parameter turns on supplemental logging for the source database. If your source database is on an Amazon RDS DB instance, make sure that you have a parameter group assigned to the DB instance with the `ENABLE_GOLDENGATE_REPLICATION` parameter set to *true*. For more information about the `ENABLE_GOLDENGATE_REPLICATION` parameter, see the [Oracle documentation](#).
2. Set the retention period for archived redo logs for the GoldenGate source database.
3. Create a GoldenGate user account on the source database.
4. Grant the necessary privileges to the GoldenGate user.
5. Add a TNS alias for the source database to the `tnsnames.ora` file on the GoldenGate hub.

## Enable supplemental logging on the source DB

The `ENABLE_GOLDENGATE_REPLICATION` parameter, when set to *True*, turns on supplemental logging for the source database and configures the required GoldenGate permissions. If your source database is on an Amazon RDS DB instance, make sure that you have a parameter group assigned to the DB instance with `ENABLE_GOLDENGATE_REPLICATION` set to *true*. For more information about `ENABLE_GOLDENGATE_REPLICATION`, see the [Oracle documentation](#).

## Set the log retention period on the source DB

The source database must also retain archived redo logs. For example, set the retention period for archived redo logs to 24 hours.

```
exec rdsadmin.rdsadmin_util.set_configuration('archivelog retention hours', 24);
```

Specify the duration for log retention in hours. The duration should exceed any potential downtime of the source instance, any potential period of communication, and any potential period of networking issues for the source instance. Such a duration lets Oracle GoldenGate recover logs from the source instance as needed.

The absolute minimum value required is one hour of logs retained. If you don't have log retention enabled, or if the retention value is too small, you receive the following message.

```
2014-03-06 06:17:27 ERROR OGG-00446 error 2 (No such file or directory)
opening redo log /rdsdbdata/db/GGTEST3_A/onlinelog/o1_mf_2_9k4bp1n6_.log
for sequence 1306Not able to establish initial position for begin time 2014-03-06
06:16:55.
```

The logs are retained on your DB instance. Ensure that you have sufficient storage on your instance for the files. To see how much space you have used in the last *X* hours, use the following query, replacing *X* with the number of hours.

```
SELECT SUM(BLOCKS * BLOCK_SIZE) BYTES FROM V$ARCHIVED_LOG
WHERE NEXT_TIME>=SYSDATE-X/24 AND DEST_ID=1;
```

## Create a user account on the source

GoldenGate runs as a database user and requires the appropriate database privileges to access the redo and archive logs for the source database. To provide these, create a GoldenGate user account on the source database. For more information about the permissions for a GoldenGate user account, see the sections 4, section 4.4, and table 4.1 in the [Oracle documentation](#).

The following statements create a user account named `oggadm1`.

```
CREATE TABLESPACE administrator;
CREATE USER oggadm1 IDENTIFIED BY "password"
 DEFAULT TABLESPACE ADMINISTRATOR TEMPORARY TABLESPACE TEMP;
```

## Grant account privileges on the source DB

Grant the necessary privileges to the GoldenGate user account using the SQL command `grant` and the `rdsadmin.rdsadmin_util` procedure `grant_sys_object`. The following statements grant privileges to a user named `oggadm1`.

```
GRANT CREATE SESSION, ALTER SESSION TO oggadm1;
GRANT RESOURCE TO oggadm1;
```

```
GRANT SELECT ANY DICTIONARY TO oggadm1;
GRANT FLASHBACK ANY TABLE TO oggadm1;
GRANT SELECT ANY TABLE TO oggadm1;
GRANT SELECT_CATALOG_ROLE TO rds_master_user_name WITH ADMIN OPTION;
exec rdsadmin.rdsadmin_util.grant_sys_object ('DBA_CLUSTERS', 'OGGADM1');
GRANT EXECUTE ON DBMS_FLASHBACK TO oggadm1;
GRANT SELECT ON SYS.V_$DATABASE TO oggadm1;
GRANT ALTER ANY TABLE TO oggadm1;
```

Finally, grant the privileges needed by a user account to be a GoldenGate administrator. The package that you use to perform the grant, dbms\_goldengate\_auth or rdsadmin\_dbms\_goldengate\_auth, depends on the Oracle DB engine version.

- For Oracle DB versions that are *earlier than* Oracle Database 12c Release 2 (12.2), run the following PL/SQL program.

```
exec dbms_goldengate_auth.grant_admin_privilege (grantee=>'OGGADM1',
 privilege_type=>'capture',
 grant_select_privileges=>true,
 do_grants=>TRUE);
```

- For Oracle DB versions that are *later than or equal to* Oracle Database 12c Release 2 (12.2), which requires patch level 12.2.0.1.ru-2019-04.rur-2019-04.r1 or later, run the following PL/SQL program.

```
exec rdsadmin.rdsadmin_dbms_goldengate_auth.grant_admin_privilege (grantee=>'OGGADM1',
 privilege_type=>'capture',
 grant_select_privileges=>true,
 do_grants=>TRUE);
```

To revoke privileges, use the procedure `revoke_admin_privilege` in the same package.

## Add a TNS alias for the source DB

Add the following entry to `$ORACLE_HOME/network/admin/tnsnames.ora` in the Oracle Home to be used by the `EXTRACT` process. For more information on the `tnsnames.ora` file, see the [Oracle documentation](#).

```
OGGSOURCE=
 (DESCRIPTION=
 (ENABLE=BROKEN)
 (ADDRESS_LIST=
 (ADDRESS=(PROTOCOL=TCP)(HOST=goldengate-source.abcdef12345.us-
west-2.rds.amazonaws.com)(PORT=8200)))
 (CONNECT_DATA=(SID=ORCL))
)
```

## Setting up a target database for use with GoldenGate on Amazon RDS

The following tasks set up a target DB instance for use with GoldenGate:

1. Set the `ENABLE_GOLDENGATE_REPLICATION` parameter to `TRUE`. If your target database is on an Amazon RDS DB instance, make sure that you have a parameter group assigned to the DB instance with the `ENABLE_GOLDENGATE_REPLICATION` parameter set to `TRUE`. For more information about the `ENABLE_GOLDENGATE_REPLICATION` parameter, see the [Oracle documentation](#).
2. Create and manage a GoldenGate user account on the target database

3. Grant the necessary privileges to the GoldenGate user
4. Add a TNS alias for the target database to `tnsnames.ora` on the GoldenGate hub.

## Create a user account on the target DB

GoldenGate runs as a database user and requires the appropriate database privileges. To make sure it has these, create a GoldenGate user account on the target database.

The following statements create a user named `oggadm1`:

```
CREATE TABLESPACE administrator;
CREATE TABLESPACE administrator_idx;
CREATE USER oggadm1 IDENTIFIED BY "password"
 DEFAULT TABLESPACE administrator
 TEMPORARY TABLESPACE temp;
ALTER USER oggadm1 QUOTA UNLIMITED ON administrator;
ALTER USER oggadm1 QUOTA UNLIMITED ON administrator_idx;
```

## Grant account privileges on the target DB

Grant necessary privileges to the GoldenGate user account on the target DB. In the following example, you grant privileges to `oggadm1`.

```
GRANT CREATE SESSION TO oggadm1;
GRANT ALTER SESSION TO oggadm1;
GRANT CREATE CLUSTER TO oggadm1;
GRANT CREATE INDEXTYPE TO oggadm1;
GRANT CREATE OPERATOR TO oggadm1;
GRANT CREATE PROCEDURE TO oggadm1;
GRANT CREATE SEQUENCE TO oggadm1;
GRANT CREATE TABLE TO oggadm1;
GRANT CREATE TRIGGER TO oggadm1;
GRANT CREATE TYPE TO oggadm1;
GRANT SELECT ANY DICTIONARY TO oggadm1;
GRANT CREATE ANY TABLE TO oggadm1;
GRANT ALTER ANY TABLE TO oggadm1;
GRANT LOCK ANY TABLE TO oggadm1;
GRANT SELECT ANY TABLE TO oggadm1;
GRANT INSERT ANY TABLE TO oggadm1;
GRANT UPDATE ANY TABLE TO oggadm1;
GRANT DELETE ANY TABLE TO oggadm1;
```

Finally, grant the privileges needed by a user account to be a GoldenGate administrator. The package that you use to perform the grant, `dbms_goldengate_auth` or `rdsadmin_dbms_goldengate_auth`, depends on the Oracle DB engine version.

- For Oracle DB versions that are *earlier than* Oracle Database 12c Release 2 (12.2), run the following PL/SQL program.

```
exec dbms_goldengate_auth.grant_admin_privilege (grantee=>'OGGADM1',
 privilege_type=>'capture',
 grant_select_privileges=>true,
 do_grants=>TRUE);
```

- For Oracle DB versions that are *later than or equal to* Oracle Database 12c Release 2 (12.2), which requires patch level 12.2.0.1.ru-2019-04.rur-2019-04.r1 or later, run the following PL/SQL program.

```
exec rdsadmin.rdsadmin_dbms_goldengate_auth.grant_admin_privilege (grantee=>'OGGADM1',
```

```
privilege_type=>'capture',
grant_select_privileges=>true,
do_grants=>TRUE);
```

To revoke privileges, use the procedure `revoke_admin_privilege` in the same package.

## Add a TNS alias for the target DB

Add the following entry to `$ORACLE_HOME/network/admin/tnsnames.ora` in the Oracle Home to be used by the `REPLICAT` process. For more information on the `tnsname.ora` file, see the [Oracle documentation](#).

```
OGGTARGET=
 (DESCRIPTION=
 (ENABLE=BROKEN)
 (ADDRESS_LIST=
 (ADDRESS=(PROTOCOL=TCP)(HOST=goldengate-target.abcdef12345.us-west-2.rds.amazonaws.com)(PORT=8200)))
 (CONNECT_DATA=(SID=ORCL))
)
```

## Working with the EXTRACT and REPLICAT utilities of GoldenGate

The GoldenGate utilities `EXTRACT` and `REPLICAT` work together to keep the source and target databases in sync via incremental transaction replication using trail files. All changes that occur on the source database are automatically detected by `EXTRACT`, then formatted and transferred to trail files on the GoldenGate on-premises or EC2-instance hub. After initial load is completed, the data is read from these files and replicated to the target database by the `REPLICAT` utility.

### Running the GoldenGate EXTRACT utility

The `EXTRACT` utility retrieves, converts, and outputs data from the source database to trail files. `EXTRACT` queues transaction details to memory or to temporary disk storage. When the transaction is committed to the source database, `EXTRACT` flushes all of the transaction details to a trail file. The trail file routes these details to the GoldenGate on-premises or the EC2 instance hub and then to the target database.

The following tasks enable and start the `EXTRACT` utility:

1. Configure the `EXTRACT` parameter file on the GoldenGate hub (on-premises or EC2 instance). The following listing shows an example `EXTRACT` parameter file.

```
EXTRACT EABC
SETENV (ORACLE_SID=ORCL)
SETENV (NLSLANG=AL32UTF8)

USERID oggadm1@OGGSOURCE, PASSWORD XXXXXX
EXTTRAIL /path/to/goldengate/dirdat/ab

IGNOREREPLICATES
GETAPLOPS
TRANLOGOPTIONS EXCLUDEUSER OGGADM1

TABLE EXAMPLE.TABLE;
```

2. On the GoldenGate hub, launch the GoldenGate command line interface (*ggsci*). Log into the source database. The following example shows the format for logging in:

```
dblogin userid <user>@<db tnsname>
```

3. Add a checkpoint table for the database:

```
add checkpointtable
```

4. Add transdata to turn on supplemental logging for the database table:

```
add transdata <user>.<table>
```

Alternatively, you can add transdata to turn on supplemental logging for all tables in the database:

```
add transdata <user>.*
```

5. Using the *ggsci* command line, enable the **EXTRACT** utility using the following commands:

```
add extract <extract name> tranlog, INTEGRATED tranlog, begin now
add exttrail <path-to-trail-from-the param-file>
 extract <extractname-from-paramfile>,
 MEGABYTES Xm
```

6. Register the **EXTRACT** utility with the database so that the archive logs are not deleted. This allows you to recover old, uncommitted transactions if necessary. To register the **EXTRACT** utility with the database, use the following command:

```
register EXTRACT <extract process name>, DATABASE
```

7. To start the **EXTRACT** utility, use the following command:

```
start <extract process name>
```

## Running the GoldenGate REPLICAT utility

The **REPLICAT** utility is used to "push" transaction information in the trail files to the target database.

The following tasks enable and start the **REPLICAT** utility:

1. Configure the **REPLICAT** parameter file on the GoldenGate hub (on-premises or EC2 instance). The following listing shows an example **REPLICAT** parameter file.

```
REPLICAT RABC
SETENV (ORACLE_SID=ORCL)
SETENV (NLSLANG=AL32UTF8)

USERID oggadm1@OGGTARGET, password XXXXXX

ASSUMETARGETDEFS
MAP EXAMPLE.TABLE, TARGET EXAMPLE.TABLE;
```

2. Launch the GoldenGate command line interface (*ggsci*). Log into the target database. The following example shows the format for logging in.

```
dblogin userid <user>@<db tnsname>
```

3. Using the *ggsci* command line, add a checkpoint table. The user indicated should be the GoldenGate user account, not the target table schema owner. The following example creates a checkpoint table named *gg\_checkpoint*.

```
add checkpointtable <user>.gg_checkpoint
```

4. To enable the REPLICAT utility, use the following command.

```
add replicat <replicat name> EXTTRAIL <extract trail file> CHECKPOINTTABLE
<user>.gg_checkpoint
```

5. To start the REPLICAT utility, use the following command.

```
start <replicat name>
```

## Troubleshooting issues when using GoldenGate with Amazon RDS

This section explains the most common issues when using Oracle GoldenGate with Amazon RDS.

### Topics

- [Log retention \(p. 1247\)](#)
- [GoldenGate appears to be properly configured but replication is not working \(p. 1247\)](#)
- [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

### Log retention

To work with Oracle GoldenGate with Amazon RDS, make sure that you have log retention enabled.

Specify the duration for log retention in hours. The duration should exceed any potential downtime of the source instance, any potential period of communication, and any potential period of networking issues for the source instance. Such a duration lets Oracle GoldenGate recover logs from the source instance as needed.

The absolute minimum value required is one hour of logs retained. If you don't have log retention enabled, or if the retention value is too small, you receive the following message.

```
2014-03-06 06:17:27 ERROR OGG-00446 error 2 (No such file or directory)
opening redo log /rdsdbdata/db/GGTEST3_A/onlinelog/o1_mf_2_9k4bp1n6_.log
for sequence 1306Not able to establish initial position for begin time 2014-03-06
06:16:55.
```

### GoldenGate appears to be properly configured but replication is not working

For pre-existing tables, GoldenGate must be told which SCN it should work from. Take the following steps to fix this issue:

1. Launch the GoldenGate command line interface (*ggsci*). Log into the source database. The following example shows the format for logging.

```
dblogin userid <user>@<db tnsname>
```

2. Using the *ggsci* command line, set up the start SCN for the EXTRACT process. The following example sets the SCN to 223274 for the extract.

```
ALTER EXTRACT <extract process name> SCN 223274
start <extract process name>
```

3. Log in to the target database. The following example shows the format for logging in.

```
dblogin userid <user>@<db tnsname>
```

4. Using the ggsci command line, set up the start SCN for the REPLICAT process. The following example sets the SCN to 223274 for the REPLICAT.

```
start <replicat process name> atcsn 223274
```

## Integrated REPLICAT slow due to query on sys."\_DBA\_APPLY\_CDR\_INFO"

Oracle GoldenGate Conflict Detection and Resolution (CDR) provides basic conflict resolution routines. For example, CDR can resolve a unique conflict for an `INSERT` statement.

When CDR resolves a collision, it can insert records into the exception table `_DBA_APPLY_CDR_INFO` temporarily. Integrated REPLICAT deletes these records later. In a rare scenario, the integrated REPLICAT can process a large number of collisions, but a new integrated REPLICAT does not replace it. Instead of being removed, the existing rows in `_DBA_APPLY_CDR_INFO` are orphaned. Any new integrated REPLICAT processes slow down because they are querying orphaned rows in `_DBA_APPLY_CDR_INFO`.

To remove all rows from `_DBA_APPLY_CDR_INFO`, use the Amazon RDS procedure `rdsadmin_util.truncate_apply$_cdr_info`. This procedure is released as part of the October 2020 release and patch update. The procedure is available in the following database versions:

- [Version 19.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1289\)](#)
- [Version 18.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1327\)](#)
- [Version 12.2.0.1.ru-2020-10.rur-2020-10.r1 \(p. 1360\)](#)
- [Version 12.1.0.2.v22 \(p. 1401\)](#)

The following example truncates the table `_DBA_APPLY_CDR_INFO`.

```
SET SERVEROUTPUT ON SIZE 2000
EXEC rdsadmin.rdsadmin_util.truncate_apply$_cdr_info;
```

# Using the Oracle Repository Creation Utility on Amazon RDS for Oracle

You can use Amazon RDS to host an Oracle DB instance that holds the schemas to support your Fusion Middleware components. Before you can use Fusion Middleware components, you must create and populate schemas for them in your database. You create and populate the schemas by using the Oracle Repository Creation Utility (RCU).

You can store the schemas for any Fusion Middleware components in your Amazon RDS DB instance. The following is a list of schemas that have been verified to install correctly:

- Analytics (ACTIVITIES)
- Audit Services (IAU)
- Audit Services Append (IAU\_APPEND)
- Audit Services Viewer (IAU\_VIEWER)
- Discussions (DISCUSSIONS)
- Metadata Services (MDS)
- Oracle Business Intelligence (BIPLATFORM)
- Oracle Platform Security Services (OPSS)
- Portal and Services (WEBCENTER)
- Portlet Producers (PORTLET)
- Service Table (STB)
- SOA Infrastructure (SOAINFRA)
- User Messaging Service (UCSUMS)
- WebLogic Services (WLS)

## Licensing and versions

Amazon RDS supports Oracle Repository Creation Utility (RCU) version 12c only. You can use the RCU in the following configurations:

- RCU 12c with Oracle database 12.2.0.1
- RCU 12c with Oracle database 12.1.0.2.v4 or later

Before you can use RCU, you need a license for Oracle Fusion Middleware. You also need to follow the Oracle licensing guidelines for the Oracle database that hosts the repository. For more information, see [Oracle fusion middleware licensing information user manual](#) in the Oracle documentation.

Fusion MiddleWare supports repositories on Oracle Database Enterprise Edition and Standard Editions (SE, SE One, or SE Two). Oracle recommends Enterprise Edition for production installations that require partitioning and installations that require online index rebuild.

Before you create your Oracle DB instance, confirm the Oracle database version that you need to support the components that you want to deploy. You can use the Certification Matrix to find the requirements for the Fusion Middleware components and versions you want to deploy. For more information, see [Oracle fusion middleware supported system configurations](#) in the Oracle documentation.

Amazon RDS supports Oracle database version upgrades as needed. For more information, see [Upgrading a DB instance engine version \(p. 272\)](#).

## Before you begin

Before you begin, you need an Amazon VPC. Because your Amazon RDS DB instance needs to be available only to your Fusion Middleware components, and not to the public Internet, your Amazon RDS DB instance is hosted in a private subnet, providing greater security. For information about how to create an Amazon VPC for use with an Oracle DB instance, see [Creating a VPC for use with an Oracle database \(p. 1231\)](#).

Before you begin, you also need an Oracle DB instance. For information about how to create an Oracle DB instance for use with Fusion Middleware metadata, see [Creating an Oracle DB instance \(p. 1236\)](#).

## Recommendations

The following are some recommendations for working with your DB instance in this scenario:

- We recommend that you use Multi-AZ for production workloads. For more information about working with multiple Availability Zones, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).
- For additional security, Oracle recommends that you use Transparent Data Encryption (TDE) to encrypt your data at rest. If you have an Enterprise Edition license that includes the Advanced Security Option, you can enable encryption at rest by using the TDE option. For more information, see [Oracle Transparent Data Encryption \(p. 1216\)](#).

Amazon RDS also provides an encryption at rest option for all database editions. For more information, see [Encrypting Amazon RDS resources \(p. 1668\)](#).

- Configure your VPC Security Groups to allow communication between your application servers and your Amazon RDS DB instance. The application servers that host the Fusion Middleware components can be on Amazon EC2 or on-premises.

## Using the Oracle Repository Creation Utility

You use the Oracle Repository Creation Utility (RCU) to create and populate the schemas to support your Fusion Middleware components.

### Running RCU using the command line in one step

If you don't need to edit any of your schemas before populating them, you can run RCU in a single step. Otherwise, see the following section for running RCU in multiple steps.

You can run the RCU in silent mode by using the command-line parameter `-silent`. When you run RCU in silent mode, you can avoid typing passwords on the command line by creating a text file containing the passwords. Create a text file with the password for `dbUser` on the first line, and the password for each component on subsequent lines. You specify the name of the password file as the last parameter to the RCU command.

#### Example

The following example creates and populates schemas for the SOA Infrastructure component (and its dependencies) in a single step.

For Linux, macOS, or Unix:

```
export ORACLE_HOME=/u01/app/oracle/product/12.2.1.0/fmw
export JAVA_HOME=/usr/java/jdk1.8.0_65
${ORACLE_HOME}/oracle_common/bin/rcu \
-silent \
-createRepository \
-connectString ${dbhost}:${dbport}:${dbname} \
```

```
-dbUser ${dbuser} \
-dbRole Normal \
-honorOMF \
-schemaPrefix ${SCHEMA_PREFIX} \
-component MDS \
-component STB \
-component OPSS \
-component IAU \
-component IAU_APPEND \
-component IAU_VIEWER \
-component UCSUMS \
-component WLS \
-component SOAINFRA \
-f < /tmp/passwordfile.txt
```

For more information, see [Running Repository Creation Utility from the command line](#) in the Oracle documentation.

## Running RCU using the command line in multiple steps

If you need to manually edit your schema scripts, you can run the RCU in multiple steps:

1. Run RCU in **Prepare Scripts for System Load** mode by using the `-generateScript` command-line parameter to create the scripts for your schemas.
2. Manually edit and run the generated script `script_systemLoad.sql`.
3. Run RCU again in **Perform Product Load** mode by using the `-dataLoad` command-line parameter to populate the schemas.
4. Run the generated clean-up script `script_postDataLoad.sql`.

You can run the RCU in silent mode by using the command-line parameter `-silent`. When you run RCU in silent mode, you can avoid typing passwords on the command line by creating a text file containing the passwords. Create a text file with the password for `dbUser` on the first line, and the password for each component on subsequent lines. You specify the name of the password file as the last parameter to the RCU command.

### Example

The following example creates schema scripts for the SOA Infrastructure component (and its dependencies).

For Linux, macOS, or Unix:

```
export ORACLE_HOME=/u01/app/oracle/product/12.2.1.0/fmw
export JAVA_HOME=/usr/java/jdk1.8.0_65
${ORACLE_HOME}/oracle_common/bin/rcu \
-silent \
-generateScript \
-connectString ${dbhost}:${dbport}:${dbname} \
-dbUser ${dbuser} \
-dbRole Normal \
-honorOMF \
[-encryptTablespace true] \
-schemaPrefix ${SCHEMA_PREFIX} \
-component MDS \
-component STB \
-component OPSS \
-component IAU \
-component IAU_APPEND \
-component IAU_VIEWER \
-component UCSUMS \
```

```
-component WLS \
-component SOAINFRA \
-scriptLocation /tmp/rcuscripts \
-f < /tmp/passwordfile.txt
```

Now you can edit the generated script, connect to your Oracle DB instance, and run the script. The generated script is named `script_systemLoad.sql`. For information about connecting to your Oracle DB instance, see [Connecting to your sample Oracle DB instance \(p. 96\)](#).

The following example populates the schemas for the SOA Infrastructure component (and its dependencies).

For Linux, macOS, or Unix:

```
export JAVA_HOME=/usr/java/jdk1.8.0_65
${ORACLE_HOME}/oracle_common/bin/rcu \
-silent \
-dataLoad \
-connectString ${dbhost}:${dbport}:${dbname} \
-dbUser ${dbuser} \
-dbRole Normal \
-honorOMF \
-schemaPrefix ${SCHEMA_PREFIX} \
-component MDS \
-component STB \
-component OPSS \
-component IAU \
-component IAU_APPEND \
-component IAU_VIEWER \
-component UCSUMS \
-component WLS \
-component SOAINFRA \
-f < /tmp/passwordfile.txt
```

To finish, you connect to your Oracle DB instance, and run the clean-up script. The script is named `script_postDataLoad.sql`.

For more information, see [Running Repository Creation Utility from the command line](#) in the Oracle documentation.

## Running RCU in interactive mode

To use the RCU graphical user interface, you can run RCU in interactive mode. To run RCU in interactive mode, include the `-interactive` parameter and omit the `-silent` parameter. For more information, see [Understanding Repository Creation Utility screens](#) in the Oracle documentation.

### Example

The following example starts RCU in interactive mode and pre-populates the connection information.

For Linux, macOS, or Unix:

```
export ORACLE_HOME=/u01/app/oracle/product/12.2.1.0/fmw
export JAVA_HOME=/usr/java/jdk1.8.0_65
${ORACLE_HOME}/oracle_common/bin/rcu \
-interactive \
-createRepository \
-connectString ${dbhost}:${dbport}:${dbname} \
-dbUser ${dbuser} \
-dbRole Normal
```

## Known issues

The following are some known issues for working with RCU, with some troubleshooting suggestions:

- Oracle Managed Files (OMF) — Amazon RDS uses OMF data files to simplify storage management. You can customize tablespace attributes, such as size and extent management. However, specifying a data file name when you run RCU causes tablespace code to fail with ORA-20900. The RCU can be used with OMF in the following ways:
  - In RCU 12.2.1.0 and later, use the `-honorOMF` command-line parameter.
  - In RCU 12.1.0.3 and later, use multiple steps and edit the generated script. For more information, see [Running RCU using the command line in multiple steps \(p. 1251\)](#).
- SYSDBA — Because Amazon RDS is a managed service, you don't have full SYSDBA access to your Oracle DB instance. However, RCU 12c supports users with lower privileges. In most cases, the master user privilege is sufficient to create repositories. In some cases, the RCU might fail with ORA-01031 when attempting to grant SYS object privileges. You can retry and run the `RDSADMIN_UTIL.GRANT_SYS_OBJECT()` stored procedure, or contact AWS Support.
- Dropping Enterprise Scheduler Service — When you use the RCU to drop an Enterprise Scheduler Service repository, the RCU might fail with `Error: Component drop check failed`.

## Related topics

- [Oracle licensing options \(p. 1000\)](#)

# Installing a Siebel database on Oracle on Amazon RDS

You can use Amazon RDS to host a Siebel Database on an Oracle DB instance. The Siebel Database is part of the Siebel Customer Relationship Management (CRM) application architecture. For an illustration, see [Generic architecture of Siebel business application](#).

Use the following topic to help set up a Siebel Database on an Oracle DB instance on Amazon RDS. You can also find out how to use Amazon Web Services to support the other components required by the Siebel CRM application architecture.

## **Note**

To install a Siebel Database on Oracle on Amazon RDS, you need to use the master user account. You don't need SYSDBA privilege; master user privilege is sufficient. For more information, see [Master user account privileges \(p. 1750\)](#).

## Licensing and versions

To install a Siebel Database on Amazon RDS, you must use your own Oracle Database license, and your own Siebel license. You must have the appropriate Oracle Database license (with Software Update License and Support) for the DB instance class and Oracle Database edition. For more information, see [Oracle licensing options \(p. 1000\)](#).

Oracle Database Enterprise Edition is the only edition certified by Siebel for this scenario. Amazon RDS supports Siebel CRM version 15.0 or 16.0. Use Oracle Database 12c Release 1 (12.1.0.2.0). For the procedures following, we use Siebel CRM version 15.0 and Oracle Database Release 1 (12.1.0.2) or Oracle Database Release 2 (12.2.0.1). For more information, see [Oracle Database 12c with Amazon RDS \(p. 991\)](#).

Amazon RDS supports database version upgrades. For more information, see [Upgrading a DB instance engine version \(p. 272\)](#).

## Before you begin

Before you begin, you need an Amazon VPC. Because your Amazon RDS DB instance needs to be available only to your Siebel Enterprise Server, and not to the public Internet, your Amazon RDS DB instance is hosted in a private subnet, providing greater security. For information about how to create an Amazon VPC for use with Siebel CRM, see [Creating a VPC for use with an Oracle database \(p. 1231\)](#).

Before you begin, you also need an Oracle DB instance. For information about how to create an Oracle DB instance for use with Siebel CRM, see [Creating an Oracle DB instance \(p. 1236\)](#).

## Installing and configuring a Siebel database

After you create your Oracle DB instance, you can install your Siebel Database. You install the database by creating table owner and administrator accounts, installing stored procedures and functions, and then running the Siebel Database Configuration Wizard. For more information, see [Installing the Siebel database on the RDBMS](#).

To run the Siebel Database Configuration Wizard, you need to use the master user account. You don't need SYSDBA privilege; master user privilege is sufficient. For more information, see [Master user account privileges \(p. 1750\)](#).

## Using other Amazon RDS features with a Siebel database

After you create your Oracle DB instance, you can use additional Amazon RDS features to help you customize your Siebel Database.

## Collecting statistics with the Oracle Statspack option

You can add features to your DB instance through the use of options in DB option groups. When you created your Oracle DB instance, you used the default DB option group. If you want to add features to your database, you can create a new option group for your DB instance.

If you want to collect performance statistics on your Siebel Database, you can add the Oracle Statspack feature. For more information, see [Oracle Statspack \(p. 1210\)](#).

Some option changes are applied immediately, and some option changes are applied during the next maintenance window for the DB instance. For more information, see [Working with option groups \(p. 213\)](#). After you create a customized option group, modify your DB instance to attach it. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Performance tuning with parameters

You manage your DB engine configuration through the use of parameters in a DB parameter group. When you created your Oracle DB instance, you used the default DB parameter group. If you want to customize your database configuration, you can create a new parameter group for your DB instance.

When you change a parameter, depending on the type of the parameter, the changes are applied either immediately or after you manually reboot the DB instance. For more information, see [Working with DB parameter groups \(p. 229\)](#). After you create a customized parameter group, modify your DB instance to attach it. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

To optimize your Oracle DB instance for Siebel CRM, you can customize certain parameters. The following table shows some recommended parameter settings. For more information about performance tuning Siebel CRM, see [Siebel CRM Performance Tuning Guide](#).

Parameter name	Default value	Guidance for optimal Siebel CRM performance
<code>_always_semi_join</code>	<code>CHOOSE</code>	OFF
<code>_b_tree_bitmap_p</code>	<code>TRUE</code>	FALSE
<code>_like_with_bind_</code>	<code>EQUALITY</code>	TRUE
<code>_no_or_expansion</code>	<code>FALSE</code>	FALSE
<code>_optimizer_join_</code>	<code>TRUE</code>	<code>sanity_check</code> TRUE
<code>_optimizer_max_parallelizations</code>	<code>2000</code>	100
<code>_optimizer_sortmerge_join_enabled</code>	<code>TRUE</code>	FALSE
<code>_partition_view_enabled</code>	<code>TRUE</code>	FALSE
<code>open_cursors</code>	300	At least <b>2000</b> .

## Creating snapshots

After you create your Siebel Database, you can copy the database by using the snapshot features of Amazon RDS. For more information, see [Creating a DB snapshot \(p. 349\)](#) and [Restoring from a DB snapshot \(p. 352\)](#).

## Support for other Siebel CRM components

In addition to your Siebel Database, you can also use Amazon Web Services to support the other components of your Siebel CRM application architecture. You can find more information about the support provided by Amazon AWS for additional Siebel CRM components in the following table.

Siebel CRM component	Amazon AWS Support
Siebel Enterprise  (with one or more Siebel Servers)	<p>You can host your Siebel Servers on Amazon Elastic Compute Cloud (Amazon EC2) instances. You can use Amazon EC2 to launch as many or as few virtual servers as you need. Using Amazon EC2, you can scale up or down easily to handle changes in requirements. For more information, see <a href="#">What is Amazon EC2?</a></p> <p>You can put your servers in the same VPC with your DB instance and use the VPC security group to access the database. For more information, see <a href="#">Working with a DB instance in a VPC (p. 1765)</a>.</p>
Web Servers  (with Siebel Web Server Extensions)	<p>You can install multiple Web Servers on multiple EC2 instances. You can then use Elastic Load Balancing to distribute incoming traffic among the instances. For more information, see <a href="#">What is Elastic Load Balancing?</a></p>
Siebel Gateway Name Server	<p>You can host your Siebel Gateway Name Server on an EC2 instance. You can then put your server in the same VPC with the DB instance and use the VPC security group to access the database. For more information, see <a href="#">Working with a DB instance in a VPC (p. 1765)</a>.</p>

# Oracle database engine release notes

Updates to your Amazon RDS for Oracle DB instances keep them current. If you apply updates, you can be confident that your DB instance is running a version of the database software that has been tested by both Oracle and Amazon. We don't support applying one-off patches to individual DB instances.

You can specify any currently supported Oracle Database version when creating a new DB instance. You can specify the major version, such as Oracle Database 12c Release 1 (12.1), and any supported minor version for the specified major version. If no version is specified, Amazon RDS defaults to a supported version, typically the most recent version. If a major version is specified but a minor version is not, Amazon RDS defaults to a recent release of the major version that you have specified. To see a list of supported versions and defaults for newly created DB instances, use the [describe-db-engine-versions](#) AWS CLI command.

Oracle Database 19c (19.0.0), Oracle Database 18c (18.0.0), and Oracle Database 12c Release 2 (12.2.0.1)

For Amazon RDS for Oracle Database 19c (19.0.0.0), Oracle Database 18c (18.0.0.0), and Oracle Database 12c Release 2 (12.2.0.1), Amazon RDS incorporates bug fixes from Oracle by using Release Updates (RUs) and Release Updates Revisions (RURs). We don't support applying one-off patches to individual DB instances.

To find what RUs and RURs are applied to Amazon RDS for Oracle Database 19c (19.0.0), Oracle Database 18c (18.0.0.0), and Oracle Database 12c Release 2 (12.2.0.1), see the following table.

## Oracle versions 12.1.0.2 and 11.2.0.4

For Amazon RDS for Oracle Database 12c Release 1 (12.1.0.2) and Oracle Database 11g Release 2 (11.2.0.4), Amazon RDS incorporates bug fixes from Oracle by using their quarterly Database Patch Set Updates (PSUs). If you apply updates, you can be confident that your DB instance is running a version of the database software that has been tested by both Oracle and Amazon. We don't support applying one-off patches to individual DB instances.

### Note

RDS for Oracle Database 11g is deprecated. The 11.2.0.4 information in this section is only relevant when you want to upgrade an 11g snapshot.

To find what Oracle Patch Set Updates (PSUs) are applied to Amazon RDS for Oracle Database 12c Release 1 (12.1.0.2) and Oracle Database 11g Release 2 (11.2.0.4), see the following table.

PSU	Oracle Database 12c Release 1 (12.1.0.2)	Oracle Database 11g (11.2.0.4)
2021 April	<a href="#">12.1.0.2.v24 (p. 1393)</a>	N/A
2021 January	<a href="#">12.1.0.2.v23 (p. 1397)</a>	N/A
2020 October	<a href="#">12.1.0.2.v22 (p. 1401)</a>	<a href="#">11.2.0.4.v26 (p. 1449)</a>
2020 July	<a href="#">12.1.0.2.v21 (p. 1405)</a>	<a href="#">11.2.0.4.v25 (p. 1452)</a>
2020 April	<a href="#">12.1.0.2.v20 (p. 1409)</a>	<a href="#">11.2.0.4.v24 (p. 1455)</a>
2020 January	<a href="#">12.1.0.2.v19 (p. 1413)</a>	<a href="#">11.2.0.4.v23 (p. 1457)</a>
2019 October	<a href="#">12.1.0.2.v18 (p. 1416)</a>	<a href="#">11.2.0.4.v22 (p. 1460)</a>
2019 July	<a href="#">12.1.0.2.v17 (p. 1419)</a>	<a href="#">11.2.0.4.v21 (p. 1462)</a>
2019 April	<a href="#">12.1.0.2.v16 (p. 1422)</a>	<a href="#">11.2.0.4.v20 (p. 1464)</a>
2019 January	<a href="#">12.1.0.2.v15 (p. 1425)</a>	<a href="#">11.2.0.4.v19 (p. 1466)</a>
2018 October	<a href="#">12.1.0.2.v14 (p. 1427)</a>	<a href="#">11.2.0.4.v18 (p. 1468)</a>
2018 July	<a href="#">12.1.0.2.v13 (p. 1429)</a>	<a href="#">11.2.0.4.v17 (p. 1469)</a>
2018 April	<a href="#">12.1.0.2.v12 (p. 1432)</a>	<a href="#">11.2.0.4.v16 (p. 1471)</a>
2018 January	<a href="#">12.1.0.2.v11 (p. 1434)</a>	<a href="#">11.2.0.4.v15 (p. 1473)</a>
2017 October	<a href="#">12.1.0.2.v10 (p. 1436)</a>	<a href="#">11.2.0.4.v14 (p. 1474)</a>
2017 July	<a href="#">12.1.0.2.v9 (p. 1437)</a>	<a href="#">11.2.0.4.v13 (p. 1476)</a>

## Database engine: 19.0.0.0

The following versions are available for Oracle database engine 19.0.0.0:

- [Version 19.0.0.0.ru-2021-04.rur-2021-04.r1 \(p. 1259\)](#)
- [Version 19.0.0.0.ru-2021-01.rur-2021-01.r2 \(p. 1271\)](#)
- [Version 19.0.0.0.ru-2021-01.rur-2021-01.r1 \(p. 1280\)](#)
- [Version 19.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1289\)](#)
- [Version 19.0.0.0.ru-2020-07.rur-2020-07.r1 \(p. 1296\)](#)
- [Version 19.0.0.0.ru-2020-04.rur-2020-04.r1 \(p. 1302\)](#)
- [Version 19.0.0.0.ru-2020-01.rur-2020-01.r1 \(p. 1307\)](#)
- [Version 19.0.0.0.ru-2019-10.rur-2019-10.r1 \(p. 1311\)](#)
- [Version 19.0.0.0.ru-2019-07.rur-2019-07.r1 \(p. 1314\)](#)

### Version 19.0.0.0.ru-2021-04.rur-2021-04.r1

Version 19.0.0.0.ru-2021-04.rur-2021-04.r1 includes the following:

- Patch 32545013: DATABASE RELEASE UPDATE 19.11.0.0.0
- Patch 32399816: OJVM RELEASE UPDATE 19.11.0.0.0
- Patch 32327201: RDBMS - DSTV36 UPDATE - TZDATA2020E
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER TABLE
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- PreUpgrade Jar: preupgrade\_19\_cbuild\_10\_lf.zip

#### Combined Patches for Version 19.0.0.0.ru-2021-04.rur-2021-04.r1, Released April 2021

Bugs fixed:

## Version 19.0.0.0.ru-2021-01.rur-2021-01.r2

### Important

We recommend that you upgrade your DB instance to this version rather than to 19.0.0.0.ru-2021-01.rur-2021-01.r1. The application of the patch for minor engine upgrades to 19.0.0.0.ru-2021-01.rur-2021-01.r1 encountered an issue. Release update 19.10.0.0.210119 (32218454) didn't register correctly in the DBA\_REGISTRY\_SQLPATCH table.

Version 19.0.0.0.ru-2021-01.rur-2021-01.r2 includes the following:

- Patch 32218454: DATABASE RELEASE UPDATE 19.10.0.0.210119
- Patch 32067171: OJVM RELEASE UPDATE 19.10.0.0.210119
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER TABLE
- Patch 29782284: ORA-06508:"MDSYS.MDPRVT\_IDX" WHILE UPGRADING DATABASE TO 18.3
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition
- PreUpgrade Jar: preupgrade\_19\_cbuild\_9\_lf.zip
- Support for [Managing advisor tasks \(p. 1111\)](#) using procedures in the rdsadmin.rdsadmin\_util package

## Combined patches for version 19.0.0.0.ru-2021-01.rur-2021-01.r2, Released January 2021

## Version 19.0.0.0.ru-2021-01.rur-2021-01.r1

### Important

We recommend that you upgrade your DB instance to 19.0.0.0.ru-2021-01.rur-2021-01.r2 rather than to 19.0.0.0.ru-2021-01.rur-2021-01.r1. The application of the patch for minor engine upgrades to 19.0.0.0.ru-2021-01.rur-2021-01.r1 encountered an issue. Release update 19.10.0.0.210119 (32218454) didn't register correctly in the DBA\_REGISTRY\_SQLPATCH table.

Version 19.0.0.0.ru-2021-01.rur-2021-01.r1 includes the following:

- Patch 32218454: DATABASE RELEASE UPDATE 19.10.0.0.210119
- Patch 32067171: OJVM RELEASE UPDATE 19.10.0.0.210119
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER TABLE
- Patch 29782284: ORA-06508:"MDSYS.MDPRVT\_IDX" WHILE UPGRADING DATABASE TO 18.3
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition
- PreUpgrade Jar: preupgrade\_19\_cbuild\_9\_1f.zip
- Support for [Managing advisor tasks \(p. 1111\)](#) using procedures in the rdsadmin.rdsadmin\_util package

## Combined patches for version 19.0.0.0.ru-2021-01.rur-2021-01.r1, released January 2021

Bugs fixed:

## Version 19.0.0.0.ru-2020-10.rur-2020-10.r1

Version 19.0.0.0.ru-2020-10.rur-2020-10.r1 includes the following:

- Patch 31771877: Database Release Update: 19.9.0.0.201020 (31771877)
- Patch 31668882: OJVM RELEASE UPDATE: 19.9.0.0.201020 (31668882)
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition.
- PreUpgrade Jar: preupgrade\_19\_cbuild\_8\_lf.zip
- Support for [Setting and unsetting system diagnostic events \(p. 1058\)](#) using procedures in the rdsadmin.rdsadmin\_util package
- Support for the procedure rdsadmin\_util.truncate\_apply\$\_cdr\_info described in [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

Combined patches for version 19.0.0.0.ru-2020-10.rur-2020-10.r1, released October 2020

Bugs fixed:

## Version 19.0.0.0.ru-2020-07.rur-2020-07.r1

Version 19.0.0.0.ru-2020-07.rur-2020-07.r1 includes the following:

- Patch 31281355: Database Release Update 19.8.0.0.200714
- Patch 31219897: Oracle JVM Release Update 19.8.0.0.200714
- Patch 31335037: DSTV35 for RDBMS (TZDATA2020A)
- Patch 31335142: DSTV35 for OJVM (TZDATA2020A)
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition
- PreUpgrade Jar: preupgrade\_19\_cbuild\_7\_1f.zip
- Patch 30417732: ORA-00600 [KQRHASHTABLEREMOVE: X LOCK] AND INSTANCE CRASH

Combined patches for version 19.0.0.0.ru-2020-07.rur-2020-07.r1, released July 2020

Bugs fixed:

7391838, 8476681, 14735102, 17428816, 19080742, 19697993, 20313356

## Version 19.0.0.0.ru-2020-04.rur-2020-04.r1

Version 19.0.0.0.ru-2020-04.rur-2020-04.r1 includes the following:

- Patch 30869156: Database Release Update 19.7.0.0.200414
- Patch 30805684: Oracle JVM Release Update 19.7.0.0.200414
- Patch 29997937: DSTv34 UPDATE for RDBMS (TZDATA2019B)
- Patch 29997959: DSTV34 UPDATE for OJVM (TZDATA2019B)
- PreUpgrade Jar: preupgrade\_19\_cbuild\_5\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 30528704: 19C RMAN RECOVER DATABASE USE REDO LOG INSTEAD OF ARCHIVELOG AFTER APPLYING OCT DATABASE RU
- Support for [Purging the recycle bin \(p. 1074\)](#)

- Support for [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#) using the `rdsadmin.rdsadmin_diagnostic_util` package

## Combined patches for version 19.0.0.0.ru-2020-04.rur-2020-04.r1, released April 2020

Bugs fixed:

## Version 19.0.0.0.ru-2020-01.rur-2020-01.r1

Version 19.0.0.0.ru-2020-01.rur-2020-01.r1 includes the following:

- Patch 30557433: Database Release Update: 19.6.0.0.200114
- Patch 30484981: OJVM RELEASE UPDATE: 19.6.0.0.200114
- Patch 29997937: DSTv34 UPDATE for RDBMS (TZDATA2019B)

- Patch 29997959: DSTV34 UPDATE for OJVM (TZDATA2019B)
- PreUpgrade Jar: preupgrade\_19\_cbuild\_5\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 30528704: 19C RMAN RECOVER DATABASE USE REDO LOG INSTEAD OF ARCHIVELOG AFTER APPLYING OCT DATABASE RU

## Oracle release update 19.6.0.0.200114, released January 2020

### Bugs fixed:

## Version 19.0.0.0.ru-2019-10.rur-2019-10.r1

Version 19.0.0.0.ru-2019-10.rur-2019-10.r1 includes the following:

- Patch 30125133: DATABASE RELEASE UPDATE 19.5.0.0.0
- Patch 30128191: OJVM RELEASE UPDATE 19.5.0.0.0
- Patch 29997937: DSTv34 UPDATE for RDBMS (TZDATA2019B)
- Patch 29997959: DSTV34 UPDATE for OJVM (TZDATA2019B)
- PreUpgrade Jar: preupgrade\_19\_cbuild\_4\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 30528704: 19C RMAN RECOVER DATABASE USE REDO LOG INSTEAD OF ARCHIVELOG AFTER APPLYING OCT DATABASE RU
- Support for [Resizing the temporary tablespace in a read replica \(p. 1073\)](#)

## Oracle release update 19.5.0.0.0, released October 2019

Bugs fixed:

## Version 19.0.0.0.ru-2019-07.rur-2019-07.r1

Version 19.0.0.0.ru-2019-07.rur-2019-07.r1 includes the following:

- Patch 29834717: Database Release Update: 19.4.0.0.190716
- Patch 29774421: OJVM RELEASE UPDATE: 19.4.0.0.190716
- Patch 28852325: RDBMS - DSTV33 UPDATE - TZDATA2018G
- Patch 28852334: DSTV33 UPDATE - TZDATA2018G - NEED OJVM FIX
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE

- PreUpgrade Jar: preupgrade\_19\_cbuild\_4\_lf.zip

## Oracle release update 19.4.0.0.190716, released July 2019

Bugs fixed:

## Database engine: 18.0.0.0

The following versions are available for Oracle database engine 18.0.0.0:

- [Version 18.0.0.0.ru-2021-04.rur-2021-04.r1 \(p. 1317\)](#)
- [Version 18.0.0.0.ru-2021-01.rur-2021-01.r1 \(p. 1322\)](#)
- [Version 18.0.0.0.ru-2020-10.rur-2020-10.r1 \(p. 1327\)](#)
- [Version 18.0.0.0.ru-2020-07.rur-2020-07.r1 \(p. 1331\)](#)
- [Version 18.0.0.0.ru-2020-04.rur-2020-04.r1 \(p. 1336\)](#)
- [Version 18.0.0.0.ru-2020-01.rur-2020-01.r1 \(p. 1340\)](#)
- [Version 18.0.0.0.ru-2019-10.rur-2019-10.r1 \(p. 1343\)](#)
- [Version 18.0.0.0.ru-2019-07.rur-2019-07.r1 \(p. 1346\)](#)

### Note

Oracle Database 18c, Version 18.0.0.0 is on a deprecation path. Oracle Corporation will no longer provide patches for 18c after the end-of-support date. For more information, see [Preparing for the automatic upgrade of Oracle Database 18c \(p. 1226\)](#).

## Version 18.0.0.0.ru-2021-04.rur-2021-04.r1

Version 18.0.0.0.ru-2021-04.rur-2021-04.r1 includes the following:

- Patch 32524155: DATABASE RELEASE UPDATE 18.14.0.0.0
- Patch 32552752: OJVM RELEASE UPDATE 18.14.0.0.0
- Patch 32327201: RDBMS - DSTV36 UPDATE - TZDATA2020E
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 27539475: ORA-3816 - MISSING MESSAGE INFORMATION FOR 3816 ERROR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER TABLE
- Patch 29374604: Golden Gate Integrated Extract not starting 18c/19c Standard Edition
- Patch 26352615: SPILLOVER AUDIT FILES CANNOT BE FOUND ORA-46372
- PreUpgrade Jar: preupgrade\_181\_cbuild\_10\_lf.zip

## Combined Patches for Version 18.0.0.0.ru-2021-04.rur-2021-04.r1, Released April 2021

Bugs fixed:

## Version 18.0.0.0.ru-2021-01.rur-2021-01.r1

Version 18.0.0.0.ru-2021-01.rur-2021-01.r1 includes the following:

- Patch 32204699: DATABASE RELEASE UPDATE 18.13.0.0.210119
- Patch 32119939: OJVM RELEASE UPDATE 18.13.0.0.210119
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 27539475: ORA-3816 - MISSING MESSAGE INFORMATION FOR 3816 ERROR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER TABLE
- Patch 29374604: Golden Gate Integrated Extract not starting 18c/19c Standard Edition
- Patch 29782284: ORA-06508:"MDSYS.MDPRVT\_IDX" WHILE UPGRADING DATABASE TO 18.3
- PreUpgrade Jar: preupgrade\_181\_cbuild\_10\_lf.zip
- Java Cryptography Extension (JCE): Unlimited Strength Jurisdiction Policy Files for JVM version 8
- Support for [Setting parameters for advisor tasks \(p. 1112\)](#) using procedures in the `rdsadmin.rdsadmin_util` package

## Combined patches for version 18.0.0.0.ru-2021-01.rur-2021-01.r1, released January 2021

Bugs fixed:

## Version 18.0.0.0.ru-2020-10.rur-2020-10.r1

Version 18.0.0.0.ru-2020-10.rur-2020-10.r1 includes the following:

- Patch 31730250: Database Release Update: 18.12.0.0.201020 (31730250)
- Patch 31668892: OJVM RELEASE UPDATE: 18.12.0.0.201020 (31668892)
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition.
- PreUpgrade Jar: preupgrade\_181\_cbuild\_10\_1f.zip
- Support for [Setting and unsetting system diagnostic events \(p. 1058\)](#) using procedures in the rdsadmin.rdsadmin\_util package
- Support for the procedure rdsadmin\_util.truncate\_apply\$\_cdr\_info described in [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

## Combined patches for version 18.0.0.0.ru-2020-10.rur-2020-10.r1, released October 2020

Bugs fixed:

## Version 18.0.0.0.ru-2020-07.rur-2020-07.r1

Version 18.0.0.0.ru-2020-07.rur-2020-07.r1 includes the following:

- Patch 31308624: Database Release Update 18.11.0.0.200714
- Patch 31219909: OJVM RELEASE UPDATE: 18.11.0.0.200714

- Patch 31335037: DSTV35 for RDBMS (TZDATA2020A)
- Patch 31335142: DSTV35 for OJVM (TZDATA2020A)
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 29374604: IE not starting against 18c Oracle RDBMS Standard Edition
- PreUpgrade Jar: preupgrade\_181\_cbuild\_10\_lf.zip

## Combined patches for version 18.0.0.0.ru-2020-07.rur-2020-07.r1, released July 2020

Bugs fixed:

## Version 18.0.0.0.ru-2020-04.rur-2020-04.r1

Version 18.0.0.0.ru-2020-04.rur-2020-04.r1 includes the following:

- Patch 30872794: Database Release Update 18.10.0.0.200414
- Patch 30805598: Oracle JVM Release Update 18.10.0.0.200414
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019B)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_181\_cbuild\_9\_1f.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Support for [Purging the recycle bin \(p. 1074\)](#)
- Support for [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#) using the `rdsadmin.rdsadmin_diagnostic_util` package

## Combined patches for version 18.0.0.0.ru-2020-04.rur-2020-04.r1, released April 2020

Bugs fixed:

## Version 18.0.0.0.ru-2020-01.rur-2020-01.r1

Version 18.0.0.0.ru-2020-01.rur-2020-01.r1 includes the following:

- Patch 30480385: Database Release Update: 18.9.0.0.200114
- Patch 30501926: OJVM RELEASE UPDATE: 18.9.0.0.200114
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019B)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_181\_cbuild\_9\_1f.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE

## Oracle release update 18.9.0.0.200114, released January 2020

Bugs fixed:

## Version 18.0.0.0.ru-2019-10.rur-2019-10.r1

Version 18.0.0.0.ru-2019-10.rur-2019-10.r1 includes the following:

- Patch 30112122: DATABASE OCT 2019 RELEASE UPDATE 18.8.0.0.191015
- Patch 30133625: OJVM RELEASE UPDATE 12.2.0.1.191015
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_181\_cbuild\_8\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Support for [Resizing the temporary tablespace in a read replica \(p. 1073\)](#)

## Oracle release update 18.8.0.0.0, released October 2019

Bugs fixed:

## Version 18.0.0.0.ru-2019-07.rur-2019-07.r1

Version 18.0.0.0.ru-2019-07.rur-2019-07.r1 includes the following:

- Patch 29757256: Database Release Update: 18.7.0.0.190716
- Patch 29774410: OJVM RELEASE UPDATE: 18.7.0.0.190716
- Patch 27539475: "ORA-3816 - MISSING MESSAGE INFORMATION FOR 3816 ERROR."
- Patch 29213893: "DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER\$ TABLE"
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- PreUpgrade Jar: preupgrade\_181\_cbuild\_7\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle release update 18.7.0.0.190716, released July 2019

Bugs fixed:

## Database engine: 12.2.0.1

For Oracle Database 12c Release 2 (12.2.0.1), Oracle changed the way it releases Oracle Database updates. Instead of Patch Set Updates (PSUs), Oracle supplies Release Updates (RUs) and Release Updates Revisions (RURs). RUs contain optimizer changes, feature additions, and security fixes. RURs only contain security fixes for the two preceding quarterly patch cycles. With this new system, you have more control over the features that you install with each update.

The naming conventions have also changed for Oracle Database 12c version Release 2 (12.2.0.1) versions. In previous versions, Amazon RDS for Oracle used the PSU naming convention of *oracle-version.vpatch-version*. The *patch-version* corresponded with an Oracle PSU. For example, in Oracle for Amazon RDS version 12.1.0.2.v13, the v13 part of the version number corresponds with an Oracle PSU.

Oracle Database 12c Release 2 (12.2.0.1) naming conventions account for both RU and RUR updates. For example, the first Amazon RDS for Oracle version available is 12.2.0.1.ru-2018-10.rur-2018-10.r1. In this example, 12.2 is the major version, and 0.1 is the minor version. The revision version has the following parts:

- ru-2018-10 – the October RU
- rur-2018-10 – the October RUR for the October RU
- r1 – Internal Amazon RDS revision, which lets Amazon RDS differentiate between emergency patches of pre-existing RU/RURs

For more information about the new Oracle Database versioning system, see the posts [Differences between PSU / BP and RU / RUR at the Upgrade your Database – NOW! blog](#) and [RU and RUR patches for Oracle Database 12c Release 2 \(12.2\)](#) at the Oracle–Help blog.

The following versions are available for Oracle database engine 12.2.0.1:

- [Version 12.2.0.1.ru-2021-04.rur-2021-04.r1 \(p. 1349\)](#)
- [Version 12.2.0.1.ru-2021-01.rur-2021-01.r1 \(p. 1354\)](#)
- [Version 12.2.0.1.ru-2020-10.rur-2020-10.r1 \(p. 1360\)](#)
- [Version 12.2.0.1.ru-2020-07.rur-2020-07.r1 \(p. 1365\)](#)
- [Version 12.2.0.1.ru-2020-04.rur-2020-04.r1 \(p. 1369\)](#)
- [Version 12.2.0.1.ru-2020-01.rur-2020-01.r1 \(p. 1374\)](#)
- [Version 12.2.0.1.ru-2019-10.rur-2019-10.r1 \(p. 1378\)](#)
- [Version 12.2.0.1.ru-2019-07.rur-2019-07.r1 \(p. 1381\)](#)
- [Version 12.2.0.1.ru-2019-04.rur-2019-04.r1 \(p. 1384\)](#)
- [Version 12.2.0.1.ru-2019-01.rur-2019-01.r1 \(p. 1387\)](#)
- [Version 12.2.0.1.ru-2018-10.rur-2018-10.r1 \(p. 1390\)](#)

## Version 12.2.0.1.ru-2021-04.rur-2021-04.r1

Version 12.2.0.1.ru-2021-04.rur-2021-04.r1 includes the following:

- Patch 32507738: DATABASE APR 2021 RELEASE UPDATE 12.2.0.1.210420
- Patch 32473172: OJVM RELEASE UPDATE 12.2.0.1.210420
- Patch 32327201: RDBMS - DSTV36 UPDATE - TZDATA2020E

- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 26352615: SPILLOVER AUDIT FILES CANNOT BE FOUND ORA-46372
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_24\_lf.zip

## Combined Patches for Version 12.2.0.1.ru-2021-04.rur-2021-04.r1, Released April 2021

Bugs fixed:

## Version 12.2.0.1.ru-2021-01.rur-2021-01.r1

Version 12.2.0.1.ru-2021-01.rur-2021-01.r1 includes the following:

- Patch 32228578: DATABASE JAN 2021 RELEASE UPDATE 12.2.0.1.210119
- Patch 32119931: OJVM RELEASE UPDATE 12.2.0.1.210119
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_1f.zip
- Java Cryptography Extension (JCE): Unlimited Strength Jurisdiction Policy Files for JVM version 8
- Support for [Managing advisor tasks \(p. 1111\)](#) using procedures in the `rdsadmin.rdsadmin_util` package

## Combined patches for version 12.2.0.1.ru-2021-01.rur-2021-01.r1, released January 2021

Bugs fixed:

## Version 12.2.0.1.ru-2020-10.rur-2020-10.r1

Version 12.2.0.1.ru-2020-10.rur-2020-10.r1 includes the following:

- Patch 31741641: Database Oct 2020 Release Update : 12.2.0.1.201020 (31741641)
- Patch 31668898: OJVM RELEASE UPDATE 12.2.0.1.201020 (31668898)
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_lf.zip
- Support for [Setting and unsetting system diagnostic events \(p. 1058\)](#) using procedures in the `rdsadmin.rdsadmin_util` package
- Support for the procedure `rdsadmin_util.truncate_apply$_cdr_info` described in [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

**Combined patches for version 12.2.0.1.ru-2020-10.rur-2020-10.r1, released October 2020**

Bugs fixed:

## Version 12.2.0.1.ru-2020-07.rur-2020-07.r1

Version 12.2.0.1.ru-2020-07.rur-2020-07.r1 includes the following:

- Patch 31312468: Database Jul 2020 Release Update 12.2.0.1.200714
- Patch 31219919: OJVM RELEASE UPDATE: 12.2.0.1.200714
- Patch 31335037: DSTV35 for RDBMS (TZDATA2020A)
- Patch 31335142: DSTV35 for OJVM (TZDATA2020A)
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_if.zip

**Combined patches for version 12.2.0.1.ru-2020-07.rur-2020-07.r1, released July 2020**

Bugs fixed:

## Version 12.2.0.1.ru-2020-04.rur-2020-04.r1

Version 12.2.0.1.ru-2020-04.rur-2020-04.r1 includes the following:

- Patch 30886680: Database Apr 2020 Release Update 12.2.0.1.200414
- Patch 30805580: Oracle JVM Release Update 12.2.0.1.200414
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470
- Support for [Purging the recycle bin \(p. 1074\)](#)

- Support for [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#) using the `rdsadmin.rdsadmin_diagnostic_util` package

## Combined patches for version 12.2.0.1.ru-2020-04.rur-2020-04.r1, released April 2020

Bugs fixed:

## Version 12.2.0.1.ru-2020-01.rur-2020-01.r1

Version 12.2.0.1.ru-2020-01.rur-2020-01.r1 includes the following:

- Patch 30593149: Database Jan 2020 Release Update: 12.2.0.1.200114
- Patch 30502018: OJVM RELEASE UPDATE 12.2.0.1.200114
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_if.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470

### Oracle release update 12.2.0.1.200114, released January 2020

Bugs fixed:

## Version 12.2.0.1.ru-2019-10.rur-2019-10.r1

Version 12.2.0.1.ru-2019-10.rur-2019-10.r1 includes the following:

- Patch 30138470: DATABASE OCT 2019 RELEASE UPDATE 12.2.0.1.191015
- Patch 30133625: OJVM RELEASE UPDATE 12.2.0.1.191015
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_23\_lf.zip
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR is included in DB PATCH 30138470
- Support for [Resizing the temporary tablespace in a read replica \(p. 1073\)](#)

### Oracle release update 12.2.0.1.191015, released October 2019

Bugs fixed:

Version 12.2.0.1.ru-2019-07.rur-2019-07.r1 includes the following:

- Patch 29757449: DATABASE JUL 2019 RELEASE UPDATE 12.2.0.1.190716
- Patch 29774415: OJVM RELEASE UPDATE 12.2.0.1.190716
- Patch 28125601: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28127287: DSTv33 for OJVM (TZDATA2018G)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_22\_lf.zip
- Patch 29213893: DBMS\_STATS FAILING WITH ERROR ORA-01422 WHEN GATHERING STATS FOR USER \$ TABLE
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

Oracle release update 12.2.0.1.190716, released July 2019

Bugs fixed:

## Version 12.2.0.1.ru-2019-04.rur-2019-04.r1

Version 12.2.0.1.ru-2019-04.rur-2019-04.r1 includes the following:

- Patch 29314339: Database Apr 2019 Release Update: 12.2.0.1.190416
- Patch 29249637: OJVM RELEASE UPDATE: 12.2.0.1.190416

- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_21\_lf.zip
- Patch 28423598: GOLDENGATE AUTH CAUSES ACTIVE DG TO BE UNUSABLE UNTIL BOUNCE
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Support for the package `rdsadmin_dbms_goldengate_auth`, which provides GRANT privileges needed by a GoldenGate administrator account (see [Grant account privileges on the source DB \(p. 1242\)](#))

## Oracle release update 12.2.0.1.190416, released April 2019

Bugs fixed:

## Version 12.2.0.1.ru-2019-01.rur-2019-01.r1

Version 12.2.0.1.ru-2019-01.rur-2019-01.r1 includes the following:

- Patch 28822515: Database Jan 2019 Release Update: 12.2.0.1.190115
- Patch 28790651: OJVM RELEASE UPDATE: 12.2.0.1.190115
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 28127287: DSTv32 for OJVM (TZDATA2018E)
- PreUpgrade Jar: preupgrade\_12201\_cbuild\_19\_lf.zip

## Oracle release update 12.2.0.1.190115, released January 2019

Bugs fixed:

## Version 12.2.0.1.ru-2018-10.rur-2018-10.r1

Version 12.2.0.1.ru-2018-10.rur-2018-10.r1 includes the following:

- October 2018 Release Update: 12.2.0.1.181016 (28662603)

## Oracle release update 12.2.0.1.181016, released October 2018

Bugs fixed:

## Version 12.1.0.2.v24

Version 12.1.0.2.v24 includes the following:

- Patch 32328635: DATABASE PATCH SET UPDATE 12.1.0.2.210420
- Patch 32473164: OJVM PATCH SET UPDATE 12.1.0.2.210420
- Patch 32327201: RDBMS - DSTV36 UPDATE - TZDATA2020E
- Patch 17969866: Oracle GoldenGate – 46719 ENH REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES
- Patch 20394750: Oracle GoldenGate – APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS
- Patch 24835919: Oracle GoldenGate – IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- Patch 21171382: ADD CONTROL FOR AUTOMATIC CREATION OF STATS EXTENSIONS
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 25031502: MV QUERY REWRITE WORKLOAD HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 23711335: CDB\_UPG PDCDB CDB UPGRADE AS WHOLE TAKES 1 MORE HOUR THAN PREVIOUS LABELS IN MAY
- Patch 32616600: JSON Bundle Patch

- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zip

## Combined Patches for Version 12.1.0.2.v24, Released April 2021

Bugs fixed:

## Version 12.1.0.2.v23

Version 12.1.0.2.v23 includes the following:

- Patch 31985579: DATABASE PATCH SET UPDATE 12.1.0.2.210119
- Patch 32119956: OJVM PATCH SET UPDATE 12.1.0.2.210119
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 17969866: Oracle GoldenGate – 46719 ENH REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES
- Patch 20394750: Oracle GoldenGate – APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS
- Patch 24835919: Oracle GoldenGate – IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- Patch 21171382: ADD CONTROL FOR AUTOMATIC CREATION OF STATS EXTENSIONS

- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 25031502: MV QUERY REWRITE WORKLOAD HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 23711335: CDB\_UPG PDCDB CDB UPGRADE AS WHOLE TAKES 1 MORE HOUR THAN PREVIOUS LABELS IN MAY
- Patch 32327179: JSON Bundle Patch
- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zip
- Java Cryptography Extension (JCE): Unlimited Strength Jurisdiction Policy Files for JVM version 6

## Combined patches for version 12.1.0.2.v23, released February 2021

Bugs fixed:

## Version 12.1.0.2.v22

Version 12.1.0.2.v22 includes the following:

- Patch 31550110: Database Patch Set Update : 12.1.0.2.201020 (31550110)
- Patch 31668915: Database PSU 12.1.0.2.201020, Oracle JavaVM Component (OCT2020)
- Patch 31335037: RDBMS - DSTV35 UPDATE - TZDATA2020A
- Patch 31335142: DSTV35 UPDATE - TZDATA2020A - NEED OJVM FIX
- Patch 17969866: Oracle GoldenGate – 46719 ENH REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES
- Patch 20394750: Oracle GoldenGate – APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS

- Patch 24835919: Oracle GoldenGate – IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 21171382: ADD CONTROL FOR AUTOMATIC CREATION OF STATS EXTENSIONS
- Patch 23711335: CDB\_UPG PDCDB CDB UPGRADE AS WHOLE TAKES 1 MORE HOUR THAN PREVIOUS LABELS IN MAY
- Patch 25031502: MV QUERY REWRITE WORKLOAD HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 31911280: JSON Bundle Patch
- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zip
- Support for [Setting and unsetting system diagnostic events \(p. 1058\)](#) using procedures in the `rdsadmin.rdsadmin_util` package
- Support for the procedure `rdsadmin_util.truncate_apply$_cdr_info` described in [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

## Combined patches for version 12.1.0.2.v22, released October 2020

Bugs fixed:

## Version 12.1.0.2.v21

Version 12.1.0.2.v21 includes the following:

- Patch 31113348: Database Patch Set Update 12.1.0.2.200714
- Patch 31219939: Database PSU 12.1.0.2.200714, Oracle JavaVM Component (JUL2020)
- Patch 31335037: DSTV35 for RDBMS (TZDATA2020A)
- Patch 31335142: DSTV35 for OJVM (TZDATA2020A)
- Patch 17969866: Oracle GoldenGate - 46719: ENH: REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES

- Patch 20394750: Oracle GoldenGate - APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS
- Patch 24835919: Oracle GoldenGate - IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 20033733: PART :IMC: HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- Patch 23711335: CDB\_UPG:PDCDB:CDB UPGRADE AS WHOLE TAKES 1 MORE HOUR THAN PREVIOUS LABELS IN MAY
- Patch 31579750: JSON bundle Patch
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 21171382: DBMS\_STATS Patch AUTO DOP COMPUTES A HIGH DOP UNNECESSARILY
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zip

## Combined patches for version 12.1.0.2.v21, released July 2020

Bugs fixed:

## Version 12.1.0.2.v20

Version 12.1.0.2.v20 includes the following:

- Patch 30700212: Database PSU 12.1.0.2.200414
- Patch 30805558: Oracle JVM Component Database PSU 12.1.0.2.200414
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- Patch 17969866: Oracle GoldenGate - 46719: ENH: REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES
- Patch 20394750: Oracle GoldenGate - APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS
- Patch 24835919: Oracle GoldenGate - IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- Patch 21171382: DBMS\_STATS Patch

- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 31164857: JSON bundle patch
- Patch 20033733: PART :IMC: HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zipn
- Support for [Purging the recycle bin \(p. 1074\)](#)
- Support for [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#) using the `rdsadmin.rdsadmin_diagnostic_util` package

## Combined patches for version 12.1.0.2, released April 2020

Bugs fixed:

## Version 12.1.0.2.v19

Version 12.1.0.2.v19 includes the following:

- Patch 30340202: DATABASE PATCH SET UPDATE 12.1.0.2.200114
- Patch 30502041: OJVM PATCH SET UPDATE 12.1.0.2.200114
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTv34 for OJVM (TZDATA2019G)
- Patch 17969866: Oracle GoldenGate - 46719: ENH: REPLICATION SUPPORT FOR INSERTS / FULL UPDATES WITH LARGE VALUES
- Patch 20394750: Oracle GoldenGate - APPLY CDR RESOLUTION FAILING FOR LOBS, XML, LONG, AND OBJECTS
- Patch 24835919: Oracle GoldenGate - IR EXECUTING DEPENDENT TRANSACTIONS OUT OF ORDER WITH PARALLELISM GREATER THAN
- Patch 23262847: Oracle GoldenGate - MALFORMED REDO CAUSED OGG REPLICATION ABEND
- Patch 21171382: DBMS\_STATS Patch
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 30708149: JSON bundle patch
- Patch 20033733: PART :IMC:HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR
- PreUpgrade Jar: preupgrade\_12.1.0.2.0\_18\_crlf.zip

## Oracle patch 29918340, released January 2020

Bugs fixed:

## Version 12.1.0.2.v17

Version 12.1.0.2.v17 includes the following:

- Patch 29494060: DATABASE PATCH SET UPDATE 12.1.0.2.190716
- Patch 29774383: OJVM PATCH SET UPDATE 12.1.0.2.190716
- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 24835919: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: DBMS\_STATS Patch
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 29958796: JSON bundle patch
- Patch 20033733: PART :IMC: HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]

- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle patch 29494060, released July 2019

Bugs fixed:

## Version 12.1.0.2.v16

Version 12.1.0.2.v16 includes the following:

- Patch 29141015: Database Patch Set Update: 12.1.0.2.190416
- Patch 29251241: OJVM PATCH SET UPDATE 12.1.0.2.190416
- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 24835919: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: DBMS\_STATS Patch
- Patch 21091901: ONLINE MOVE OF HASH OR REF PARTITION CAN LEAVE LOCAL INDEXES INCONSISTENT
- Patch 29600862: JSON bundle patch
- Patch 20033733: PART :IMC: HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle patch 22785785, released April 2019

Bugs fixed:

## Version 12.1.0.2.v15

Version 12.1.0.2.v15 includes the following:

- Patch 28729169: Oracle Database Patch Set Update 12.1.0.2.190115
- Patch 28790654: Oracle JVM Patch Set Update 12.1.0.2.190115
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 28127287: DSTv32 for OJVM (TZDATA2018E)
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: DBMS\_STATS Patch
- Patch 29125200: JSON bundle patch
- Patch 20033733: KGL heap size patch

### Oracle patch 28729169, released January 2019

Bugs fixed:

## Version 12.1.0.2.v14

Version 12.1.0.2.v14 includes the following:

- Patch 28259833: Oracle Database Patch Set Update 12.1.0.2.181016
- Patch 28440711: Oracle JVM Patch Set Update 12.1.0.2.181016
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 28127287: DSTv32 for OJVM (TZDATA2018E)
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: DBMS\_STATS Patch
- Patch 28697469: JSON Database Patch
- Patch 20033733: KGL heap size patch

### Oracle patch 28259833, released October 2018

Bugs fixed:

## Version 12.1.0.2.v13

Version 12.1.0.2.v13 includes the following:

- Patch 27547329: Oracle Database Patch Set Update 12.1.0.2.180717
- Patch 27923320: Oracle JVM Patch Set Update 12.1.0.2.180717
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)

- Patch 28127287: DSTv32 for OJVM (TZDATA2018E)
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: DBMS\_STATS Patch
- Patch 28307069: JSON Database Patch
- Patch 20033733: KGL heap size patch

## Oracle patch 27547329, released July 2018

Bugs fixed:

## Version 12.1.0.2.v12

Version 12.1.0.2.v12 includes the following:

- Patch 27338041: DATABASE PATCH SET UPDATE 12.1.0.2.180417
- Patch 27475603: OJVM PATCH SET UPDATE 12.1.0.2.180417
- Patch 27015449: RDBMS - PROACTIVE DSTV31 UPDATE - TZDATA2017C
- Patch 27015468: PROACTIVE DSTV31 UPDATE - TZDATA2017C - NEED OJVM FIX
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: AUTO DOP COMPUTES A HIGH DOP UNNECESSARILY
- Patch 27666699: JSON Database Patch
- Patch 20033733: PART :IMC: HIT ORA 600 [KGL-HEAP-SIZE-EXCEEDED]

### Oracle patch 27338041, released April 2018

Bugs fixed:

## Version 12.1.0.2.v11

Version 12.1.0.2.v11 includes the following:

- Patch 26925311: DATABASE PATCH SET UPDATE 12.1.0.2.180116
- Patch 27001733: OJVM PATCH SET UPDATE 12.1.0.2.180116
- Patch 27015449: RDBMS - PROACTIVE DSTV31 UPDATE - TZDATA2017C
- Patch 27015468: PROACTIVE DSTV31 UPDATE - TZDATA2017C - NEED OJVM FIX
- Patch 17969866: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 20394750: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 21171382: AUTO DOP COMPUTES A HIGH DOP UNNECESSARILY
- Patch 27315904: JSON Database Patch
- Patch 20033733: ORA 600 [KGL-HEAP-SIZE-EXCEEDED]

### Oracle patch 26925311, released January 2018

Bugs fixed:

## Version 12.1.0.2.v10

Version 12.1.0.2.v10 includes the following:

- Oracle October 2017 PSU, a combination of database PSU (patch 26713565) + OJVM component PSU (patch 26635845)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866)
- DBMS\_STATS AUTO DOP COMPUTES A HIGH DOP UNNECESSARILY (patch 21171382)
- JSON bundle patch (patch 26750145)
- KGL heap size patch (patch 20033733)
- Timezone file DSTv30 (patch 25881255, OJVM patch 25881271)

## Oracle patch 26713565, released October 2017
