## Version 12.1.0.2.v9

Version 12.1.0.2.v9 includes the following:

- Oracle July 2017 PSU, a combination of database PSU (patch 26609783) + OJVM component PSU (patch 26027162)

- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866)
- DBMS\_STATS AUTO DOP COMPUTES A HIGH DOP UNNECESSARILY (patch 21171382)
- JSON bundle patch (patch 26083365)
- KGL heap size patch (patch 20033733 for 12.1.0.2)
- Timezone file DSTv30 (patch 25881255, OJVM patch 25881271)
- Support for [Validating DB instance files \(p. 1085\)](#) with the `MAN` logical validation utility
- Support for [Setting the default edition for a DB instance \(p. 1069\)](#)

## Oracle patch 26609783, released July 2017

## Version 12.1.0.2.v8

Version 12.1.0.2.v8 includes the following:

- Oracle patch 25433980, a combination of database PSU (patch 25171037) + OJVM component PSU (patch 25437695)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866 for 12.1.0.2)
- Oracle Forms patch 18307021 for 12.1.0.2
- DBMS\_STATS Patch (patch 21171382 for 12.1.0.2)
- JSON bundle patch (patch 25531469 for 12.1.0.2)
- KGL heap size patch (patch 20033733 for 12.1.0.2)
- Fixed a bug that affected PSU apply after upgrade to 12.1.0.2.v5, v6, and v7
- Timezone file DSTv28 (patch 24701840)
- Support for the `DBMS_CHANGE_NOTIFICATION` package
- Support for `XSTREAM` packages and views (may require additional licensing)

## Oracle patch 25171037, released April 2017

Bugs fixed:

## Version 12.1.0.2.v7

Version 12.1.0.2.v7 includes the following:

- Oracle patch 24917069, a combination of database PSU (patch 24732082) + OJVM component PSU (patch 24917972)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866 for 12.1.0.2)
- Oracle Forms patch 18307021 for 12.1.0.2
- DBMS\_STATS Patch (patch 21171382 for 12.1.0.2)
- JSON bundle patch (patch 25089615 for 12.1.0.2)
- KGL heap size patch (patch 20033733 for 12.1.0.2)

## Oracle patch 24917069, released January 2017

## Version 12.1.0.2.v6

Version 12.1.0.2.v6 includes the following:

- Oracle patch 24433133, a combination of database PSU (patch 24006101) + OJVM component PSU (patch 24315824)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866 for 12.1.0.2)
- Oracle Forms patch 18307021 for 12.1.0.2
- DBMS\_STATS Patch (patch 21171382 for 12.1.0.2)
- JSON bundle patch (patch 24568656 for 12.1.0.2)
- Fixed a bug that caused 12c upgrade scripts to drop customer directories

- Made DIAG log directory available to customers

## Baseline: Oracle database patch set update 12.1.0.2.161018 (patch 24006101, released October 2016)

Bugs fixed:

## Version 12.1.0.2.v5

Version 12.1.0.2.v5 includes the following:

- Oracle patch 23615289, a combination of database PSU (patch 23054246) + OJVM component PSU (patch 23177536)
- Timezone file DSTv26 (patch 22873635 for 12.1.0.2)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866 for 12.1.0.2)
- Oracle Forms patch 18307021 for 12.1.0.2
- Ability to create custom password verify functions (see [Creating custom functions to verify passwords \(p. 1054\)](#))
- Fixed a bug that prevented implicit recompilation of views owned by SYS

**Baseline: Oracle database patch set update 12.1.0.2.160719 (patch 23054246, released July 2016)**

## Version 12.1.0.2.v4

Version 12.1.0.2.v4 includes the following:

- Oracle PSU 12.1.0.2.160419 (22291127)
- Timezone file DSTv25 (patch 22037014)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 17969866)
- Adds the ability for the master user to grant the EM\_EXPRESS\_BASIC and EM\_EXPRESS\_ALL roles
- Adds the ability for the master user to grant privileges on SYS objects with the grant option using the RDSADMIN.RDSADMIN\_UTIL.GRANT\_SYS\_OBJECT procedure
- Adds master user privileges to support most common schemas created by the Oracle Fusion Middleware Repository Creation Utility (RCU)

**Baseline: Oracle database patch set update 12.1.0.2.160419 (patch 22291127, released April 2016)**

## Version 12.1.0.2.v3

Version 12.1.0.2.v3 includes the following:

- Oracle PSU 12.1.0.2.160119 (21948354).
- Timezone file DSTv25 (patch 22037014 for 12.1.0.2). 12.1.0.1 includes DSTv24, patch 20875898 (unchanged from 12.1.0.1.v3), because a backport of DSTv25 was unavailable at build time.
- Fixed an issue that prevented customers from creating more than 10 Directory objects in the database.
- Fixed an issue that prevented customers from re-granting read privileges on the ADUMP and BDUMP Directory objects.

**Baseline: Oracle database patch set update 12.1.0.2.160119 (patch 21948354, released January 2016)**

## Version 12.1.0.2.v2

Version 12.1.0.2.v2 includes the following:

- Oracle PSU 12.1.0.2.5 (21359755)
- Includes the Daylight Saving Time Patch, patch 20875898: DST-24, that came out after the April 2015 PSU.

**Baseline: Oracle database patch set update 12.1.0.2.5 (patch 21359755, released October 2015)**

Bugs fixed:

19189525, 19075256, 19865345, 19791273, 19280225, 18845653, 19248799 19243521, 18988834, 19238590, 21281532, 18921743, 20245930, 19134173 19571367, 20476175, 20925795, 19018206, 20387265, 19149990, 18849537 19183343, 19703301, 19001390, 18202441, 19189317, 19644859, 19390567 19358317, 19279273, 19706965, 19068970, 19619732, 18607546, 20348653 18940497, 19670108, 19649152, 18948177, 19315691, 19676905, 18964978 20165574, 19035573, 19176326, 20413820, 20558005, 19176223, 19532017 20134339, 19074147, 18411216, 20361671, 20425790, 18966843, 20294666 19371175, 19307662, 19195895, 19154375, 19468991, 19174521, 19520602 19382851, 19658708, 20093776, 17835294, 19068610, 19791377, 20746251 20048359, 19143550, 19185876, 19627012, 20281121, 19577410, 19001359 19518079, 18610915, 18674024, 18306996, 19309466, 19081128, 19915271 20122715, 20284155, 18791688, 21442094, 19303936, 19597439, 20235511 18964939, 19430401, 19044962, 19409212, 20657441, 19684504, 19024808 19028800, 19065556, 19723336, 19077215, 21421886, 19524384, 19048007 18288842, 18952989, 16870214, 19928926, 19180770, 19197175, 19730508 19012119, 19067244, 20074391, 19841800, 19512341, 14643995, 20331945 19587324, 19065677, 19547370, 19637186, 21225209, 20397490, 18967382 19174430, 18674047, 19054077, 19708632, 19536415, 19289642, 19335438 17365043, 18856999, 20471920, 19468347, 21620471, 16359751, 18990693 19439759, 19769480, 19272708, 19978542, 19329654, 20402832, 19873610 19304354, 19052488, 19291380, 18681056, 19896336, 19076343, 19561643 18618122, 20440930, 18456643, 19699191, 18909599, 19487147, 18250893 19016730, 18743542, 20347562, 16619249, 18354830, 19687159, 19174942 20424899, 19989009, 20688221, 20441797, 19157754, 19058490, 19032777 19399918, 18885870, 19434529, 19018447, 18417036, 20919320, 19284031 19022470, 20474192, 22062026, 19385656, 19501299, 17274537, 20899461 19440586, 19606174, 18436647, 19023822, 19178851, 19124589, 19805359 19597583, 19155797, 19393542, 19050649

## Version 12.1.0.2.v1

Version 12.1.0.2.v1 includes the following:

- Oracle PSU 12.1.0.2.3 (20299023)
- The In-Memory option allows storing a subset of data in an in-memory column format optimized for performance.
- Installs additional Oracle Text knowledge bases from Oracle Database. Examples media (English and French)
- Provides access to DBMS\_REPAIR through RDSADMIN.RDSADMIN\_DBMS\_REPAIR
- Grants ALTER DATABASE LINK, ALTER PUBLIC DATABASE LINK, EXEMPT ACCESS POLICY, EXEMPT IDENTITY POLICY, and EXEMPT REDACTION POLICY to master user

### Note

Version 12.1.0.2.v1 supports Enterprise Edition only.

## Database engine: 11.2.0.4

The following versions are available for database engine 11.2.0.4

- [Version 11.2.0.4.v26 \(p. 1449\)](#)
- [Version 11.2.0.4.v25 \(p. 1452\)](#)
- [Version 11.2.0.4.v24 \(p. 1455\)](#)
- [Version 11.2.0.4.v23 \(p. 1457\)](#)
- [Version 11.2.0.4.v22 \(p. 1460\)](#)
- [Version 11.2.0.4.v21 \(p. 1462\)](#)

- [Version 11.2.0.4.v20 \(p. 1464\)](#)
- [Version 11.2.0.4.v19 \(p. 1466\)](#)
- [Version 11.2.0.4.v18 \(p. 1468\)](#)
- [Version 11.2.0.4.v17 \(p. 1469\)](#)
- [Version 11.2.0.4.v16 \(p. 1471\)](#)
- [Version 11.2.0.4.v15 \(p. 1473\)](#)
- [Version 11.2.0.4.v14 \(p. 1474\)](#)
- [Version 11.2.0.4.v13 \(p. 1476\)](#)
- [Version 11.2.0.4.v12 \(p. 1477\)](#)
- [Version 11.2.0.4.v11 \(p. 1479\)](#)
- [Version 11.2.0.4.v10 \(p. 1480\)](#)
- [Version 11.2.0.4.v9 \(p. 1482\)](#)
- [Version 11.2.0.4.v8 \(p. 1483\)](#)
- [Version 11.2.0.4.v7 \(p. 1484\)](#)
- [Version 11.2.0.4.v6 \(p. 1486\)](#)
- [Version 11.2.0.4.v5 \(p. 1486\)](#)
- [Version 11.2.0.4.v4 \(p. 1487\)](#)
- [Version 11.2.0.4.v3 \(p. 1488\)](#)
- [Version 11.2.0.4.v2 \(deprecated\) \(p. 1489\)](#)
- [Version 11.2.0.4.v1 \(p. 1490\)](#)

**Important**

RDS for Oracle Database 11g is deprecated. This information is only useful if you want to upgrade an Oracle Database 11g snapshot.

## Version 11.2.0.4.v26

**Important**

This patch is currently only available for Oracle Database Enterprise Edition.

Version 11.2.0.4.v26 includes the following:

- Patch 31537677: Oracle Database Patch Set Update 11.2.0.4.201020
- Patch 31668908: Oracle JavaVM Component 11.2.0.4.201020 Database PSU
- Patch 22188219: "L1 VALIDATION" WAIT EVENT USED TO BACK OFF WHEN HW ENQUEUE CANNOT BE ACQUIRED
- Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 32076719: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.201020 FOR BUGS 2990912 13254780
- Patch 24010393: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.6 FOR BUGS 12897813 21281961
- Patch 17031322: OCIXMLDBREWRITEXML RETURNED BIND VARIABLES ARE NOT WHITESPACE PRESERVING
- Patch 19277336: INTEGRATED REPLICAT INVALIDATES DEPENDENT PACKAGES RESULTING IN AN ORA-4068
- Patch 19306797: HEARTBEAT REDO IS NOT GENERATED NON-RAC HOSTS WHEN SUPPLEMENTAL LOGGING ENABLED
- Patch 19440386: FAILED TO RAISE ORA-1 FOR PK UPDATE WHEN CONSTRAINT=IMMEDIATE
- Patch 19563715: LOGMINER DOES NOT MAKE PROGRESS WHEN 4GB OR MORE MEMORY IS USED IN GOLDENGATE

- Patch 20647412: EDITION NAME LOGGED WITH KNLD SHOULD BE THE CURRENT EDITION, NOT SESSION EDITION
- Patch 26744595: LGSB:APPLY ABORTS W/ ORA-26786 (ROW-EXISTS) COLLISION WITH HCC(PR)-NO HCC(SB)
- Patch 12668795: ORA-00600: [KDUCFA:ENDBIT] SEEN DURING XSTREAMS ONEWAY REPLICATION
- PreUpgrade Jar: preupgrade\_19\_cbuild\_8\_1f.zip
- Support for [Setting and unsetting system diagnostic events \(p. 1058\)](#) using procedures in the `rdsadmin.rdsadmin_util` package
- Support for the procedure `rdsadmin_util.truncate_apply$_cdr_info` described in [Integrated REPLICAT slow due to query on sys."\\_DBA\\_APPLY\\_CDR\\_INFO" \(p. 1248\)](#)

## Combined patches for version 11.2.0.4.v26, released November 2020

## Version 11.2.0.4.v25

Version 11.2.0.4.v25 includes the following:

- Patch 31103343: Database Patch Set Update 11.2.0.4.200714
- Patch 31219953: Oracle JVM Component Database PSU 11.2.0.4.200714
- Patch 31335037: DSTV35 for RDBMS (TZDATA2020A)
- Patch 31335142: DSTV35 for OJVM (TZDATA2020A)
- Patch 31596256: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 22188219: "L1 VALIDATION" WAIT EVENT USED TO BACK OFF WHEN HW ENQUEUE CANNOT BE ACQUIRED
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Combined patches for version 11.2.0.4.v25, released July 2020

Bugs fixed:

## Version 11.2.0.4.v24

Version 11.2.0.4.v24 includes the following:

- Patch 30670774: Database PSU 11.2.0.4.200414
- Patch 30805543: Oracle JVM Component Database PSU 11.2.0.4.200414
- Patch 29997937: DSTv34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTV34 OJVM (TZDATA2019B)
- Patch 31192454: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 22188219: "L1 VALIDATION" WAIT EVENT USED TO BACK OFF WHEN HW ENQUEUE CANNOT BE ACQUIRED
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR support for [Purging the recycle bin \(p. 1074\)](#).
- Support for [Generating performance reports with Automatic Workload Repository \(AWR\) \(p. 1065\)](#) using the `rdsadmin.rdsadmin_diagnostic_util` package

## Combined patches for version 11.2.0.4, released April 2020

## Version 11.2.0.4.v23

Version 11.2.0.4.v23 includes the following:

- Patch 30298532: Database Patch Set Update: 11.2.0.4.200114
- Patch 30503372: OJVM PATCH SET UPDATE 11.2.0.4.200114
- Patch 29997937: DSTV34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTV34 OJVM (TZDATA2019B)
- Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 19440386: FAILED TO RAISE ORA-1 FOR PK UPDATE WHEN CONSTRAINT=IMMEDIATE
- Patch 19277336: INTEGRATED REPLICAT INVALIDATES DEPENDENT PACKAGES RESULTING IN AN ORA-4068
- Patch 24286409: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.6 FOR BUGS 20647412 21534893

- Patch 24010393: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.6 FOR BUGS 12897813 21281961
- Patch 19306797: HEARTBEAT REDO IS NOT GENERATED NON-RAC HOSTS WHEN SUPPLEMENTAL LOGGING ENABLED
- Patch 19563715: LOGMINER DOES NOT MAKE PROGRESS WHEN 4GB OR MORE MEMORY IS USED IN GOLDENGATE
- Patch 20425790: LOGMINER PATCHES SHOULD TRANSPARENTLY FUNCTION IN A NON-PARTITIONING ENABLED DB
- Patch 17031322: 46719: OCIXMLDBREWRITEXML RETURNED BIND VARIABLES ARE NOT WHITESPACE PRESERVING
- Patch 30303921: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.190416 FOR BUGS 29879564 14312810
- Patch 30293609: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.190416 FOR BUGS 29600521 23262847
- Patch 26744595: LGSB:APPLY ABORTS W/ ORA-26786 (ROW-EXISTS) COLLISION WITH HCC(PR)-NO HCC(SB)
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle patch 30298532, released January 2020

Bugs fixed:

## Version 11.2.0.4.v22

Version 11.2.0.4.v22 includes the following:

- Patch 29913194: DATABASE PATCH SET UPDATE 11.2.0.4.191015
- Patch 30132974: OJVM PATCH SET UPDATE 11.2.0.4.191015
- Patch 29997937: DSTV34 for RDBMS (TZDATA2019G)
- Patch 29997959: DSTV34 OJVM (TZDATA2019B)
- Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 19440386: FAILED TO RAISE ORA-1 FOR PK UPDATE WHEN CONSTRAINT=IMMEDIATE
- Patch 19277336: INTEGRATED REPLICAT INVALIDATES DEPENDENT PACKAGES RESULTING IN AN ORA-4068
- Patch 24286409: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.6 FOR BUGS 20647412 21534893
- Patch 24010393: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.6 FOR BUGS 12897813 21281961
- Patch 19306797: HEARTBEAT REDO IS NOT GENERATED NON-RAC HOSTS WHEN SUPPLEMENTAL LOGGING ENABLED
- Patch 19563715: LOGMINER DOES NOT MAKE PROGRESS WHEN 4GB OR MORE MEMORY IS USED IN GOLDENGATE
- Patch 20425790: LOGMINER PATCHES SHOULD TRANSPARENTLY FUNCTION IN A NON-PARTITIONING ENABLED DB
- Patch 17031322: 46719: OCIXMLDBREWRITEXML RETURNED BIND VARIABLES ARE NOT WHITESPACE PRESERVING
- Patch 30303921: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.190416 FOR BUGS 29879564 14312810
- Patch 30293609: MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.190416 FOR BUGS 29600521 23262847
- Patch 26744595: LGSB:APPLY ABORTS W/ ORA-26786 (ROW-EXISTS) COLLISION WITH HCC(PR)-NO HCC(SB)
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

### Oracle patch 29913194, released October 2019

Bugs fixed:

## Version 11.2.0.4.v21

Version 11.2.0.4.v21 includes the following:

- Patch 29497421: DATABASE PATCH SET UPDATE 11.2.0.4.190716
- Patch 29610422: OJVM PATCH SET UPDATE 11.2.0.4.190716
- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- Patch 30018733: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle patch 29497421, released July 2019

Bugs fixed:

## Version 11.2.0.4.v20

Version 11.2.0.4.v20 includes the following:

- Patch 29141056: DATABASE PATCH SET UPDATE 11.2.0.4.190416
- Patch 29251270: OJVM PATCH SET UPDATE 11.2.0.4.190416
- Patch 28852325: DSTv33 for RDBMS (TZDATA2018G)
- Patch 28852334: DSTv33 for OJVM (TZDATA2018G)
- Patch 29638593: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 28730253: SUPPORT NEW ERA REIWA FOR JAPANESE IMPERIAL CALENDAR

## Oracle patch 22768427, released April 2019

Bugs fixed:

## Version 11.2.0.4.v19

Version 11.2.0.4.v19 includes the following:

- Patch 28729262: Oracle Database Patch Set Update 11.2.0.4.190115
- Patch 28790660: Oracle JVM Patch Set Update 11.2.0.4.190115
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 27015468: DSTv32 for OJVM (TZDATA2018E)
- Patch 27216420: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches

## Oracle patch 28729262, released January 2019

Bugs fixed:

```

## Version 11.2.0.4.v18

Version 11.2.0.4.v18 includes the following:

- Patch 28204707: Oracle Database Patch Set Update 11.2.0.4.181016
- Patch 28440700: Oracle JVM Patch Set Update 11.2.0.4.181016
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)
- Patch 27015468: DSTv32 for OJVM (TZDATA2018E)
- Patch 27216420: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patches 27659043 and 19692824 are now included in the Database Patch Set Update

### Oracle patch 28204707, released October 2018

Bugs fixed:

## Version 11.2.0.4.v17

Version 11.2.0.4.v17 includes the following:

- Patch 27734982: Oracle Database Patch Set Update 11.2.0.4.180717
- Patch 27923163: Oracle JVM Patch Set Update 11.2.0.4.180717
- Patch 28125601: DSTv32 for RDBMS (TZDATA2018E)

- Patch 27015468: DSTv32 for OJVM (TZDATA2018E)
- Patch 27216420: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 27659043: MES Bundle 405
- Patch 19692824: DBCONTROL is not coming up on OEL 7

## Oracle patch 27734982, released July 2018

Bugs fixed:

```

## Version 11.2.0.4.v16

Version 11.2.0.4.v16 includes the following:

- Patch 27338049: DATABASE PATCH SET UPDATE 11.2.0.4.180417
- Patch 27475598: OJVM PATCH SET UPDATE 11.2.0.4.180417
- Patch 27015449: RDBMS - PROACTIVE DSTV31 UPDATE - TZDATA2017C
- Patch 27015468: PROACTIVE DSTV31 UPDATE - TZDATA2017C - NEED OJVM FIX
- Patch 27216420: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 27659043: MES 405 BUNDLE ON TOP OF RDBMS 11.2.0.4.180116 PSU
- Patch 19692824: DBCONTROL is not coming up on OEL 7
- Support for the DBMS\_ADVANCED\_REWRITE package
- Fixed a bug where DBA\_LOCKS and associated views available in new DB instances of 11.2.0.4.v15 were not created in upgrades to 11.2.0.4.v15. Views are now created in new and upgraded DB instances of 11.2.0.4.v16 and later.

### Oracle patch 27338049, released April 2018

Bugs fixed:

## Version 11.2.0.4.v15

Version 11.2.0.4.v15 includes the following:

- Patch 26925576: DATABASE PATCH SET UPDATE 11.2.0.4.180116
- Patch 26925532: OJVM PATCH SET UPDATE 11.2.0.4.180116
- Patch 27015449: RDBMS - PROACTIVE DSTV31 UPDATE - TZDATA2017C
- Patch 27015468: PROACTIVE DSTV31 UPDATE - TZDATA2017C - NEED OJVM FIX
- Patch 27216420: Oracle GoldenGate - Oracle RDBMS Server Recommended Patches
- Patch 27244661: MES 405 BUNDLE ON TOP OF RDBMS 11.2.0.4.180116 PSU
- Patch 19692824: DBCONTROL is not coming up on OEL 7
- Support for DBA\_LOCKS and associated views

## Oracle patch 26925576, released January 2018

Bugs fixed:

17288409, 21051852, 24316947, 17811429, 17205719, 18607546, 25654936 17816865, 20506699, 24835538, 25957038, 23330119, 17922254, 17754782 13364795, 16934803, 17311728, 20387265, 17284817, 17441661, 20671094 24560906, 16992075, 17446237, 14015842, 19972569, 21756677, 17375354 21538558, 20925795, 17449815, 26575788, 19463897, 13866822, 17235750 17982555, 17478514, 18317531, 14338435, 18235390, 20803583, 19461270 19475971, 13944971, 20142975, 17811789, 16929165, 18704244, 24662775 20506706, 21422580, 17546973, 20334344, 14054676, 25489607, 17088068 17346091, 18264060, 17343514, 21538567, 19680952, 18471685, 19211724 21132297, 13951456, 16315398, 21847223, 18744139, 16850630, 23177648 19049453, 18090142, 18673304, 17883081, 19915271, 18641419, 18262334 25600421, 17006183, 16065166, 18277454, 16833527, 10136473, 18051556 17865671, 18554871, 17852463, 17853498, 18334586, 20879889, 17551709 17588480, 19827973, 17344412, 17842825, 18828868, 20509482, 17025461 13609098, 11883252, 17239687, 23007241, 17602269, 19197175, 18316692 22195457, 17313525, 12611721, 21174504, 19544839, 18964939, 17600719 26667015, 18191164, 17571306, 19393542, 20777150, 18482502, 19466309 22243719, 17165204, 17040527, 18098207, 16785708, 17465741, 16180763 17174582, 12982566, 16777840, 19463893, 22195465, 16875449, 22148226 12816846, 17237521, 6599380, 19358317, 17811438, 25505394, 17811447 21983325, 17945983, 18762750, 16912439, 17184721, 20598042, 18061914 21380789, 17282229, 18948177, 18331850, 21142837, 18202441, 17082359 18723434, 21972320, 21532755, 19554106, 25505371, 14034426, 18339044 19458377, 17752995, 20448824, 17891943, 17767676, 17258090, 16668584 18384391, 17040764, 17381384, 15913355, 18356166, 14084247, 20596234

## Version 11.2.0.4.v14

Version 11.2.0.4.v14 includes the following:

- Oracle October 2017 PSU, a combination of database PSU (patch 26392168) + OJVM component PSU (patch 26635834)

- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 26950781)
- RSA Micro-Edition Suite Bundle (patch 26963526)
- Timezone file DSTv30 (patch 25881255, OJVM patch 25881271)

## Oracle patch 26392168, released October 2017

### Bugs fixed:

## Version 11.2.0.4.v13

Version 11.2.0.4.v13 includes the following:

- Oracle July 2017 PSU, a combination of database PSU (patch 26609445) + OJVM component PSU (patch 26027154)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 26554712)
- RSA Micro-Edition Suite Bundle (patch 26770426)
- Timezone file DSTv30 (patch 25881255, OJVM patch 25881271)
- Support for [Validating DB instance files \(p. 1085\)](#) with the `RMAN` logical validation utility
- Support for [Setting the default edition for a DB instance \(p. 1069\)](#)

## Oracle patch 26609445, released July 2017

## Version 11.2.0.4.v12

Version 11.2.0.4.v12 includes the following:

- Oracle patch 25440428, a combination of database PSU (patch 24732075) + OJVM component PSU (patch 25434033)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 25734992)

- MES Bundle (patch 24975421 for 11.2.0.4)
- Timezone file DSTv28 (patch 24701840)
- Support for the DBMS\_CHANGE\_NOTIFICATION package
- Support for XSTREAM packages and views (may require additional licensing)

## Oracle patch 24732075, released April 2017

### Bugs fixed:

## Version 11.2.0.4.v11

Version 11.2.0.4.v11 includes the following:

- Oracle patch 24918033, a combination of database PSU (patch 24006111) + OJVM component PSU (patch 24917954)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 24491261)
- MES Bundle (patch 24975421 for 11.2.0.4)

## Oracle patch 24918033, released January 2017

## Version 11.2.0.4.v9

Version 11.2.0.4.v9 includes the following:

- Oracle patch 23615392, a combination of database PSU (patch 23054359) + OJVM component PSU (patch 23177551)
- Timezone file DSTv26 (patch 22873635 for 11.2.0.4)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 24320398 for 11.2.0.4.160719)
- MES Bundle (patch 22695784 for 11.2.0.4)
- Added the ability to create custom password verify functions. For more information, see [Creating custom functions to verify passwords \(p. 1054\)](#).
- Fixed a bug that prevented implicit recompilation of views owned by SYS

**Baseline: Oracle database patch set update 11.2.0.4.160719 (patch 23054359, released July 2016)**

Bugs fixed:

## Version 11.2.0.4.v8

Version 11.2.0.4.v8 includes the following:

- Oracle PSU 11.2.0.4.160419 (22502456)
- Timezone file DSTv25 (patch 22037014)
- Oracle recommended RDBMS patches for Oracle GoldenGate (patch 22576728)
- MES Bundle (patch 22695784 for 11.2.0.4)
- Adds the ability for the master user to grant privileges on SYS objects with the grant option using the RDSADMIN.RDSADMIN\_UTIL.GRANT\_SYS\_OBJECT procedure
- Adds master user privileges to support most common schemas created by the Oracle Fusion Middleware Repository Creation Utility (RCU)

**Baseline: Oracle database patch set update 11.2.0.4.160419 (patch 22502456, released April 2016)**

## Version 11.2.0.4.v7

Version 11.2.0.4.v7 includes the following:

- Oracle PSU 11.2.0.4.160119 (21948347)
- Timezone file DSTv25 - patch 22037014 for 11.2.0.4 and 12.1.0.2 (12.1.0.1 includes DSTv24, patch 20875898 (unchanged from 12.1.0.1.v3), as a backport of DSTv25 was unavailable at build time)
- Fixed an issue that prevented customers from creating more than 10 Directory objects in the database

- Fixed an issue that prevented customers from re-granting read privileges on the ADUMP and BDUMP Directory objects

## Baseline: Oracle database patch set update 11.2.0.4.160119 (patch 21948347, released January 2016)

## Version 11.2.0.4.v6

Version 11.2.0.4.v6 includes the following:

- Enable SSL encryption for Standard Edition and Standard Edition One

## Version 11.2.0.4.v5

Version 11.2.0.4.v5 includes the following:

- Oracle PSU 11.2.0.4.8 (21352635)
- Includes the Daylight Saving Time Patch, patch 20875898: DST-24, that came out after the April 2015 PSU.

**Baseline: Oracle database patch set update 11.2.0.4.8 (patch 21352635, released October 2015)**

## Version 11.2.0.4.v4

Version 11.2.0.4.v4 includes the following:

- Oracle PSU 11.2.0.4.6 (20299013)
- Installs additional Oracle Text knowledge bases from Oracle Database. Examples media (English and French)
- Provides access to DBMS\_REPAIR through RDSADMIN.RDSADMIN\_DBMS\_REPAIR
- Grants ALTER DATABASE LINK, ALTER PUBLIC DATABASE LINK, EXEMPT ACCESS POLICY, EXEMPT IDENTITY POLICY, and EXEMPT REDACTION POLICY to master user

**Baseline: Oracle database patch set update 11.2.0.4.6 (patch 20299013, released April 2015)**

## Version 11.2.0.4.v3

Version 11.2.0.4.v3 includes the following:

- Oracle PSU 11.2.0.4.4 (19121551)
- Latest DST file (DSTv23 – patch 19396455, released Oct 2014). This patch is incorporated by default in new instances only.

**Baseline: Oracle database patch set update 11.2.0.4.4 (patch 19121551, released October 2014)**

Bugs fixed:

## Version 11.2.0.4.v2 (deprecated)

Version 11.2.0.4.v2 includes the following:

- Oracle PSU 11.2.0.4.3 (18522509)
- User access to DBMS\_TRANSACTION package to clean-up failed distributed transactions
- Latest DST file (DSTv22 – patch 18759211, released June 2014). This patch is incorporated by default only in new Oracle DB instances.
- Grants DBMS\_REPUTIL to DBA role (upgrade to 11.2.0.4 revokes it from public)
- Privileges granted on DBMS\_TRANSACTION, v\$pending\_xatrans\$, and v\$xatrans\$
- Resolves a problem with DDL commands when user objects have "SYSTEM" in their names
- Installs schema objects to support XA Transactions, allowing transactions to be managed by an external transaction manager
- Permits truncation of temporary SYS and SYSTEM objects, allowing tools like LogMiner to function correctly

**Baseline: Oracle database patch set update 11.2.0.4.3 (patch 18522509, released July 2014)**

# PostgreSQL on Amazon RDS

Amazon RDS supports DB instances running several versions of PostgreSQL. You can create DB instances and DB snapshots, point-in-time restores and backups. DB instances running PostgreSQL support Multi-AZ deployments, read replicas, Provisioned IOPS, and can be created inside a VPC. You can also use Secure Socket Layer (SSL) to connect to a DB instance running PostgreSQL.

Before creating a DB instance, you should complete the steps in the [Setting up for Amazon RDS \(p. 66\)](#) section of this guide.

You can use any standard SQL client application to run commands for the instance from your client computer. Such applications include *pgAdmin*, a popular Open Source administration and development tool for PostgreSQL, or *psql*, a command line utility that is part of a PostgreSQL installation. To deliver a managed service experience, Amazon RDS doesn't provide host access to DB instances, and it restricts access to certain system procedures and tables that require advanced privileges. Amazon RDS supports access to databases on a DB instance using any standard SQL client application. Amazon RDS doesn't allow direct host access to a DB instance by using Telnet or Secure Shell (SSH).

Amazon RDS for PostgreSQL is compliant with many industry standards. For example, you can use Amazon RDS for PostgreSQL databases to build HIPAA-compliant applications and to store healthcare-related information, including protected health information (PHI) under a completed Business Associate Agreement (BAA) with AWS. Amazon RDS for PostgreSQL also meets Federal Risk and Authorization Management Program (FedRAMP) security requirements. Amazon RDS for PostgreSQL has received a FedRAMP Joint Authorization Board (JAB) Provisional Authority to Operate (P-ATO) at the FedRAMP HIGH Baseline within the AWS GovCloud (US) Regions. For more information on supported compliance standards, see [AWS cloud compliance](#).

To import PostgreSQL data into a DB instance, follow the information in the [Importing data into PostgreSQL on Amazon RDS \(p. 1586\)](#) section.

# Common management tasks for PostgreSQL on Amazon RDS

The following are the common management tasks you perform with an Amazon RDS for PostgreSQL DB instance, with links to relevant documentation for each task.

Task area	Relevant documentation
<b>Setting up Amazon RDS for first-time use</b>  There are prerequisites you must complete before you create your DB instance. For example, DB instances are created by default with a firewall that prevents access to it. You therefore must create a security group with the correct IP addresses and network configuration to access the DB instance.	<a href="#">Setting up for Amazon RDS (p. 66)</a>
<b>Understanding Amazon RDS DB instances</b>  If you are creating a DB instance for production purposes, you should understand how instance classes, storage types, and Provisioned IOPS work in Amazon RDS.	<a href="#">DB instance classes (p. 7)</a>  <a href="#">Amazon RDS storage types (p. 40)</a>  <a href="#">Provisioned IOPS SSD storage (p. 42)</a>
<b>Finding supported PostgreSQL versions</b>  Amazon RDS supports several versions of PostgreSQL.	<a href="#">Supported PostgreSQL database versions (p. 1499)</a>
<b>Setting up high availability and failover support</b>  A production DB instance should use Multi-AZ deployments. Multi-AZ deployments provide increased availability, data durability, and fault tolerance for DB instances.	<a href="#">High availability (Multi-AZ) for Amazon RDS (p. 52)</a>
<b>Understanding the Amazon Virtual Private Cloud (VPC) network</b>  If your AWS account has a default VPC, then your DB instance is automatically created inside the default VPC. In some cases, your account might not have a default VPC, and you might want the DB instance in a VPC. In these cases, create the VPC and subnet groups before you create the DB instance.	<a href="#">Determining whether you are using the EC2-VPC or EC2-Classic platform (p. 1756)</a>  <a href="#">Working with a DB instance in a VPC (p. 1765)</a>
<b>Importing data into Amazon RDS PostgreSQL</b>  You can use several different tools to import data into your PostgreSQL DB instance on Amazon RDS.	<a href="#">Importing data into PostgreSQL on Amazon RDS (p. 1586)</a>
<b>Setting up read-only read replicas (primary and standbys)</b>  PostgreSQL on Amazon RDS supports read replicas in both the same AWS Region and in a different AWS Region from the primary instance.	<a href="#">Working with read replicas (p. 279)</a>  <a href="#">Working with PostgreSQL read replicas in Amazon RDS (p. 1582)</a>  <a href="#">Creating a read replica in a different AWS Region (p. 292)</a>

Task area	Relevant documentation
<p><b>Understanding security groups</b></p> <p>By default, DB instances are created with a firewall that prevents access to them. You therefore must create a security group with the correct IP addresses and network configuration to access the DB instance.</p> <p>In general, if your DB instance is on the EC2-Classic platform, you need to create a DB security group. If your DB instance is on the EC2-VPC platform, you need to create a VPC security group.</p>	<p><a href="#">Determining whether you are using the EC2-VPC or EC2-Classic platform (p. 1756)</a></p> <p><a href="#">Controlling access with security groups (p. 1737)</a></p>
<p><b>Setting up parameter groups and features</b></p> <p>If your DB instance is going to require specific database parameters, you should create a parameter group before you create the DB instance.</p>	<p><a href="#">Working with DB parameter groups (p. 229)</a></p>
<p><b>Performing common DBA tasks for PostgreSQL</b></p> <p>Some of the more common tasks for PostgreSQL DBAs include:</p> <ul style="list-style-type: none"> <li>• <a href="#">Creating roles (p. 1616)</a></li> <li>• <a href="#">Managing PostgreSQL database access (p. 1617)</a></li> <li>• <a href="#">Working with PostgreSQL parameters (p. 1617)</a></li> <li>• <a href="#">Working with PostgreSQL autovacuum on Amazon RDS (p. 1631)</a></li> <li>• <a href="#">Audit logging for a PostgreSQL DB instance (p. 1626)</a></li> <li>• <a href="#">Working with the PostGIS extension (p. 1640)</a></li> <li>• <a href="#">Using pgBadger for log analysis with PostgreSQL (p. 1628)</a></li> <li>• <a href="#">Using a custom DNS server for outbound network access (p. 1643)</a></li> </ul>	<p><a href="#">Common DBA tasks for PostgreSQL (p. 1616)</a></p>

# Working with the database preview environment

When you create a DB instance in Amazon RDS, you know that the PostgreSQL version it's based on has been tested and is fully supported by Amazon. The PostgreSQL community releases new versions and new extensions continuously. You can try out new PostgreSQL versions and extensions before they are fully supported. To do that, you can create a new DB instance in the Database Preview Environment.

DB instances in the Database Preview Environment are similar to DB instances in a production environment. However, keep in mind several important factors:

- All DB instances are deleted 60 days after you create them, along with any backups and snapshots.
- You can only create a DB instance in a virtual private cloud (VPC) based on the Amazon VPC service.
- You can only create M6g, M5, T3, R6g, and R5 instance types. For more information about RDS instance classes, see [DB instance classes \(p. 7\)](#).
- You can only use General Purpose SSD and Provisioned IOPS SSD storage.
- You can't get help from AWS Support with DB instances. You can post your questions in the [RDS database preview environment forum](#).
- You can't copy a snapshot of a DB instance to a production environment.
- You can use both single-AZ and multi-AZ deployments.
- You can use standard PostgreSQL dump and load functions to export databases from or import databases to the Database Preview Environment.

## Topics

- [Features not supported in the preview environment \(p. 1495\)](#)
- [PostgreSQL extensions supported in the preview environment \(p. 1495\)](#)
- [Creating a new DB instance in the preview environment \(p. 1497\)](#)

## Features not supported in the preview environment

The following features are not available in the preview environment:

- Cross-region snapshot copy
- Cross-region read replicas
- Extensions not in the following table of supported extensions

## PostgreSQL extensions supported in the preview environment

The PostgreSQL extensions supported in the Database Preview Environment are listed in the following table.

Extension	Version
amcheck	1.2
aws_commons	1.0
aws_s3	1.0

Extension	Version
bloom	1.0
btree_gin	1.3
btree_gist	1.5
citext	1.6
cube	1.4
dblink	1.2
dict_int	1.0
dict_xsyn	1.0
earthdistance	1.1
fuzzystrmatch	1.1
hstore	1.7
hstore_plper	1.0
intagg	1.1
intarray	1.3
ip4r	2.4
isn	1.2
jsonb_plperl	1.0
ltree	1.2
pageinspect	1.8
pg_buffercache	1.3
pg_freespacemap	1.2
pg_prewarm	1.2
pg_similarity	1.0
pg_stat_statements	1.8
pg_transport	1.0
pg_trgm	1.5
pg_visibility	1.2
pgcrypto	1.3
pgrouting	3.0.0
pgrowlocks	1.2
pgstattuple	1.5

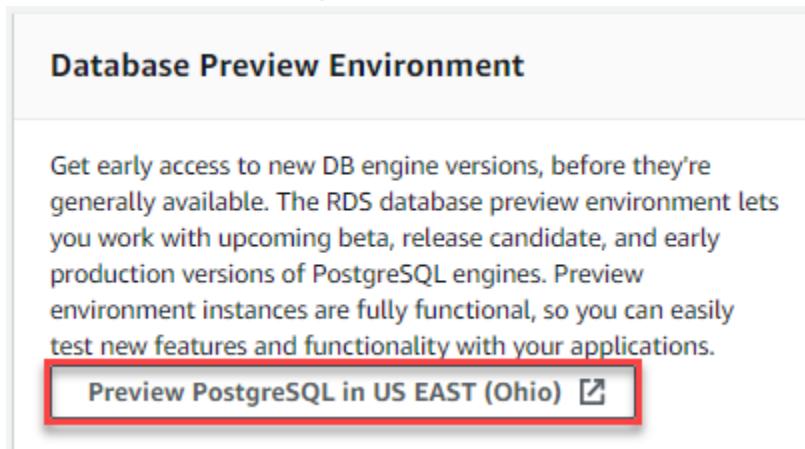

Extension	Version
pgtap	1.1.0
plperl	1.0
plpgsql	1.0
plprofiler	4.1
pltcl	1.0
postgres_fdw	1.0
prefix	1.2.0
sslinfo	1.2
tablefunc	1.0
test_parser	1.0
tsm_system_rows	1.0
tsm_system_time	1.0
unaccent	1.1
uuid-ossp	1.1

## Creating a new DB instance in the preview environment

Use the following procedure to create a DB instance in the preview environment.

### To create a DB instance in the preview environment

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. Choose **Dashboard** from the navigation pane.
3. Choose **Switch to database preview environment**.

You also can navigate directly to the [Database preview environment](#).

**Note**

If you want to create an instance in the Database Preview Environment with the API or CLI, the endpoint is `rds-preview.us-east-2.amazonaws.com`.

4. Continue with the procedure as described in [Console \(p. 140\)](#).

## Limitations for PostgreSQL DB instances

The following is a list of limitations for PostgreSQL on Amazon RDS:

- You can have up to 40 PostgreSQL DB instances.
- For storage limits, see [Amazon RDS DB instance storage \(p. 40\)](#).
- Amazon RDS reserves up to 3 connections for system maintenance. If you specify a value for the user connections parameter, you need to add 3 to the number of connections that you expect to use.

# Supported PostgreSQL database versions

Amazon RDS supports DB instances running several editions of PostgreSQL. You can specify any currently supported PostgreSQL version when creating a new DB instance. You can specify the major version (such as PostgreSQL 10), and any supported minor version for the specified major version. If no version is specified, Amazon RDS defaults to a supported version, typically the most recent version. If a major version is specified but a minor version is not, Amazon RDS defaults to a recent release of the major version you have specified.

To see a list of supported versions, as well as defaults for newly created DB instances, use the `describe-db-engine-versions` AWS CLI command. For example, to display the default PostgreSQL engine version, use the following command:

```
aws rds describe-db-engine-versions --default-only --engine postgres
```

## Topics

- [PostgreSQL 13 versions \(p. 1499\)](#)
- [PostgreSQL 12 versions \(p. 1500\)](#)
- [PostgreSQL 11 versions \(p. 1501\)](#)
- [PostgreSQL 10 versions \(p. 1504\)](#)
- [PostgreSQL 9.6 versions \(p. 1509\)](#)
- [PostgreSQL 9.5 versions \(p. 1514\)](#)

## PostgreSQL 13 versions

### Minor versions

- [PostgreSQL version 13.2 on Amazon RDS \(p. 1499\)](#)
- [PostgreSQL version 13.1 on Amazon RDS \(p. 1499\)](#)

## PostgreSQL version 13.2 on Amazon RDS

PostgreSQL version 13.2 is now available on Amazon RDS. PostgreSQL contains several improvements that were announced in [PostgreSQL 13.2](#).

This version also added the following new extensions:

1. The `aws_lambda` extension version 1.0. For more information, see [Invoking an AWS Lambda function from an RDS for PostgreSQL DB instance \(p. 1656\)](#).
2. The `pg_bigm` extension version 1.2.

For information on all extensions, see [PostgreSQL version 13 extensions supported on Amazon RDS \(p. 1521\)](#).

## PostgreSQL version 13.1 on Amazon RDS

PostgreSQL version 13.1 is now available on Amazon RDS. PostgreSQL contains several improvements that were announced in [PostgreSQL 13.0](#) and [PostgreSQL 13.1](#).

This version added the `bool_plperl` extension version 1.0.

For information on all extensions, see [PostgreSQL version 13 extensions supported on Amazon RDS \(p. 1521\)](#).

## PostgreSQL 12 versions

### Minor versions

- [PostgreSQL version 12.6 on Amazon RDS \(p. 1500\)](#)
- [PostgreSQL version 12.5 on Amazon RDS \(p. 1500\)](#)
- [PostgreSQL version 12.4 on Amazon RDS \(p. 1500\)](#)
- [PostgreSQL version 12.3 on Amazon RDS \(p. 1501\)](#)
- [PostgreSQL version 12.2 on Amazon RDS \(p. 1501\)](#)

## PostgreSQL version 12.6 on Amazon RDS

PostgreSQL version 12.6 is now available on Amazon RDS. PostgreSQL version 12.6 contains several improvements that were announced for PostgreSQL release [12.6](#).

This version also includes the following changes:

1. The `aws_lambda` extension version 1.0 is added. For more information, see [Invoking an AWS Lambda function from an RDS for PostgreSQL DB instance \(p. 1656\)](#).
2. The `pg_bigm` extension version 1.2 is added.
3. The [PostGIS \(p. 1642\)](#) extension is updated to version 3.0.2.

For information on all extensions, see [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#).

## PostgreSQL version 12.5 on Amazon RDS

PostgreSQL version 12.5 is now available on Amazon RDS. PostgreSQL version 12.5 contains several improvements that were announced for PostgreSQL release [12.5](#).

This version also includes the following changes:

1. Added the `pg_partman` extension version 4.4.0. For more information, see [Managing PostgreSQL partitions with the pg\\_partman extension \(p. 1652\)](#).
2. Added the `pg_cron` extension version 1.3.0. For more information, see [Scheduling maintenance with the PostgreSQL pg\\_cron extension \(p. 1645\)](#).

For information on all extensions, see [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#).

## PostgreSQL version 12.4 on Amazon RDS

PostgreSQL version 12.4 is now available on Amazon RDS. PostgreSQL version 12.4 contains several improvements that were announced for PostgreSQL release [12.4](#).

This version also includes the following changes:

1. Added the `pg_proctab` extension version 0.0.9
2. Added the `rdkit` extension version 3.8

3. Upgraded the `aws_s3` extension to version 1.1.
4. Upgraded the `pglogical` extension to version 2.3.2
5. Upgraded the `wal2json` extension to version 2.3

For information on all extensions, see [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#).

## PostgreSQL version 12.3 on Amazon RDS

PostgreSQL version 12.3 is now available on Amazon RDS. PostgreSQL version 12.3 contains several improvements that were announced for PostgreSQL release [12.3](#).

This version also includes the following changes:

1. Upgraded the `pg_hint_plan` extension to version 1.3.5.
2. Upgraded the `pglogical` extension to version 2.3.1.

For information on all extensions, see [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#).

## PostgreSQL version 12.2 on Amazon RDS

PostgreSQL version 12.2 is now available on Amazon RDS. PostgreSQL version 12.2 contains several improvements that were announced for PostgreSQL releases [12.0](#), [12.1](#), and [12.2](#).

For information on all extensions, see [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#).

## PostgreSQL 11 versions

### Minor versions

- [PostgreSQL version 11.11 on Amazon RDS \(p. 1501\)](#)
- [PostgreSQL version 11.10 on Amazon RDS \(p. 1502\)](#)
- [PostgreSQL version 11.9 on Amazon RDS \(p. 1502\)](#)
- [PostgreSQL version 11.8 on Amazon RDS \(p. 1502\)](#)
- [PostgreSQL version 11.7 on Amazon RDS \(p. 1502\)](#)
- [PostgreSQL version 11.6 on Amazon RDS \(p. 1502\)](#)
- [PostgreSQL version 11.5 on Amazon RDS \(p. 1503\)](#)
- [PostgreSQL version 11.4 on Amazon RDS \(p. 1503\)](#)
- [PostgreSQL version 11.2 on Amazon RDS \(p. 1503\)](#)
- [PostgreSQL version 11.1 on Amazon RDS \(p. 1503\)](#)

## PostgreSQL version 11.11 on Amazon RDS

PostgreSQL version 11.11 is now available on Amazon RDS. PostgreSQL version 11.11 contains several improvements that were announced for PostgreSQL release [11.11](#).

This version also added the following new extension:

1. The `pg_bigm` extension version 1.2.

For information on all extensions, see [PostgreSQL version 11.x extensions supported on Amazon RDS \(p. 1527\)](#).

## PostgreSQL version 11.10 on Amazon RDS

PostgreSQL version 11.10 is now available on Amazon RDS. PostgreSQL version 11.10 contains several improvements that were announced for PostgreSQL release [11.10](#).

For information on all extensions, see [PostgreSQL version 11.x extensions supported on Amazon RDS \(p. 1527\)](#).

## PostgreSQL version 11.9 on Amazon RDS

PostgreSQL version 11.9 is now available on Amazon RDS. PostgreSQL version 11.9 contains several improvements that were announced for PostgreSQL release [11.9](#).

This version also includes the following changes:

1. Added the `aws_s3` extension version 1.1
2. Added the `pg_proctab` extension version 0.0.9
3. Upgraded the `pgaudit` extension to version 1.3.1.
4. Upgraded the `pglogical` extension to version 2.2.2
5. Added the `rdkit` extension version 3.8

For information on all extensions, see [PostgreSQL version 11.x extensions supported on Amazon RDS \(p. 1527\)](#).

## PostgreSQL version 11.8 on Amazon RDS

PostgreSQL version 11.8 contains several bug fixes for issues in release 11.7. For more information on the fixes in PostgreSQL 11.8, see the [PostgreSQL 11.8 documentation](#).

This version also includes the following change:

1. Upgraded the `pg_hint_plan` extension to version 1.3.5.

For information on all extensions, see [PostgreSQL version 11.x extensions supported on Amazon RDS \(p. 1527\)](#).

## PostgreSQL version 11.7 on Amazon RDS

PostgreSQL version 11.7 contains several bug fixes for issues in release 11.6. For more information on the fixes in PostgreSQL 11.7, see the [PostgreSQL 11.7 documentation](#).

## PostgreSQL version 11.6 on Amazon RDS

PostgreSQL version 11.6 contains several bug fixes for issues in release 11.5. For more information on the fixes in PostgreSQL 11.6, see the [PostgreSQL documentation](#).

This version also includes the following changes:

1. Upgraded the `pgTAP` extension to version 1.1.0.
2. Added the `plprofiler` extension.

3. Added to `shared_preload_libraries` support for `pg_prewarm` to start automatically.

## PostgreSQL version 11.5 on Amazon RDS

PostgreSQL version 11.5 contains several bug fixes for issues in release 11.4. For more information on the fixes in PostgreSQL 11.5, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- A new extension `pg_transport` is added.
- The extension `aws_s3` has been updated to support virtual-hosted style requests. For more information, see [Amazon S3 path deprecation plan – The rest of the story](#).
- The `PostGIS` extension is updated to version 2.5.2.

## PostgreSQL version 11.4 on Amazon RDS

This release contains an important security fix and also bug fixes and improvements done by the PostgreSQL community. For more information on the security fix, see the [PostgreSQL community announcement](#) and the security fix CVE-2019-10164.

With this release, the `pg_hint_plan` extension has been updated to version 1.3.4.

For more information on the fixes in PostgreSQL 11.4, see the [PostgreSQL documentation](#).

## PostgreSQL version 11.2 on Amazon RDS

PostgreSQL version 11.2 contains several bug fixes for issues in release 11.1. For more information on the fixes in PostgreSQL 11.2, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- A new `pgTAP` extension version 1.0.
- Support for Amazon S3 import. For more information, see [Importing Amazon S3 data into an RDS for PostgreSQL DB instance \(p. 1590\)](#).
- Multiple major version upgrade is available to PostgreSQL 11.2 from certain previous PostgreSQL versions. For more information, see [Choosing a major version upgrade for PostgreSQL \(p. 1572\)](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 11.1 on Amazon RDS

PostgreSQL version 11.1 contains several improvements that were announced in [PostgreSQL 11.1 released!](#) This version includes SQL stored procedures that enable embedded transactions within a procedure. This version also includes major improvements to partitioning and parallelism and many useful performance improvements. For example, by using a non-null constant for a column default, you can now use an `ALTER TABLE` command to add a column without causing a table rewrite.

PostgreSQL version 11.1 contains several bug fixes for issues in release 11. For complete details, see the [PostgreSQL release 11.1 documentation](#). Some changes in this version include the following:

- Partitioning – Partitioning improvements include support for hash partitioning, enabling creation of a default partition, and dynamic row movement to another partition based on the key column update.
- Performance – Performance improvements include parallelism while creating indexes, materialized views, hash joins, and sequential scans to make the operations perform better.
- Stored procedures – SQL stored procedures now added support embedded transactions.
- Support for Just-In-Time (JIT) capability – RDS for PostgreSQL 11 instances are created with JIT capability, speeding evaluation of expressions. To enable JIT capability, set the `jit` parameter to 1 in the PostgreSQL parameter group for the database.
- Segment size – The write-ahead logging (WAL) segment size has been changed from 16 MB to 64 MB.
- Autovacuum improvements – To provide valuable logging, the parameter `rds.force_autovacuum_logging` is ON by default in conjunction with the `log_autovacuum_min_duration` parameter set to 10 seconds. To increase autovacuum effectiveness, the values for the `autovacuum_max_workers` and `autovacuum_vacuum_cost_limit` parameters are computed based on host memory capacity to provide larger default values.
- Improved transaction timeout – The parameter `idle_in_transaction_session_timeout` is set to 12 hours. Any session that has been idle more than 12 hours is terminated.
- Performance metrics – The `pg_stat_statements` extension is included in `shared_preload_libraries` by default. This avoids having to reboot the instance immediately after creation. However, this functionality still requires you to run the statement `CREATE EXTENSION pg_stat_statements;`. Also, `track_io_timing` is enabled by default to add more granular data to `pg_stat_statements`.
- The `tsearch2` extension is no longer supported – If your application uses `tsearch2` functions, update it to use the equivalent functions provided by the core PostgreSQL engine. For more information about the `tsearch2` extension, see [PostgreSQL tsearch2](#).
- The `chkpass` extension is no longer supported – For more information about the `chkpass` extension, see [PostgreSQL chkpass](#).
- Extension updates for RDS for PostgreSQL 11.1 include the following:
  - `pgaudit` is updated to 1.3.0.
  - `pg_hint_plan` is updated to 1.3.2.
  - `pglogical` is updated to 2.2.1.
  - `plcoffee` is updated to 2.3.8.
  - `plv8` is updated to 2.3.8.
  - `PostGIS` is updated to 2.5.1.
  - `prefix` is updated to 1.2.8.
  - `wal2json` is updated to hash 9e962bad.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL 10 versions

### Minor versions

- [PostgreSQL version 10.16 on Amazon RDS \(p. 1505\)](#)
- [PostgreSQL version 10.15 on Amazon RDS \(p. 1505\)](#)
- [PostgreSQL version 10.14 on Amazon RDS \(p. 1505\)](#)
- [PostgreSQL version 10.13 on Amazon RDS \(p. 1505\)](#)
- [PostgreSQL version 10.12 on Amazon RDS \(p. 1506\)](#)
- [PostgreSQL version 10.11 on Amazon RDS \(p. 1506\)](#)

- [PostgreSQL version 10.10 on Amazon RDS \(p. 1506\)](#)
- [PostgreSQL version 10.9 on Amazon RDS \(p. 1506\)](#)
- [PostgreSQL version 10.7 on Amazon RDS \(p. 1506\)](#)
- [PostgreSQL version 10.6 on Amazon RDS \(p. 1506\)](#)
- [PostgreSQL version 10.5 on Amazon RDS \(p. 1507\)](#)
- [PostgreSQL version 10.4 on Amazon RDS \(p. 1507\)](#)
- [PostgreSQL version 10.3 on Amazon RDS \(p. 1508\)](#)
- [PostgreSQL version 10.1 on Amazon RDS \(p. 1508\)](#)

## PostgreSQL version 10.16 on Amazon RDS

PostgreSQL version 10.16 is now available on Amazon RDS. PostgreSQL version 10.16 contains several improvements that were announced for PostgreSQL release [10.16](#).

For information on all extensions, see [PostgreSQL version 10.x extensions supported on Amazon RDS \(p. 1529\)](#).

## PostgreSQL version 10.15 on Amazon RDS

PostgreSQL version 10.15 is now available on Amazon RDS. PostgreSQL version 10.15 contains several improvements that were announced for PostgreSQL release [10.15](#).

For information on all extensions, see [PostgreSQL version 10.x extensions supported on Amazon RDS \(p. 1529\)](#).

## PostgreSQL version 10.14 on Amazon RDS

PostgreSQL version 10.14 is now available on Amazon RDS. PostgreSQL version 10.14 contains several improvements that were announced for PostgreSQL release [10.14](#).

This version also includes the following changes:

1. Added the `aws_s3` extension version 1.1. For more information, see [Exporting data from an RDS for PostgreSQL DB instance to Amazon S3 \(p. 1606\)](#).
2. Upgraded the `pgaudit` extension to version 1.2.1
3. Upgraded the `pglogical` extension to version 2.2.2
4. Upgraded the `wal2json` extension to version 2.3

For information on all extensions, see [PostgreSQL version 10.x extensions supported on Amazon RDS \(p. 1529\)](#).

## PostgreSQL version 10.13 on Amazon RDS

PostgreSQL version 10.13 contains several bug fixes for issues in release 10.12. For more information on the fixes in PostgreSQL 10.13, see the [PostgreSQL 10.13 documentation](#).

This version also includes the following change:

1. Upgraded the `pg_hint_plan` extension to version 1.3.5.

For information on all extensions, see [PostgreSQL version 10.x extensions supported on Amazon RDS \(p. 1529\)](#).

## PostgreSQL version 10.12 on Amazon RDS

PostgreSQL version 10.12 contains several bug fixes for issues in release 10.11. For more information on the fixes in PostgreSQL 10.12, see the [PostgreSQL 10.12 documentation](#).

## PostgreSQL version 10.11 on Amazon RDS

PostgreSQL version 10.11 contains several bug fixes for issues in release 10.10. For more information on the fixes in PostgreSQL 10.11, see the [PostgreSQL documentation](#). Changes in this version include the following:

1. Added the `plprofiler` extension.

## PostgreSQL version 10.10 on Amazon RDS

PostgreSQL version 10.10 contains several bug fixes for issues in release 10.9. For more information on the fixes in PostgreSQL 10.10, see the [PostgreSQL documentation](#). Changes in this version include the following:

1. The `aws_s3` extension is updated to support virtual-hosted style requests. For more information, see [Amazon S3 path deprecation plan – The rest of the story](#).
2. The `PostGIS` extension is updated to version 2.5.2.

## PostgreSQL version 10.9 on Amazon RDS

This release contains an important security fix and also bug fixes and improvements done by the PostgreSQL community. For more information on the security fix, see the [PostgreSQL community announcement and security fix CVE-2019-10164](#).

With this release, the `pg_hint_plan` extension has been updated to version 1.3.3.

For more information on the fixes in PostgreSQL 10.9, see the [PostgreSQL documentation](#).

## PostgreSQL version 10.7 on Amazon RDS

PostgreSQL version 10.7 contains several bug fixes for issues in release 10.6. For more information on the fixes in 10.7, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- Support for Amazon S3 import. For more information, see [Importing Amazon S3 data into an RDS for PostgreSQL DB instance \(p. 1590\)](#).
- Multiple major version upgrade is available to PostgreSQL 10.7 from certain previous PostgreSQL versions. For more information, see [Choosing a major version upgrade for PostgreSQL \(p. 1572\)](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 10.6 on Amazon RDS

PostgreSQL version 10.6 contains several bug fixes for issues in release 10.5. For more information on the fixes in PostgreSQL 10.6, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- A new `rds.restrict_password_commands` parameter and a new `rds_password` role have been introduced. When the `rds.restrict_password_commands` parameter is enabled, only users who have the `rds_password` role can make user password and password expiration changes. By restricting password-related operations to a limited set of roles, you can implement policies such as password complexity requirements from the client side. The `rds.restrict_password_commands` parameter is static, so it requires a database restart to change it. For more information, see [Restricting password management \(p. 1631\)](#).
- The logical decoding plugin `wal2json` has been updated to commit `9e962ba`.

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

**Note**

Amazon RDS for PostgreSQL has announced the removal of the `tsearch2` extension in the next major release. We encourage customers still using pre-8.3 text search to migrate to the equivalent built-in features. For more information about migrating, see the [PostgreSQL documentation](#).

## PostgreSQL version 10.5 on Amazon RDS

PostgreSQL version 10.5 contains several bug fixes for issues in release 10.4. For more information on the fixes in 10.5, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- Support for the `pglogical` extension version 2.2.0. Prerequisites for using this extension are the same as the prerequisites for using logical replication for PostgreSQL as described in [Logical replication for PostgreSQL on Amazon RDS \(p. 1540\)](#).
- Support for the `pg_similarity` extension version 1.0.
- Support for the `pageinspect` extension version 1.6.
- Support for the `libprotobuf` extension version 1.3.0 for the PostGIS component.
- An update for the `pg_hint_plan` extension to version 1.3.1.
- An update for the `wal2json` extension to version `01c5c1e`.

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 10.4 on Amazon RDS

PostgreSQL version 10.4 contains several bug fixes for issues in release 10.3. For more information on the fixes in 10.4, see the [PostgreSQL documentation](#).

This version also includes the following changes:

- Support for PostgreSQL 10 Logical Replication using the native publication and subscription framework. RDS for PostgreSQL databases can function as both publishers and subscribers. You can specify replication to other PostgreSQL databases at the database-level or at the table-level. With

logical replication, the publisher and subscriber databases need not be physically identical (block-to-block) to each other. This allows for use cases such as data consolidation, data distribution, and data replication across different database versions for 10.4 and above. For more details, refer to [Logical replication for PostgreSQL on Amazon RDS \(p. 1540\)](#).

- The temporary file size limitation is user-configurable. You require the `rds_superuser` role to modify the `temp_file_limit` parameter.
- Update of the `GDAL` library, which is used by the PostGIS extension. See [Working with the PostGIS extension \(p. 1640\)](#).
- Update of the `ip4r` extension to version 2.1.1.
- Update of the `pg_repack` extension to version 1.4.3. See [Working with the pg\\_repack extension \(p. 1628\)](#).
- Update of the `plv8` extension to version 2.1.2.

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

**Note**

The `tsearch2` extension is to be removed in the next major release. We encourage customers still using pre-8.3 text search to migrate to the equivalent built-in features. For more information about migrating, see the [PostgreSQL documentation](#).

## PostgreSQL version 10.3 on Amazon RDS

PostgreSQL version 10.3 contains several bug fixes for issues in release 10. For more information on the fixes in 10.3, see the [PostgreSQL documentation](#).

Version 2.1.0 of `plv8` is now available. If you use `plv8` and upgrade PostgreSQL to a new `plv8` version, you immediately take advantage of the new extension but the catalog metadata doesn't reflect this fact. For the steps to synchronize your catalog metadata with the new version of `plv8`, see [Upgrading plv8 \(p. 1538\)](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 10.1 on Amazon RDS

PostgreSQL version 10.1 contains several bug fixes for issues in release 10. For more information on the fixes in 10.1, see the [PostgreSQL documentation](#) and the [PostgreSQL 10 community announcement](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

PostgreSQL version 10.1 includes the following changes:

- **Declarative table partitioning** – PostgreSQL 10 adds table partitioning to SQL syntax and native tuple routing.
- **Parallel queries** – When you create a new PostgreSQL 10.1 instance, parallel queries are enabled for the `default.postgres10` parameter group. The parameter `max_parallel_workers_per_gather` is set to 2 by default, but you can modify it to support your specific workload requirements.

- **Support for the international components for unicode (ICU)** – You can use the ICU library to provide explicitly versioned collations. Amazon RDS for PostgreSQL 10.1 is compiled with ICU version 60.2. For more information about ICU implementation in PostgreSQL, see [Collation support](#).
- **Huge pages** – Huge pages is a feature of the Linux kernel that uses multiple page size capabilities of modern hardware architectures. Amazon RDS for PostgreSQL supports huge pages with a global configuration parameter. When you create a new PostgreSQL 10.1 instance with RDS, the `huge_pages` parameter is set to "on" for the `default.postgres10` parameter group. You can modify this setting to support your specific workload requirements.
- Extension **plv8 update** – plv8 is a procedural language that you can use to write functions in JavaScript that you can then call from SQL. This release of PostgreSQL supports version 2.1.0 of plv8.
- **Renaming of xlog and location** – In PostgreSQL version 10 the abbreviation "xlog" has changed to "wal", and the term "location" has changed to "lsn". For more information, see <https://www.postgresql.org/docs/10/static/release-10.html#id-1.11.6.8.4>.
- **tsearch2 extension** – Amazon RDS continues to provide the `tsearch2` extension in PostgreSQL version 10, but is to remove it in the next major version release. If your application uses `tsearch2` functions update it to use the equivalent functions the core engine provides. For more information see [tsearch2](#) in the PostgreSQL documentation.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL 9.6 versions

### Minor versions

- [PostgreSQL version 9.6.21 on Amazon RDS \(p. 1509\)](#)
- [PostgreSQL version 9.6.20 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.19 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.18 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.17 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.16 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.15 on Amazon RDS \(p. 1510\)](#)
- [PostgreSQL version 9.6.14 on Amazon RDS \(p. 1511\)](#)
- [PostgreSQL version 9.6.12 on Amazon RDS \(p. 1511\)](#)
- [PostgreSQL version 9.6.11 on Amazon RDS \(p. 1511\)](#)
- [PostgreSQL version 9.6.10 on Amazon RDS \(p. 1511\)](#)
- [PostgreSQL version 9.6.9 on Amazon RDS \(p. 1511\)](#)
- [PostgreSQL version 9.6.8 on Amazon RDS \(p. 1512\)](#)
- [PostgreSQL version 9.6.6 on Amazon RDS \(p. 1512\)](#)
- [PostgreSQL version 9.6.5 on Amazon RDS \(p. 1512\)](#)
- [PostgreSQL version 9.6.3 on Amazon RDS \(p. 1513\)](#)
- [PostgreSQL version 9.6.2 on Amazon RDS \(p. 1513\)](#)
- [PostgreSQL version 9.6.1 on Amazon RDS \(p. 1513\)](#)

## PostgreSQL version 9.6.21 on Amazon RDS

PostgreSQL version 9.6.21 is now available on Amazon RDS. PostgreSQL version 9.6.21 contains several improvements that were announced for PostgreSQL release [9.6.21](#).

For information on all extensions, see [PostgreSQL version 9.6.x extensions supported on Amazon RDS \(p. 1532\)](#).

## PostgreSQL version 9.6.20 on Amazon RDS

PostgreSQL version 9.6.20 is now available on Amazon RDS. PostgreSQL version 9.6.20 contains several improvements that were announced for PostgreSQL release [9.6.20](#).

For information on all extensions, see [PostgreSQL version 9.6.x extensions supported on Amazon RDS \(p. 1532\)](#).

## PostgreSQL version 9.6.19 on Amazon RDS

PostgreSQL version 9.6.19 is now available on Amazon RDS. PostgreSQL version 9.6.19 contains several improvements that were announced for PostgreSQL release [9.6.19](#).

This version also includes the following changes:

1. Upgraded the `pgaudit` extension to version 1.1.2
2. Upgraded the `pglogical` extension to version 2.2.2
3. Upgraded the `wal2json` extension to version 2.3

For information on all extensions, see [PostgreSQL version 9.6.x extensions supported on Amazon RDS \(p. 1532\)](#).

## PostgreSQL version 9.6.18 on Amazon RDS

PostgreSQL version 9.6.18 contains several bug fixes for issues in release 9.6.17. For more information on the fixes in PostgreSQL 9.6.18, see the [PostgreSQL 9.6.18 documentation](#).

This version also includes the following change:

1. Upgraded the `pg_hint_plan` extension to version 1.2.6.

For information on all extensions, see [PostgreSQL version 9.6.x extensions supported on Amazon RDS \(p. 1532\)](#).

## PostgreSQL version 9.6.17 on Amazon RDS

PostgreSQL version 9.6.17 contains several bug fixes for issues in release 9.6.16. For more information on the fixes in PostgreSQL 9.6.17, see the [PostgreSQL 9.6.17 documentation](#).

## PostgreSQL version 9.6.16 on Amazon RDS

PostgreSQL version 9.6.16 contains several bug fixes for issues in release 9.6.15. For more information on the fixes in PostgreSQL 9.6.16, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.6.15 on Amazon RDS

PostgreSQL version 9.6.15 contains several bug fixes for issues in release 9.6.14. For more information on the fixes in PostgreSQL 9.6.15, see the [PostgreSQL documentation](#).

The `PostGIS` extension is updated to version 2.5.2.

## PostgreSQL version 9.6.14 on Amazon RDS

This release contains bug fixes and improvements done by the PostgreSQL community.

With this release, the `pg_hint_plan` extension has been updated to version 1.2.5.

For more information on the fixes in PostgreSQL 9.6.14, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.6.12 on Amazon RDS

PostgreSQL version 9.6.12 contains several bug fixes for issues in release 9.6.11. For more information on the fixes in 9.6.12, see the [PostgreSQL documentation](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 9.6.11 on Amazon RDS

PostgreSQL version 9.6.11 contains several bug fixes for issues in release 9.6.10. For more information on the fixes in PostgreSQL 9.6.11, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

With this version, the logical decoding plugin `wal2json` has been updated to commit 9e962ba.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.10 on Amazon RDS

PostgreSQL version 9.6.10 contains several bug fixes for issues in release 9.6.9. For more information on the fixes in 9.6.10, see the [PostgreSQL documentation](#).

This version includes the following changes:

- Support for the `pglogical` extension version 2.2.0. Prerequisites for using this extension are the same as the prerequisites for using logical replication for PostgreSQL as described in [Logical replication for PostgreSQL on Amazon RDS \(p. 1540\)](#).
- Support for the `pg_similarity` extension version 2.2.0.
- An update for the `wal2json` extension to version 01c5c1e.
- An update for the `pg_hint_plan` extension to version 1.2.3.

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.9 on Amazon RDS

PostgreSQL version 9.6.9 contains several bug fixes for issues in release 9.6.8. For more information on the fixes in 9.6.9, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

This version includes the following changes:

- The temporary file size limitation is user-configurable. You require the **rds\_superuser** role to modify the `temp_file_limit` parameter.
  - Update of the `GDAL` library, which is used by the PostGIS extension. See [Working with the PostGIS extension \(p. 1640\)](#).
  - Update of the `ip4r` extension to version 2.1.1.
  - Update of the `pgaudit` extension to version 1.1.1. See [Working with the pgaudit extension \(p. 1626\)](#).
- Update of the `pg_repack` extension to version 1.4.3. See [Working with the pg\\_repack extension \(p. 1628\)](#).
- Update of the `plv8` extension to version 2.1.2.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.8 on Amazon RDS

PostgreSQL version 9.6.8 contains several bug fixes for issues in release 9.6.6. For more information on the fixes in 9.6.8, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.6 on Amazon RDS

PostgreSQL version 9.6.6 contains several bug fixes for issues in release 9.6.5. For more information on the fixes in 9.6.6, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

This version includes the following features:

- Supports the `orafce` extension, version 3.6.1. This extension contains functions that are native to commercial databases, and can be helpful if you are porting a commercial database to PostgreSQL. For more information about using `orafce` with Amazon RDS, see [Working with the orafce extension \(p. 1629\)](#).
- Supports the `prefix` extension, version 1.2.6. This extension provides an operator for text prefix searches. For more information about `prefix`, see the [prefix project on GitHub](#).
- Supports version 2.3.4 of PostGIS, version 2.4.2 of pgrouting, and an updated version of wal2json.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.5 on Amazon RDS

PostgreSQL version 9.6.5 contains several bug fixes for issues in release 9.6.4. For more information on the fixes in 9.6.5, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

This version also includes support for the `pgrouting`, `postgresql-hll` extensions, and the `decoder_raw` optional extension.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.6.3 on Amazon RDS

PostgreSQL version 9.6.3 contains several new features and bug fixes. This version includes the following features:

- Supports the extension `pg_repack` version 1.4.0. You can use this extension to remove bloat from tables and indexes. For more information on using `pg_repack` with Amazon RDS, see [Working with the pg\\_repack extension \(p. 1628\)](#).
- Supports the extension `pgaudit` version 1.1.0. This extension provides detailed session and object audit logging. For more information on using `pgaudit` with Amazon RDS, see [Working with the pgaudit extension \(p. 1626\)](#).
- Supports `wal2json`, an output plugin for logical decoding.
- Supports the `auto_explain` extension. You can use this extension to log execution plans of slow statements automatically. The following example shows how to use `auto_explain` from within an Amazon RDS PostgreSQL session:

```
LOAD '$libdir/plugins/auto_explain';
```

For more information on using `auto_explain`, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.6.2 on Amazon RDS

PostgreSQL version 9.6.2 contains several new features and bug fixes. The new version also includes the following extension versions:

- PostGIS version 2.3.2
- `pg_freespacemap` version 1.1—Provides a way to examine the free space map (FSM). This extension provides an overloaded function called `pg_freespace`. The functions show the value recorded in the free space map for a given page, or for all pages in the relation.
- `pg_hint_plan` version 1.1.3—Provides control of execution plans by using hinting phrases at the beginning of SQL statements.
- `log_fdw` version 1.0—Using this extension from Amazon RDS, you can load and query your database engine log from within the database. For more information, see [Using the log\\_fdw extension \(p. 1537\)](#).
- With this version release, you can now edit the `max_worker_processes` parameter in a DB parameter group.

PostgreSQL version 9.6.2 on Amazon RDS also supports altering enum values. For more information, see [ALTER ENUM for PostgreSQL \(p. 1544\)](#).

For more information on the fixes in 9.6.2, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 9.6.1 on Amazon RDS

PostgreSQL version 9.6.1 contains several new features and improvements. For more information about the fixes and improvements in PostgreSQL 9.6.1, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#). For information about performing parallel queries and phrase searching using Amazon RDS for PostgreSQL 9.6.1, see the [AWS database blog](#).

PostgreSQL version 9.6.1 includes the following changes:

- **Parallel query processing:** Supports parallel processing of large read-only queries, allowing sequential scans, hash joins, nested loops, and aggregates to be run in parallel. By default, parallel query processing is not enabled. To enable parallel query processing, set the parameter `max_parallel_workers_per_gather` to a value larger than zero.
- **Updated `postgres_fdw` extension:** Supports remote JOINs, SORTs, UPDATEs, and DELETE operations.
- **plv8 update:** Provides version 1.5.3 of the plv8 language.
- **PostGIS version update:** Supports POSTGIS="2.3.0 r15146" GEOS="3.5.0-CAPI-1.9.0 r4084" PROJ="Rel. 4.9.2, 08 September 2015" GDAL="GDAL 2.1.1, released 2016/07/07" LIBXML="2.9.1" LIBJSON="0.12" RASTER
- **Vacuum improvement:** Avoids scanning pages unnecessarily during vacuum freeze operations.
- **Full-text search support for phrases:** Supports the ability to specify a phrase-search query in `tsquery` input using the new operators `<>` and `<N>`.
- **Two new extensions are supported:**
  - `bloom`, an index access method based on [Bloom filters](#)
  - `pg_visibility`, which provides a means for examining the visibility map and page-level visibility information of a table.
- With the release of version 9.6.2, you can now edit the `max_worker_processes` parameter in a PostgreSQL version 9.6.1 DB parameter group.

You can create a new PostgreSQL 9.6.1 database instance using the AWS Management Console, AWS CLI, or RDS API. You can also upgrade an existing PostgreSQL 9.5 instance to version 9.6.1 using major version upgrade. If you want to upgrade a DB instance from version 9.4 to 9.6, you must perform a point-and-click upgrade to the next major version first. Each upgrade operation involves a short period of unavailability for your DB instance.

## PostgreSQL 9.5 versions

### Minor versions

- [PostgreSQL version 9.5.25 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.24 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.23 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.22 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.21 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.20 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.19 on Amazon RDS \(p. 1515\)](#)
- [PostgreSQL version 9.5.18 on Amazon RDS \(p. 1516\)](#)
- [PostgreSQL version 9.5.16 on Amazon RDS \(p. 1516\)](#)
- [PostgreSQL version 9.5.15 on Amazon RDS \(p. 1516\)](#)
- [PostgreSQL version 9.5.14 on Amazon RDS \(p. 1516\)](#)
- [PostgreSQL version 9.5.13 on Amazon RDS \(p. 1516\)](#)
- [PostgreSQL version 9.5.12 on Amazon RDS \(p. 1517\)](#)
- [PostgreSQL version 9.5.10 on Amazon RDS \(p. 1517\)](#)
- [PostgreSQL version 9.5.9 on Amazon RDS \(p. 1517\)](#)
- [PostgreSQL version 9.5.7 on Amazon RDS \(p. 1517\)](#)

- [PostgreSQL version 9.5.6 on Amazon RDS \(p. 1517\)](#)
- [PostgreSQL version 9.5.4 on Amazon RDS \(p. 1518\)](#)
- [PostgreSQL version 9.5.2 on Amazon RDS \(p. 1518\)](#)

## PostgreSQL version 9.5.25 on Amazon RDS

PostgreSQL version 9.5.25 is now available on Amazon RDS. PostgreSQL version 9.5.25 contains several improvements that were announced for PostgreSQL release [9.5.25](#).

For information on all extensions, see [PostgreSQL version 9.5.x extensions supported on Amazon RDS \(p. 1534\)](#).

## PostgreSQL version 9.5.24 on Amazon RDS

PostgreSQL version 9.5.24 is now available on Amazon RDS. PostgreSQL version 9.5.24 contains several improvements that were announced for PostgreSQL release [9.5.24](#).

For information on all extensions, see [PostgreSQL version 9.5.x extensions supported on Amazon RDS \(p. 1534\)](#).

## PostgreSQL version 9.5.23 on Amazon RDS

PostgreSQL version 9.5.23 is now available on Amazon RDS. PostgreSQL version 9.5.23 contains several improvements that were announced for PostgreSQL release [9.5.23](#).

For information on all extensions, see [PostgreSQL version 9.5.x extensions supported on Amazon RDS \(p. 1534\)](#).

## PostgreSQL version 9.5.22 on Amazon RDS

PostgreSQL version 9.5.22 contains several bug fixes for issues in release 9.5.21. For more information on the fixes in PostgreSQL 9.5.22, see the [PostgreSQL 9.5.22 documentation](#).

This version also includes the following change:

1. Upgraded the `pg_hint_plan` extension to version 1.1.9.

For information on all extensions, see [PostgreSQL version 9.5.x extensions supported on Amazon RDS \(p. 1534\)](#).

## PostgreSQL version 9.5.21 on Amazon RDS

PostgreSQL version 9.5.21 contains several bug fixes for issues in release 9.5.20. For more information on the fixes in PostgreSQL 9.5.21, see the [PostgreSQL 9.5.21 documentation](#).

## PostgreSQL version 9.5.20 on Amazon RDS

PostgreSQL version 9.5.20 contains several bug fixes for issues in release 9.5.19. For more information on the fixes in PostgreSQL 9.5.20, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.5.19 on Amazon RDS

PostgreSQL version 9.5.19 contains several bug fixes for issues in release 9.5.18. For more information on the fixes in PostgreSQL 9.5.19, see the [PostgreSQL documentation](#).

The PostGIS extension is updated to version 2.5.2.

## PostgreSQL version 9.5.18 on Amazon RDS

This release contains bug fixes and improvements done by the PostgreSQL community.

With this release, the `pg_hint_plan` extension has been updated to version 1.1.8.

For more information on the fixes in PostgreSQL 9.5.18, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.5.16 on Amazon RDS

PostgreSQL version 9.5.16 contains several bug fixes for issues in release 9.5.15. For more information on the fixes in 9.5.16, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.5.15 on Amazon RDS

PostgreSQL version 9.5.15 contains several bug fixes for issues in release 9.5.14. For more information on the fixes in 9.5.15, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.5.14 on Amazon RDS

PostgreSQL version 9.5.14 contains several bug fixes for issues in release 9.5.13. For more information on the fixes in 9.5.14, see the [PostgreSQL documentation](#).

For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.5.13 on Amazon RDS

PostgreSQL version 9.5.13 contains several bug fixes for issues in release 9.5.12. For more information on the fixes in 9.5.13, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

This version includes the following extension updates:

- Update of the `pgaudit` extension to version 1.0.6. See [Working with the pgaudit extension \(p. 1626\)](#).
- Update of the `pg_hint_plan` extension to version 1.1.5.
- Update of the `plv8` extension to version 2.1.2.

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.5.12 on Amazon RDS

PostgreSQL version 9.5.12 contains several bug fixes for issues in release 9.5.10. For more information on the fixes in 9.5.12, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

For the complete list of extensions supported by Amazon RDS for PostgreSQL, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

## PostgreSQL version 9.5.10 on Amazon RDS

PostgreSQL version 9.5.10 contains several bug fixes for issues in version 9.5.9. For more information on the fixes in 9.5.10, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 9.5.9 on Amazon RDS

PostgreSQL version 9.5.9 contains several bug fixes for issues in version 9.5.8. For more information on the fixes in 9.5.9, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 9.5.7 on Amazon RDS

PostgreSQL version 9.5.7 contains several new features and bug fixes. This version includes the following features:

- Supports the extension `pgaudit` version 1.0.5. This extension provides detailed session and object audit logging. For more information on using `pgaudit` with Amazon RDS, see [Working with the pgaudit extension \(p. 1626\)](#).
- Supports `wal2json`, an output plugin for logical decoding.
- Supports the `auto_explain` extension. You can use this extension to log execution plans of slow statements automatically. The following example shows how to use `auto_explain` from within an Amazon RDS PostgreSQL session.

```
LOAD '$libdir/plugins/auto_explain';
```

For more information on using `auto_explain`, see the [PostgreSQL documentation](#).

## PostgreSQL version 9.5.6 on Amazon RDS

PostgreSQL version 9.5.6 contains several new features and bug fixes. The new version also includes the following extension versions:

- PostGIS version 2.2.5
- `pg_freespacemap` version 1.1—Provides a way to examine the free space map (FSM). This extension provides an overloaded function called `pg_freespace`. This function shows the value recorded in the free space map for a given page, or for all pages in the relation.
- `pg_hint_plan` version 1.1.3—Provides control of execution plans by using hinting phrases at the beginning of SQL statements.

PostgreSQL version 9.5.6 on Amazon RDS also supports altering enum values. For more information, see [ALTER ENUM for PostgreSQL \(p. 1544\)](#).

For more information on the fixes in 9.5.6, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

## PostgreSQL version 9.5.4 on Amazon RDS

PostgreSQL version 9.5.4 contains several fixes to issues found in previous versions. For more information on the fixes in 9.5.4, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

PostgreSQL supports the streaming of WAL changes using logical replication decoding. Amazon RDS supports logical replication for PostgreSQL version 9.5.4 and higher. For more information about PostgreSQL logical replication on Amazon RDS, see [Logical replication for PostgreSQL on Amazon RDS \(p. 1540\)](#).

Beginning with PostgreSQL version 9.5.4 for Amazon RDS, the command ALTER USER WITH BYPASSRLS is supported.

PostgreSQL versions 9.5.4 and later support event triggers, and Amazon RDS supports event triggers for these versions. You can use the master user account to create, modify, rename, and delete event triggers. Event triggers are at the DB instance level, so they can apply to all databases on an instance. For more information about PostgreSQL event triggers on Amazon RDS, see [Event triggers for PostgreSQL on Amazon RDS \(p. 1542\)](#).

## PostgreSQL version 9.5.2 on Amazon RDS

PostgreSQL version 9.5.2 contains several fixes to issues found in previous versions. For more information on the features in 9.5.2, see the [PostgreSQL documentation](#). For information on upgrading the engine version for your PostgreSQL DB instance, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#).

PostgreSQL version 9.5.2 doesn't support the db.m1 or db.m2 DB instance classes. If you need to upgrade a DB instance running PostgreSQL version 9.4 to version 9.5.2 to one of these instance classes, you need to scale compute. To do that, you need a comparable db.t2 or db.m3 DB instance class before you can upgrade a DB instance running PostgreSQL version 9.4 to version 9.5.2. For more information on DB instance classes, see [DB instance classes \(p. 7\)](#).

Native PostgreSQL version 9.5.2 introduced the command ALTER USER WITH BYPASSRLS.

This release includes updates from previous versions, including the following:

- **CVE-2016-2193:** Fixes an issue where a query plan might be reused for more than one ROLE in the same session. Reusing a query plan can cause the query to use the wrong set of Row Level Security (RLS) policies.
- **CVE-2016-3065:** Fixes a server crash bug triggered by using pageinspect with BRIN index pages. Because an attacker might be able to expose a few bytes of server memory, this crash is being treated as a security issue.

Major enhancements in RDS for PostgreSQL 9.5 include the following:

- **UPSERT:** Allow INSERTs that would generate constraint conflicts to be turned into UPDATEs or ignored
- Add the GROUP BY analysis features GROUPING SETS, CUBE, and ROLLUP
- Add row-level security control
- Create mechanisms for tracking the progress of replication, including methods for identifying the origin of individual changes during logical replication

- Add Block Range Indexes (BRIN)
- Add substantial performance improvements for sorting
- Add substantial performance improvements for multi-CPU machines
- PostGIS 2.2.2 - To use this latest version of PostGIS, use the ALTER EXTENSION UPDATE statement to update after you upgrade to version 9.5.2. Example:  

```
ALTER EXTENSION POSTGIS UPDATE TO '2.2.2'
```
- Improved visibility of autovacuum sessions by allowing the rds\_superuser account to view autovacuum sessions in pg\_stat\_activity. For example, you can identify and terminate an autovacuum session that is blocking a command from running, or running slower than a manually issued vacuum command.

RDS for PostgreSQL version 9.5.2 includes the following new extensions:

- **address\_standardizer** – A single-line address parser that takes an input address and normalizes it based on a set of rules stored in a table, helper lex, and gaz tables.
- **hstore\_plperl** – Provides transforms for the `hstore` type for PL/Perl.
- **tsm\_system\_rows** – Provides the table sampling method `SYSTEM_ROWS`, which can be used in the `TABLESAMPLE` clause of a `SELECT` command.
- **tsm\_system\_time** – Provides the table sampling method `SYSTEM_TIME`, which can be used in the `TABLESAMPLE` clause of a `SELECT` command.

# PostgreSQL extensions supported on Amazon RDS

RDS for PostgreSQL supports many PostgreSQL extensions. The PostgreSQL community sometimes refers to these as modules. Extensions expand on the functionality provided by the PostgreSQL engine. You can find a list of extensions supported by Amazon RDS in the default DB parameter group for that PostgreSQL version. You can also see the current extensions list using `psql` by showing the `rds.extensions` parameter as in the following example.

```
SHOW rds.extensions;
```

## Note

Parameters added in a minor version release might display inaccurately when using the `rds.extensions` parameter in `psql`.

The following sections show the extensions supported by Amazon RDS for the major PostgreSQL versions.

## Contents

- [Restricting installation of PostgreSQL extensions \(p. 1520\)](#)
- [PostgreSQL version 13 extensions supported on Amazon RDS \(p. 1521\)](#)
  - [PostgreSQL trusted extensions \(p. 1523\)](#)
- [PostgreSQL version 12 extensions supported on Amazon RDS \(p. 1524\)](#)
- [PostgreSQL version 11.x extensions supported on Amazon RDS \(p. 1527\)](#)
- [PostgreSQL version 10.x extensions supported on Amazon RDS \(p. 1529\)](#)
- [PostgreSQL version 9.6.x extensions supported on Amazon RDS \(p. 1532\)](#)
- [PostgreSQL version 9.5.x extensions supported on Amazon RDS \(p. 1534\)](#)

## Restricting installation of PostgreSQL extensions

You can restrict which extensions can be installed on a PostgreSQL DB instance. To do so, set the `rds.allowed_extensions` parameter to a string of comma-separated extension names. Only these extensions can then be installed in the PostgreSQL DB instance.

The default string for the `rds.allowed_extensions` parameter is `**`, which means that any extension available for the engine version can be installed. Changing the `rds.allowed_extensions` parameter does not require a database restart because it's a dynamic parameter.

The PostgreSQL DB instance engine must be one of the following versions for you to use the `rds.allowed_extensions` parameter:

- PostgreSQL 13.2 or a later minor version
- PostgreSQL 12.6 or a later minor version

To see which extension installations are allowed, use the following `psql` command.

```
postgres=>SHOW rds.allowed_extensions;
rds.allowed_extensions

*
```

If an extension was installed prior to it being left out of the list in the `rds.allowed_extensions` parameter, the extension can still be used normally, and commands such as `ALTER EXTENSION` and

`DROP EXTENSION` will continue to work. However, after an extension is restricted, `CREATE EXTENSION` commands for the restricted extension will fail.

Installation of extension dependencies with `CREATE EXTENSION CASCADE` are also restricted. The extension and its dependencies must be specified in `rds.allowed_extensions`. If an extension dependency installation fails, the entire `CREATE EXTENSION CASCADE` statement will fail.

If an extension is not included with the `rds.allowed_extensions` parameter, you will see an error such as the following if you try to install it.

```
ERROR: permission denied to create extension "extension-name"
HINT: This extension is not specified in "rds.allowed_extensions".
```

## PostgreSQL version 13 extensions supported on Amazon RDS

The following table shows PostgreSQL extensions for PostgreSQL version 13 that are currently supported on Amazon RDS. For more information on PostgreSQL extensions, see [Packaging related objects into an extension](#).

Extension	13.1	13.2
<a href="#">address_standardizer</a>	3.0.2	3.0.2
<a href="#">address_standardizer_data_us</a>	3.0.2	3.0.2
<a href="#">amcheck</a>	1.2	1.2
<a href="#">aws_commons (p. 1598)</a>	1.1	1.1
<a href="#">aws_lambda (p. 1656)</a>	NA	1.0
<a href="#">aws_s3.table_import_from_s3 (p. 1598)</a> <a href="#">aws_s3.query_export_to_s3 (p. 1613)</a>		1.1
<a href="#">bloom</a>	1.0	1.0
<a href="#">bool_plperl</a>	1.0	1.0
<a href="#">btree_gin</a>	1.3	1.3
<a href="#">btree_gist</a>	1.5	1.5
<a href="#">citext</a>	1.6	1.6
<a href="#">cube</a>	1.4	1.4

<a href="#">uuid-ossp</a>	1.1	1.1
<a href="#">wal2json</a>	2.3	2.3

## PostgreSQL trusted extensions

To install most PostgreSQL extensions requires `rds_superuser` privileges. PostgreSQL 13 introduced [trusted extensions](#), which reduces the need to grant `rds_superuser` privileges to regular users. With this feature, users can install many extensions if they have the `CREATE` privilege on the current database instead of requiring the `rds_superuser` role. For more information, see the SQL [CREATE EXTENSION](#) command in the PostgreSQL documentation.

The following lists the extensions that can be installed by a user who has the `CREATE` privilege on the current database and do not require the `rds_superuser` role:

- [bool\\_plperl](#)
- [btree\\_gin](#)
- [btree\\_gist](#)
- [citext](#)
- [cube](#)
- [dict\\_int](#)
- [fuzzystrmatch](#)
- [hstore](#)
- [intarray](#)
- [isn](#)
- [jsonb\\_plperl](#)
- [ltree](#)
- [pg\\_trgm](#)
- [pgcrypto](#)
- [plperl](#)
- [plpgsql](#)
- [pltcl](#)
- [tablefunc](#)
- [tsm\\_system\\_rows](#)
- [tsm\\_system\\_time](#)
- [unaccent](#)
- [uuid-ossp](#)

## PostgreSQL version 12 extensions supported on Amazon RDS

The following table shows PostgreSQL extensions for PostgreSQL version 12 that are currently supported on Amazon RDS. For more information on PostgreSQL extensions, see [Packaging related objects into an extension](#).

Extension	12.2	12.3	12.4	12.5	12.6
<a href="#">address_standardizer</a>	3.0.0	3.0.0	3.0.0	3.0.0	3.0.2
<a href="#">address_standardizer_data_us</a>	3.0.0	3.0.0	3.0.0	3.0.0	3.0.2
<a href="#">amcheck</a>	1.2	1.2	1.2	1.2	1.2
<a href="#">aws_commons</a> (p. 1598)	1.0	1.0	1.0	1.0	1.0
<a href="#">aws_lambda</a> (p. 1656)	NA	NA	NA	NA	1.0
<a href="#">aws_s3.table_import_from_s3</a> (p. 1698) <a href="#">aws_s3.query_export_to_s3</a> (p. 1613)		1.0	1.1	1.1	1.1
<a href="#">bloom</a>	1.0	1.0	1.0	1.0	1.0
<a href="#">btree_gin</a>	1.3	1.3	1.3	1.3	1.3
<a href="#">btree_gist</a>	1.5	1.5	1.5	1.5	1.5

Extension	12.2	12.3	12.4	12.5	12.6
<a href="#">citext</a>	1.6	1.6	1.6	1.6	1.6
<a href="#">cube</a>	1.4	1.4	1.4	1.4	1.4
<a href="#">dblink</a>	1.2	1.2	1.2	1.2	1.2

## PostgreSQL version 9.5.x extensions supported on Amazon RDS

The following tables show PostgreSQL extensions for PostgreSQL version 9.5.x that are currently supported by PostgreSQL on Amazon RDS. "N/A" indicates that the extension is not available for that PostgreSQL version. For more information on PostgreSQL extensions, see [Packaging related objects into an extension](#).

Extension	9.5.2	9.5.4	9.5.6	9.5.7	9.5.9	9.5.1	9.5.1	9.5.1	9.5.1	9.5.1	9.5.1	9.5.1	9.5.1	9.5.2	9.5.2	9.5.2	9.5.2	9.5.25

## Using the log\_fdw extension

The `log_fdw` extension is new for Amazon RDS for PostgreSQL version 9.6.2 and later. Using this extension, you can access your database engine log using a SQL interface. In addition to viewing the `stderr` log files that are generated by default on RDS, you can view CSV logs (set the `log_destination` parameter to `csvlog`) and build foreign tables with the data neatly split into several columns.

This extension introduces two new functions that make it easy to create foreign tables for database logs:

- `list_postgres_log_files()` – Lists the files in the database log directory and the file size in bytes.
- `create_foreign_table_for_log_file(table_name text, server_name text, log_file_name text)` – Builds a foreign table for the specified file in the current database.

All functions created by `log_fdw` are owned by `rds_superuser`. Members of the `rds_superuser` role can grant access to these functions to other database users.

The following example shows how to use the `log_fdw` extension.

### To use the log\_fdw extension

1. Get the `log_fdw` extension.

```
postgres=> CREATE EXTENSION log_fdw;
CREATE EXTENSION
```

2. Create the log server as a foreign data wrapper.

```
postgres=> CREATE SERVER log_server FOREIGN DATA WRAPPER log_fdw;
CREATE SERVER
```

3. Select all from a list of log files.

```
postgres=> SELECT * from list_postgres_log_files() order by 1;
```

A sample response is as follows.

```
file_name | file_size_bytes

postgresql.log.2016-08-09-22.csv | 1111
postgresql.log.2016-08-09-23.csv | 1172
postgresql.log.2016-08-10-00.csv | 1744
postgresql.log.2016-08-10-01.csv | 1102
(4 rows)
```

4. Create a table with a single 'log\_entry' column for non-CSV files.

```
postgres=> SELECT create_foreign_table_for_log_file('my_postgres_error_log',
 'log_server', 'postgresql.log.2016-08-09-22.csv');
```

A sample response is as follows.

```

(1 row)
```

5. Select a sample of the log file. The following code retrieves the log time and error message description.

```
postgres=> SELECT log_time, message from my_postgres_error_log order by 1;
```

A sample response is as follows.

```
log_time | message

Tue Aug 09 15:45:18.172 2016 PDT | ending log output to stderr
Tue Aug 09 15:45:18.175 2016 PDT | database system was interrupted; last known up at
2016-08-09 22:43:34 UTC
Tue Aug 09 15:45:18.223 2016 PDT | checkpoint record is at 0/90002E0
Tue Aug 09 15:45:18.223 2016 PDT | redo record is at 0/90002A8; shutdown FALSE
Tue Aug 09 15:45:18.223 2016 PDT | next transaction ID: 0/1879; next OID: 24578
Tue Aug 09 15:45:18.223 2016 PDT | next MultiXactId: 1; next MultiXactOffset: 0
Tue Aug 09 15:45:18.223 2016 PDT | oldest unfrozen transaction ID: 1822, in database 1
(7 rows)
```

## Upgrading plv8

If you use [plv8](#) and upgrade PostgreSQL to a new plv8 version, you immediately take advantage of the new extension. Take the following steps to synchronize your catalog metadata with the new version of

plv8. These steps are optional, but we highly recommended that you complete them to avoid metadata mismatch warnings.

### To synchronize your catalog metadata with a new version of plv8

1. Verify that you need to update. To do this, run the following command while connected to your instance.

```
select * from pg_available_extensions where name in
('plv8','plls','plcoffee');
```

If your results contain values for an installed version that is a lower number than the default version, continue with this procedure to update your extensions.

For example, the following result set indicates that you should update.

name	default_version	installed_version	comment
plls	2.1.0	1.5.3	PL/LiveScript (v8) trusted procedural language
plcoffee	2.1.0	1.5.3	PL/CoffeeScript (v8) trusted procedural language
plv8	2.1.0	1.5.3	PL/JavaScript (v8) trusted procedural language

(3 rows)

2. Take a snapshot of your instance as a precaution, because the upgrade drops all your plv8 functions. You can continue with the following steps while the snapshot is being created.

For steps to create a snapshot see, [Creating a DB snapshot \(p. 349\)](#)

3. Get a count of the number of plv8 functions in your DB instance so you can validate that they are all in place after the upgrade.

The following code returns the number of functions written in plv8, plcoffee, or plls.

```
select proname, nspname, lanname
from pg_proc p, pg_language l, pg_namespace n
where p.prolang = l.oid
and n.oid = p.pronamespace
and lanname in ('plv8','plcoffee','plls');
```

4. Use pg\_dump to create a schema-only dump file.

The following code creates a file on your client machine in the /tmp directory.

```
./pg_dump -Fc --schema-only -U master postgres > /tmp/test.dmp
```

This example uses the following options:

- -FC "format custom"
- --schema-only "will only dump commands necessary to create schema (functions in our case)"
- -U "rds master username"
- database "the database name in our instance"

For more information on pg\_dump, see the [pg\\_dump](#) page in the PostgreSQL documentation.

5. Extract the "CREATE FUNCTION" DDL statement that is present in the dump file.

The following code extracts the DDL statement needed to create the functions. You use this in subsequent steps to recreate the functions. The code uses the `grep` command to extract the statements to a file.

```
./pg_restore -l /tmp/test.dmp | grep FUNCTION > /tmp/function_list/
```

For more information on `pg_restore` see, [pg\\_restore](#).

6. Drop the functions and extensions.

The following code drops any plv8 based objects. The `cascade` option ensures that any dependent are dropped.

```
drop extension plv8 cascade;
```

If your PostgreSQL instance contains objects based on plcoffee or plls, repeat this step for those extensions.

7. Create the extensions.

The following code creates the plv8, plcoffee, and plls extensions.

```
create extension plv8;
create extension plcoffee;
create extension plls;
```

8. Create the functions using the dump file and "driver" file.

The following code recreates the functions that you extracted previously.

```
./pg_restore -U master -d postgres -Fc -L /tmp/function_list /tmp/test.dmp
```

9. Verify your functions count.

Validate that your functions have all been recreated by running the following code statement.

```
select * from pg_available_extensions where name in
('plv8','plls','plcoffee');
```

**Note**

The plv8 version 2 adds the following extra row to your result set:

proname	nspname	lanname
plv8_version	pg_catalog	plv8

## Logical replication for PostgreSQL on Amazon RDS

Beginning with PostgreSQL version 10.4, RDS supports the publication and subscription SQL Syntax for PostgreSQL 10 Logical Replication.

### To enable logical replication for an Amazon RDS for PostgreSQL DB instance

1. The AWS user account requires the `rds_superuser` role to perform logical replication for the PostgreSQL database on Amazon RDS.
2. Set the `rds.logical_replication` static parameter to 1.

3. Modify the inbound rules of the security group for the publisher instance (production) to allow the subscriber instance (replica) to connect. This is usually done by including the IP address of the subscriber in the security group.
4. Restart the DB instance for the changes to the static parameter `rds.logical_replication` to take effect.

For more information on PostgreSQL logical replication, see the [PostgreSQL documentation](#).

#### Topics

- [Logical decoding and logical replication \(p. 1541\)](#)
- [Working with logical replication slots \(p. 1541\)](#)

## Logical decoding and logical replication

RDS for PostgreSQL supports the streaming of WAL changes using logical replication slots. Amazon RDS supports logical decoding for a PostgreSQL DB instance version 9.5.4 and higher. You can set up logical replication slots on your instance and stream database changes through these slots to a client such as `pg_recvlogical`. Logical replication slots are created at the database level and support replication connections to a single database.

The most common clients for PostgreSQL logical replication are the AWS Database Migration Service or a custom-managed host on an Amazon EC2 instance. The logical replication slot knows nothing about the receiver of the stream, and there is no requirement that the target be a replica database. If you set up a logical replication slot and don't read from the slot, data can be written and quickly fill up your DB instance's storage.

PostgreSQL logical replication and logical decoding on Amazon RDS are enabled with a parameter, a replication connection type, and a security role. The client for logical decoding can be any client that is capable of establishing a replication connection to a database on a PostgreSQL DB instance.

### To enable logical decoding for an Amazon RDS for PostgreSQL DB instance

1. The user account requires the `rds_superuser` role to enable logical replication. The user account also requires the `rds_replication` role to grant permissions to manage logical slots and to stream data using logical slots.
2. Set the `rds.logical_replication` static parameter to 1. As part of applying this parameter, we also set the parameters `wal_level`, `max_wal_senders`, `max_replication_slots`, and `max_connections`. These parameter changes can increase WAL generation, so you should only set the `rds.logical_replication` parameter when you are using logical slots.
3. Reboot the DB instance for the static `rds.logical_replication` parameter to take effect.
4. Create a logical replication slot as explained in the next section. This process requires that you specify a decoding plugin. Currently we support the `test_decoding` and `wal2json` output plugins that ship with PostgreSQL.

For more information on PostgreSQL logical decoding, see the [PostgreSQL documentation](#).

## Working with logical replication slots

You can use SQL commands to work with logical slots. For example, the following command creates a logical slot named `test_slot` using the default PostgreSQL output plugin `test_decoding`.

```
SELECT * FROM pg_create_logical_replication_slot('test_slot', 'test_decoding');
slot_name | xlog_position
-----+-----
```

```
regression_slot | 0/16B1970
(1 row)
```

To list logical slots, use the following command.

```
SELECT * FROM pg_replication_slots;
```

To drop a logical slot, use the following command.

```
SELECT pg_drop_replication_slot('test_slot');
pg_drop_replication_slot

(1 row)
```

For more examples on working with logical replication slots, see [Logical decoding examples](#) in the PostgreSQL documentation.

After you create the logical replication slot, you can start streaming. The following example shows how logical decoding is controlled over the streaming replication protocol. This uses the program `pg_recvlogical`, which is included in the PostgreSQL distribution. This requires that client authentication is set up to allow replication connections.

```
pg_recvlogical -d postgres --slot test_slot -U master
 --host sg-postgresql1.c6c8mresaghgv0.us-west-2.rds.amazonaws.com
 -f - --start
```

To see the contents of the `pg_replication_origin_status` view, query the `pg_show_replication_origin_status()` function.

```
SELECT * FROM pg_show_replication_origin_status();
local_id | external_id | remote_lsn | local_lsn
-----+-----+-----+
(0 rows)
```

## Event triggers for PostgreSQL on Amazon RDS

PostgreSQL versions 9.5.4 and later support event triggers, and Amazon RDS supports event triggers for these versions. You can use the master user account to create, modify, rename, and delete event triggers. Event triggers are at the DB instance level, so they can apply to all databases on an instance.

For example, the following code creates an event trigger that prints the current user at the end of every DDL command.

```
CREATE OR REPLACE FUNCTION raise_notice_func()
RETURNS event_trigger
LANGUAGE plpgsql AS
$$
BEGIN
 RAISE NOTICE 'In trigger function: %', current_user;
END;
$$;

CREATE EVENT TRIGGER event_trigger_1
 ON ddl_command_end
EXECUTE PROCEDURE raise_notice_func();
```

For more information about PostgreSQL event triggers, see [Event triggers](#) in the PostgreSQL documentation.

There are several limitations to using PostgreSQL event triggers on Amazon RDS. These include:

- You cannot create event triggers on read replicas. You can, however, create event triggers on a read replica source. The event triggers are then copied to the read replica. The event triggers on the read replica don't fire on the read replica when changes are pushed from the source. However, if the read replica is promoted, the existing event triggers fire when database operations occur.
- To perform a major version upgrade to a PostgreSQL DB instance that uses event triggers, you must delete the event triggers before you upgrade the instance.

## Huge pages for Amazon RDS for PostgreSQL

Amazon RDS for PostgreSQL supports multiple page sizes for PostgreSQL versions 9.5.6 and later, and 9.6.2 and later. This support includes 4 K and 2 MB page sizes.

Huge pages reduce overhead when using large contiguous chunks of memory. You allocate huge pages for your application by using calls to *mmap* or SYSV shared memory. You enable huge pages on an Amazon RDS for PostgreSQL database by using the `huge_pages` parameter. Set this parameter to "on" to enable huge pages.

For PostgreSQL versions 10 and above, huge pages are enabled for all instance classes. For PostgreSQL versions below 10, huge pages are enabled by default for `db.r4.*`, `db.m4.16xlarge`, and `db.m5.*` instance classes. For other instance classes, huge pages are disabled by default.

When you set the `huge_pages` parameter to "on," Amazon RDS uses huge pages based on the available shared memory. If the DB instance is unable to use huge pages due to shared memory constraints, Amazon RDS prevents the instance from starting and sets the status of the DB instance to an incompatible parameters state. In this case, you can set the `huge_pages` parameter to "off" to allow Amazon RDS to start the DB instance.

The `shared_buffers` parameter is key to setting the shared memory pool that is required for using huge pages. The default value for the `shared_buffers` parameter is set to a percentage of the total 8K pages available for that instance's memory. When you use huge pages, those pages are allocated in the huge pages collocated together. Amazon RDS puts a DB instance into an incompatible parameters state if the shared memory parameters are set to require more than 90 percent of the DB instance memory. For more information about setting shared memory for PostgreSQL, see the [PostgreSQL documentation](#).

**Note**

Huge pages are not supported for the `db.m1`, `db.m2`, and `db.m3` DB instance classes.

## Tablespaces for PostgreSQL on Amazon RDS

PostgreSQL on Amazon RDS supports tablespaces for compatibility. Because all storage is on a single logical volume, you can't use tablespaces for IO splitting or isolation. Our benchmarks and experience indicate that a single logical volume is the best setup for most use cases.

If you specify a file name when you create a tablespace, the path prefix is `/rdsdbdata/db/base/` `tablespace`. The following example places tablespace files in `/rdsdbdata/db/base/tablespace/` `data`.

```
CREATE TABLESPACE act_data
 OWNER dbadmin
```

```
LOCATION '/data';
```

## Autovacuum for PostgreSQL on Amazon RDS

The PostgreSQL autovacuum feature is turned on by default for new PostgreSQL DB instances. Autovacuum is optional, but we highly recommend that you do not turn autovacuum off. For more information on using autovacuum with Amazon RDS for PostgreSQL, see [Working with PostgreSQL autovacuum on Amazon RDS \(p. 1631\)](#).

## RAM disk for the stats\_temp\_directory

The Amazon RDS for PostgreSQL parameter, `rds.pg_stat_ramdisk_size`, can be used to specify the system memory allocated to a RAM disk for storing the PostgreSQL `stats_temp_directory`. The RAM disk parameter is available for all PostgreSQL versions on Amazon RDS.

Under certain workloads, setting this parameter can improve performance and decrease IO requirements. For more information about the `stats_temp_directory`, see [the PostgreSQL documentation..](#)

To enable a RAM disk for your `stats_temp_directory`, set the `rds.pg_stat_ramdisk_size` parameter to a non-zero value in the parameter group used by your DB instance. The parameter value is in MB. You must reboot the DB instance before the change takes effect.

For example, the following AWS CLI command sets the RAM disk parameter to 256 MB.

```
aws rds modify-db-parameter-group \
 --db-parameter-group-name pg-95-ramdisk-testing \
 --parameters "ParameterName=rds.pg_stat_ramdisk_size, ParameterValue=256,
 ApplyMethod=pending-reboot"
```

After you reboot, run the following command to see the status of the `stats_temp_directory`:

```
postgres=>show stats_temp_directory;
```

The command should return the following:

```
stats_temp_directory

/rdsdbramdisk/pg_stat_tmp
(1 row)
```

## ALTER ENUM for PostgreSQL

Amazon RDS for PostgreSQL versions 9.6.2 and 9.5.6 and later support the ability to alter enumerations. This feature is not available in other versions on Amazon RDS.

The following code shows an example of altering an enum value.

```
postgres=> CREATE TYPE rainbow AS ENUM ('red', 'orange', 'yellow', 'green', 'blue',
 'purple');
```

```
CREATE TYPE
postgres=> CREATE TABLE t1 (colors rainbow);
CREATE TABLE
postgres=> INSERT INTO t1 VALUES ('red'), ('orange');
INSERT 0 2
postgres=> SELECT * from t1;
colors

red
orange
(2 rows)
postgres=> ALTER TYPE rainbow RENAME VALUE 'red' TO 'crimson';
ALTER TYPE
postgres=> SELECT * from t1;
colors

crimson
orange
(2 rows)
```

# Connecting to a DB instance running the PostgreSQL database engine

After Amazon RDS provisions your DB instance, you can use any standard SQL client application to connect to the instance. To list the details of an Amazon RDS DB instance, you can use the AWS Management Console, the AWS CLI [describe-db-instances](#) command, or the Amazon RDS API [DescribeDBInstances](#) operation. You need the following information to connect:

- The host or host name for the DB instance, for example:

```
myinstance.123456789012.us-east-1.rds.amazonaws.com
```

- The port on which the DB instance is listening. For example, the default PostgreSQL port is 5432.
- The user name and password for the DB instance.

Following are two ways to connect to a PostgreSQL DB instance. The first example uses pgAdmin, a popular open-source administration and development tool for PostgreSQL. The second example uses psql, a command line utility that is part of a PostgreSQL installation.

## Topics

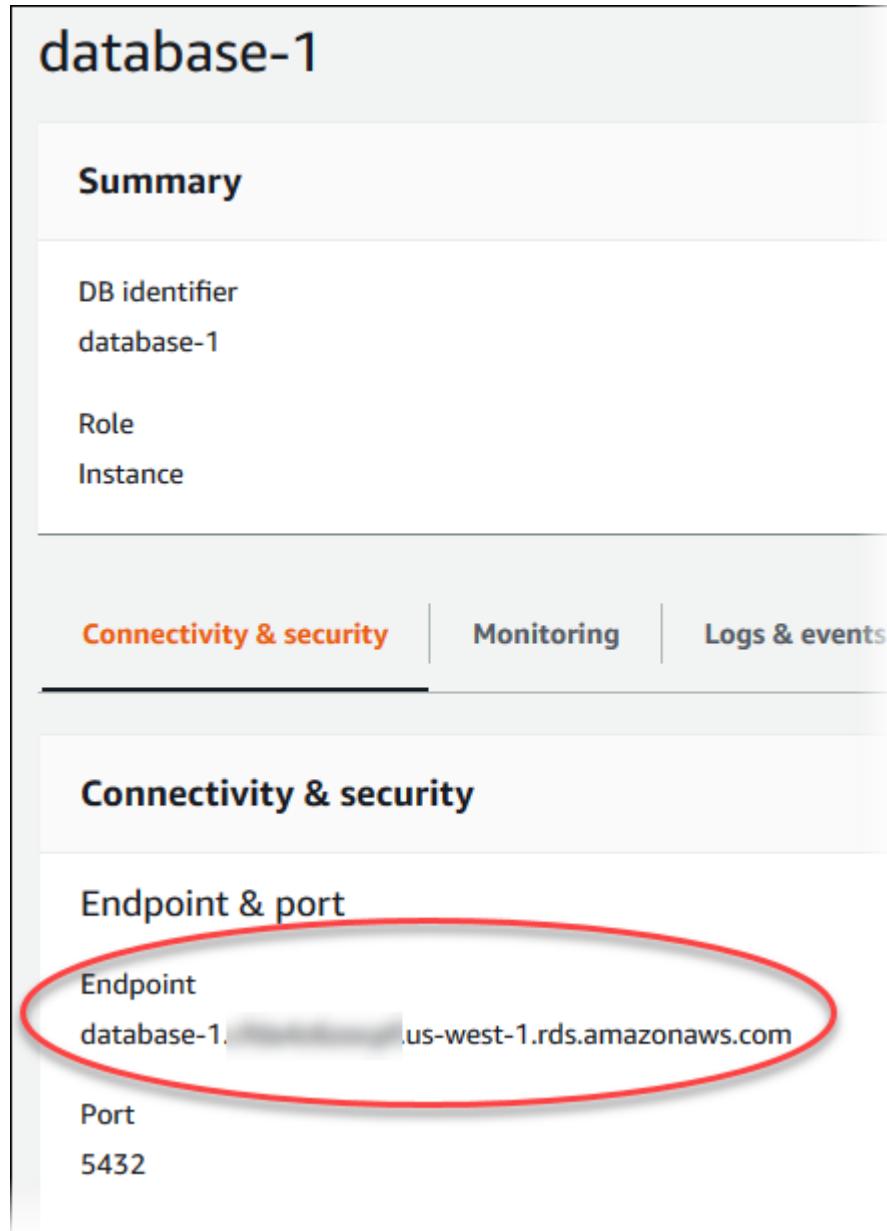

- [Using pgAdmin to connect to a PostgreSQL DB instance \(p. 1546\)](#)
- [Using psql to connect to a PostgreSQL DB instance \(p. 1548\)](#)
- [Troubleshooting connections to your PostgreSQL instance \(p. 1549\)](#)

## Using pgAdmin to connect to a PostgreSQL DB instance

You can use the open-source tool pgAdmin to connect to a PostgreSQL DB instance.

### To connect to a PostgreSQL DB instance using pgAdmin

1. Find the endpoint (DNS name) and port number for your DB Instance.
  - a. Open the RDS console and then choose **Databases** to display a list of your DB instances.
  - b. Choose the PostgreSQL DB instance name to display its details.
  - c. On the **Connectivity & security** tab, copy the endpoint. Also, note the port number. You need both the endpoint and the port number to connect to the DB instance.

database-1

**Summary**

DB identifier  
database-1

Role  
Instance

**Connectivity & security**    Monitoring    Logs & events

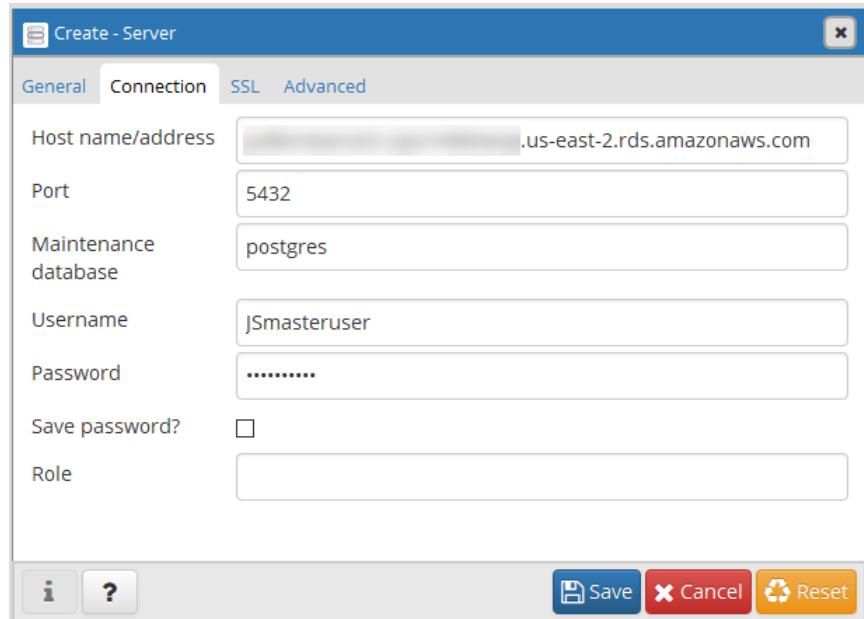

**Connectivity & security**

**Endpoint & port**

Endpoint  
database-1.us-west-1.rds.amazonaws.com

Port  
5432

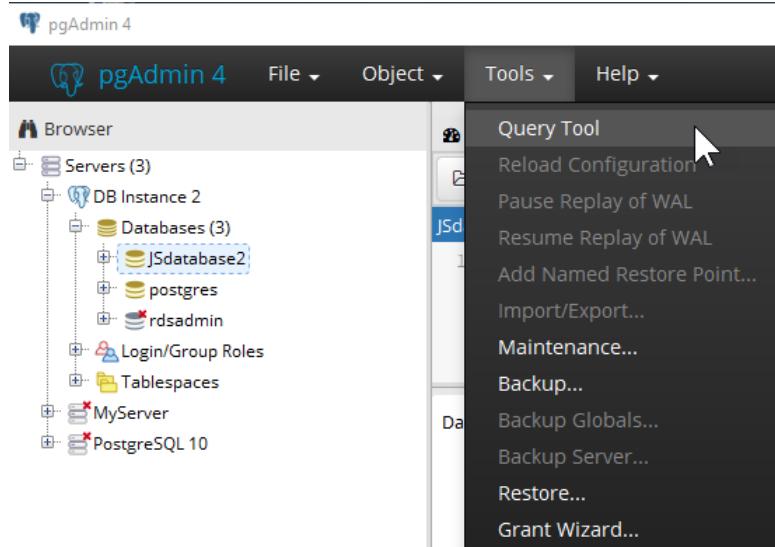

2. Install pgAdmin from <http://www.pgadmin.org/>. You can download and use pgAdmin without having a local instance of PostgreSQL on your client computer.
3. Launch the pgAdmin application on your client computer.
4. On the **Dashboard** tab, choose **Add New Server**.
5. In the **Create - Server** dialog box, type a name on the **General** tab to identify the server in pgAdmin.
6. On the **Connection** tab, type the following information from your DB instance:
  - For **Host**, type the endpoint, for example `mypostgresql.c6c8dntfzzhgv0.us-east-2.rds.amazonaws.com`.
  - For **Port**, type the assigned port.
  - For **Username**, type the user name that you entered when you created the DB instance.
  - For **Password**, type the password that you entered when you created the DB instance.

7. Choose **Save**.

If you have any problems connecting, see [Troubleshooting connections to your PostgreSQL instance \(p. 1549\)](#).

8. To access a database in the pgAdmin browser, expand **Servers**, the DB instance, and **Databases**. Choose the DB instance's database name.

9. To open a panel where you can enter SQL commands, choose **Tools**, **Query Tool**.

## Using psql to connect to a PostgreSQL DB instance

You can use a local instance of the psql command line utility to connect to a PostgreSQL DB instance. You need either PostgreSQL or the psql client installed on your client computer. To connect to your PostgreSQL DB instance using psql, you need to provide host information and access credentials.

Use one of the following formats to connect to a PostgreSQL DB instance on Amazon RDS. When you connect, you're prompted for a password. For batch jobs or scripts, use the `--no-password` option. This option is set for the entire session.

**Note**

A connection attempt with `--no-password` fails when the server requires password authentication and a password is not available from other sources. For more information, see the [psql documentation](#).

If this is the first time you are connecting to this DB instance, try using the default database name `postgres` for the `--dbname` option.

For Unix, use the following format.

```
psql \
 --host=<DB instance endpoint> \
 --port=<port> \
 --username=<master username> \
 --password \
 --dbname=<database name>
```

For Windows, use the following format.

```
psql ^
 --host=<DB instance endpoint> ^
 --port=<port> ^
 --username=<master username> ^
 --password ^
 --dbname=<database name>
```

For example, the following command connects to a database called `mypgdb` on a PostgreSQL DB instance called `mypostgresql` using fictitious credentials.

```
psql --host=mypostgresql.c6c8mwvfdgv0.us-west-2.rds.amazonaws.com --port=5432 --
username=awsuser --password --dbname=mypgdb
```

## Troubleshooting connections to your PostgreSQL instance

### Topics

- [Error – FATAL: database `name` does not exist \(p. 1549\)](#)
- [Error – Could not connect to server: Connection timed out \(p. 1549\)](#)
- [Errors with security group access rules \(p. 1550\)](#)

### Error – FATAL: database `name` does not exist

If when trying to connect you receive an error like `FATAL: database name does not exist`, try using the default database name `postgres` for the `--dbname` option.

### Error – Could not connect to server: Connection timed out

If you can't connect to the DB instance, the most common error is `Could not connect to server: Connection timed out`. If you receive this error, check the following:

- Check that the host name used is the DB instance endpoint and that the port number used is correct.
- Make sure that the DB instance's public accessibility is set to **Yes** to allow external connections. To modify the **Public access** setting, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- Check that the security group assigned to the DB instance has rules to allow access through any firewall your connection might go through. For example, if the DB instance was created using the default port of 5432, your company might have firewall rules blocking connections to that port from external company devices.

To fix this, modify the DB instance to use a different port. Also, make sure that the security group applied to the DB instance allows connections to the new port. To modify the **Database port** setting, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

- See also [Errors with security group access rules \(p. 1550\)](#).

## Errors with security group access rules

By far the most common connection problem is with the security group's access rules assigned to the DB instance. If you used the default DB security group when you created the DB instance, the security group likely didn't have access rules that allow you to access the instance.

For the connection to work, the security group you assigned to the DB instance at its creation must allow access to the DB instance. For example, if the DB instance was created in a VPC, it must have a VPC security group that authorizes connections. Check if the DB instance was created using a security group that doesn't authorize connections from the device or Amazon EC2 instance where the application is running.

You can add or edit an inbound rule in the security group. For **Source**, choosing **My IP** allows access to the DB instance from the IP address detected in your browser. For more information, see [Provide access to your DB instance in your VPC by creating a security group \(p. 69\)](#).

Alternatively, if the DB instance was created outside of a VPC, it must have a database security group that authorizes those connections.

For more information about Amazon RDS security groups, see [Controlling access with security groups \(p. 1737\)](#).

# Security with RDS for PostgreSQL

Security with RDS for PostgreSQL includes the following topics.

## Topics

- [Using SSL with a PostgreSQL DB instance \(p. 1551\)](#)
- [Updating applications to connect to PostgreSQL DB instances using new SSL/TLS certificates \(p. 1554\)](#)
- [Using Kerberos authentication with Amazon RDS for PostgreSQL \(p. 1558\)](#)

## Using SSL with a PostgreSQL DB instance

Amazon RDS supports Secure Socket Layer (SSL) encryption for PostgreSQL DB instances. Using SSL, you can encrypt a PostgreSQL connection between your applications and your PostgreSQL DB instances. You can also force all connections to your PostgreSQL DB instance to use SSL.

Amazon RDS for PostgreSQL supports Transport Layer Security (TLS) versions 1.1 and 1.2. Amazon RDS doesn't enforce TLS connections so they must be enforced from your application.

For general information about SSL support and PostgreSQL databases, see [SSL support](#) in the PostgreSQL documentation. For information about using an SSL connection over JDBC, see [Configuring the client](#) in the PostgreSQL documentation.

SSL support is available in all AWS Regions for PostgreSQL. Amazon RDS creates an SSL certificate for your PostgreSQL DB instance when the instance is created. If you enable SSL certificate verification, then the SSL certificate includes the DB instance endpoint as the Common Name (CN) for the SSL certificate to guard against spoofing attacks.

## Topics

- [Connecting to a PostgreSQL DB instance over SSL \(p. 1551\)](#)
- [Requiring an SSL connection to a PostgreSQL DB instance \(p. 1552\)](#)
- [Determining the SSL connection status \(p. 1552\)](#)
- [SSL cipher suites in RDS for PostgreSQL \(p. 1553\)](#)

## Connecting to a PostgreSQL DB instance over SSL

### To connect to a PostgreSQL DB instance over SSL

1. Download the certificate.

For information about downloading certificates, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

2. Import the certificate into your operating system.

For sample scripts that import certificates, see [Sample script for importing certificates into your trust store \(p. 1680\)](#).

3. Connect to your PostgreSQL DB instance over SSL.

When you connect using SSL, your client can choose whether to verify the certificate chain. If your connection parameters specify `sslmode=verify-ca` or `sslmode=verify-full`, then your client requires the RDS CA certificates to be in their trust store or referenced in the connection URL. This requirement is to verify the certificate chain that signs your database certificate.

When a client, such as `psql` or `JDBC`, is configured with SSL support, the client first tries to connect to the database with SSL by default. If the client can't connect with SSL, it reverts to connecting without SSL. The default `sslmode` mode used is different between `libpq`-based clients (such as `psql`) and `JDBC`. The `libpq`-based clients default to `prefer`, and `JDBC` clients default to `verify-full`.

Use the `sslrootcert` parameter to reference the certificate, for example `sslrootcert=rds-ssl-ca-cert.pem`.

The following is an example of using `psql` to connect to a PostgreSQL DB instance.

```
$ psql -h testpg.cdhmuqifdpib.us-east-1.rds.amazonaws.com -p 5432 \
 "dbname=testpg user=testuser sslrootcert=rds-ca-2019-root.pem sslmode=verify-full"
```

## Requiring an SSL connection to a PostgreSQL DB instance

You can require that connections to your PostgreSQL DB instance use SSL by using the `rds.force_ssl` parameter. By default, the `rds.force_ssl` parameter is set to 0 (off). You can set the `rds.force_ssl` parameter to 1 (on) to require SSL for connections to your DB instance. Updating the `rds.force_ssl` parameter also sets the PostgreSQL `ssl` parameter to 1 (on) and modifies your DB instance's `pg_hba.conf` file to support the new SSL configuration.

You can set the `rds.force_ssl` parameter value by updating the parameter group for your DB instance. If the parameter group for your DB instance isn't the default one, and the `ssl` parameter is already set to 1 when you set `rds.force_ssl` to 1, you don't need to reboot your DB instance. Otherwise, you must reboot your DB instance for the change to take effect. For more information on parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

When the `rds.force_ssl` parameter is set to 1 for a DB instance, you see output similar to the following when you connect, indicating that SSL is now required:

```
$ psql postgres -h SOMEHOST.amazonaws.com -p 8192 -U someuser
. . .
SSL connection (cipher: DHE-RSA-AES256-SHA, bits: 256)
Type "help" for help.

postgres=>
```

## Determining the SSL connection status

The encrypted status of your connection is shown in the logon banner when you connect to the DB instance:

```
Password for user master:
psql (10.3)
SSL connection (cipher: DHE-RSA-AES256-SHA, bits: 256)
Type "help" for help.

postgres=>
```

You can also load the `sslinfo` extension and then call the `ssl_is_used()` function to determine if SSL is being used. The function returns `t` if the connection is using SSL, otherwise it returns `f`.

```
postgres=> create extension sslinfo;
CREATE EXTENSION

postgres=> select ssl_is_used();
 ssl_is_used

 t
(1 row)
```

You can use the `select ssl_cipher()` command to determine the SSL cipher:

```
postgres=> select ssl_cipher();
 ssl_cipher

 DHE-RSA-AES256-SHA
(1 row)
```

If you enable `set rds.force_ssl` and restart your instance, non-SSL connections are refused with the following message:

```
$ export PGSSLMODE=disable
$ psql postgres -h SOMEHOST.amazonaws.com -p 8192 -U someuser
psql: FATAL: no pg_hba.conf entry for host "host.ip", user "someuser", database "postgres",
 SSL off
$
```

For information about the `sslmode` option, see [Database connection control functions](#) in the PostgreSQL documentation.

## SSL cipher suites in RDS for PostgreSQL

The PostgreSQL configuration parameter `ssl_ciphers` specifies the categories of cipher suites that are allowed for SSL connections. The following table lists the default cipher suites used in RDS for PostgreSQL.

PostgreSQL engine version	Cipher suites
13	HIGH:!aNULL:!3DES
12	HIGH:!aNULL:!3DES
11.4 and higher minor versions	HIGH:MEDIUM:+3DES:!aNULL:!RC4
11.1, 11.2	HIGH:MEDIUM:+3DES:!aNULL
10.9 and higher minor versions	HIGH:MEDIUM:+3DES:!aNULL:!RC4
10.7 and lower minor versions	HIGH:MEDIUM:+3DES:!aNULL
9.6.14 and higher minor versions	HIGH:MEDIUM:+3DES:!aNULL:!RC4
9.6.12 and lower minor versions	HIGH:MEDIUM:+3DES:!aNULL

## Updating applications to connect to PostgreSQL DB instances using new SSL/TLS certificates

As of September 19, 2019, Amazon RDS has published new Certificate Authority (CA) certificates for connecting to your RDS DB instances using Secure Socket Layer or Transport Layer Security (SSL/TLS). Following, you can find information about updating your applications to use the new certificates.

This topic can help you to determine whether any client applications use SSL/TLS to connect to your DB instances. If they do, you can further check whether those applications require certificate verification to connect.

### Note

Some applications are configured to connect to PostgreSQL DB instances only if they can successfully verify the certificate on the server.

For such applications, you must update your client application trust stores to include the new CA certificates.

After you update your CA certificates in the client application trust stores, you can rotate the certificates on your DB instances. We strongly recommend testing these procedures in a development or staging environment before implementing them in your production environments.

For more information about certificate rotation, see [Rotating your SSL/TLS certificate \(p. 1673\)](#). For more information about downloading certificates, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#). For information about using SSL/TLS with PostgreSQL DB instances, see [Using SSL with a PostgreSQL DB instance \(p. 1551\)](#).

### Topics

- [Determining whether applications are connecting to PostgreSQL DB instances using SSL \(p. 1554\)](#)
- [Determining whether a client requires certificate verification in order to connect \(p. 1555\)](#)
- [Updating your application trust store \(p. 1555\)](#)
- [Using SSL/TLS connections for different types of applications \(p. 1556\)](#)

## Determining whether applications are connecting to PostgreSQL DB instances using SSL

Check the DB instance configuration for the value of the `rds.force_ssl` parameter. By default, the `rds.force_ssl` parameter is set to 0 (off). If the `rds.force_ssl` parameter is set to 1 (on), clients are required to use SSL/TLS for connections. For more information about parameter groups, see [Working with DB parameter groups \(p. 229\)](#).

If you are using RDS PostgreSQL version 9.5 or later major version and `rds.force_ssl` is not set to 1 (on), query the `pg_stat_ssl` view to check connections using SSL. For example, the following query returns only SSL connections and information about the clients using SSL.

```
select datname, usename, ssl, client_addr from pg_stat_ssl inner join pg_stat_activity on pg_stat_ssl.pid = pg_stat_activity.pid where ssl is true and usename<>'rdsadmin';
```

Only rows using SSL/TLS connections are displayed with information about the connection. The following is sample output.

```
datname | username | ssl | client_addr
-----+-----+-----+
benchdb | pgadmin | t | 53.95.6.13
postgres | pgadmin | t | 53.95.6.13
(2 rows)
```

This query displays only the current connections at the time of the query. The absence of results doesn't indicate that no applications are using SSL connections. Other SSL connections might be established at a different time.

## Determining whether a client requires certificate verification in order to connect

When a client, such as `psql` or `JDBC`, is configured with SSL support, the client first tries to connect to the database with SSL by default. If the client can't connect with SSL, it reverts to connecting without SSL. The default `sslmode` mode used is different between `libpq`-based clients (such as `psql`) and `JDBC`. The `libpq`-based clients default to `prefer`, where `JDBC` clients default to `verify-full`. The certificate on the server is verified only when `sslrootcert` is provided with `sslmode` set to `require`, `verify-ca`, or `verify-full`. An error is thrown if the certificate is invalid.

Use `PGSSLROOTCERT` to verify the certificate with the `PGSSLMODE` environment variable, with `PGSSLMODE` set to `require`, `verify-ca`, or `verify-full`.

```
PGSSLMODE=require PGSSLROOTCERT=/fullpath/rds-ca-2019-root.pem psql -h
pgdbidentifier.cxxxxxxxxx.us-east-2.rds.amazonaws.com -U masteruser -d postgres
```

Use the `sslrootcert` argument to verify the certificate with `sslmode` in connection string format, with `sslmode` set to `require`, `verify-ca`, or `verify-full` to verify the certificate.

```
psql "host=pgdbidentifier.cxxxxxxxxx.us-east-2.rds.amazonaws.com sslmode=require
sslrootcert=/full/path/rds-ca-2019-root.pem user=masteruser dbname=postgres"
```

For example, in the preceding case, if you are using an invalid root certificate, then you see an error similar to the following on your client.

```
psql: SSL error: certificate verify failed
```

## Updating your application trust store

For information about updating the trust store for PostgreSQL applications, see [Secure TCP/IP connections with SSL](#) in the PostgreSQL documentation.

### Note

When you update the trust store, you can retain older certificates in addition to adding the new certificates.

## Updating your application trust store for JDBC

You can update the trust store for applications that use JDBC for SSL/TLS connections.

### To update the trust store for JDBC applications

1. Download the 2019 root certificate that works for all AWS Regions and put the file in your trust store directory.

For information about downloading the root certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

2. Convert the certificate to .der format using the following command.

```
openssl x509 -outform der -in rds-ca-2019-root.pem -out rds-ca-2019-root.der
```

Replace the file name with the one that you downloaded.

3. Import the certificate into the key store using the following command.

```
keytool -import -alias rds-root -keystore clientkeystore -file rds-ca-2019-root.der
```

4. Confirm that the key store was updated successfully.

```
keytool -list -v -keystore clientkeystore.jks
```

Enter the key store password when you are prompted for it.

Your output should contain the following:

```
rds-root, date, trustedCertEntry,
Certificate fingerprint (SHA1):
D4:0D:DB:29:E3:75:0D:FF:A6:71:C3:14:0B:BF:5F:47:8D:1C:80:96
This fingerprint should match the output from the below command
openssl x509 -fingerprint -in rds-ca-2019-root.pem -noout
```

## Using SSL/TLS connections for different types of applications

The following provides information about using SSL/TLS connections for different types of applications:

- **psql**

The client is invoked from the command line by specifying options either as a connection string or as environment variables. For SSL/TLS connections, the relevant options are `sslmode` (environment variable `PGSSLMODE`), `sslrootcert` (environment variable `PGSSLROOTCERT`).

For the complete list of options, see [Parameter key words](#) in the PostgreSQL documentation. For the complete list of environment variables, see [Environment variables](#) in the PostgreSQL documentation.

- **pgAdmin**

This browser-based client is a more user-friendly interface for connecting to a PostgreSQL database.

For information about configuring connections, see the [pgAdmin documentation](#).

- **JDBC**

JDBC enables database connections with Java applications.

For general information about connecting to a PostgreSQL database with JDBC, see [Connecting to the database](#) in the PostgreSQL documentation. For information about connecting with SSL/TLS, see [Configuring the client](#) in the PostgreSQL documentation.

- **Python**

A popular Python library for connecting to PostgreSQL databases is `psycopg2`.

For information about using `psycopg2`, see the [psycopg2 documentation](#). For a short tutorial on how to connect to a PostgreSQL database, see [Psycopg2 tutorial](#). You can find information about the options the `connect` command accepts in [The psycopg2 module content](#).

**Important**

After you have determined that your database connections use SSL/TLS and have updated your application trust store, you can update your database to use the rds-ca-2019 certificates. For instructions, see step 3 in [Updating your CA certificate by modifying your DB instance \(p. 1674\)](#).

# Using Kerberos authentication with Amazon RDS for PostgreSQL

You can use Kerberos authentication to authenticate users when they connect to your DB instance running PostgreSQL. In this case, your DB instance works with AWS Directory Service for Microsoft Active Directory to enable Kerberos authentication. AWS Directory Service for Microsoft Active Directory is also called AWS Managed Microsoft AD.

You create an AWS Managed Microsoft AD directory to store user credentials. You then provide to your PostgreSQL DB instance the Active Directory's domain and other information. When users authenticate with the PostgreSQL DB instance, authentication requests are forwarded to the AWS Managed Microsoft AD directory.

Keeping all of your credentials in the same directory can save you time and effort. You have a centralized place for storing and managing credentials for multiple DB instances. Using a directory can also improve your overall security profile.

You can also access credentials from your own on-premises Microsoft Active Directory. To do so you create a trusting domain relationship so that the AWS Managed Microsoft AD directory trusts your on-premises Microsoft Active Directory. In this way, your users can access your PostgreSQL instances with the same Windows single sign-on (SSO) experience as when they access workloads in your on-premises network.

## Topics

- [Availability of Kerberos authentication \(p. 1558\)](#)
- [Overview of Kerberos authentication for PostgreSQL DB instances \(p. 1559\)](#)
- [Setting up Kerberos authentication for PostgreSQL DB instances \(p. 1560\)](#)
- [Managing a DB instance in a Domain \(p. 1568\)](#)
- [Connecting to PostgreSQL with Kerberos authentication \(p. 1569\)](#)

## Availability of Kerberos authentication

Amazon RDS supports Kerberos authentication for PostgreSQL DB instances in the following AWS Regions:

Region name	Region
US East (Ohio)	us-east-2
US East (N. Virginia)	us-east-1
US West (N. California)	us-west-1
US West (Oregon)	us-west-2
Asia Pacific (Mumbai)	ap-south-1
Asia Pacific (Seoul)	ap-northeast-2
Asia Pacific (Singapore)	ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2
Asia Pacific (Tokyo)	ap-northeast-1

Region name	Region
Canada (Central)	ca-central-1
China (Beijing)	cn-north-1
China (Ningxia)	cn-northwest-1
Europe (Frankfurt)	eu-central-1
Europe (Ireland)	eu-west-1
Europe (London)	eu-west-2
Europe (Paris)	eu-west-3
Europe (Stockholm)	eu-north-1
South America (São Paulo)	sa-east-1
AWS GovCloud (US-East)	gov-us-east-1
AWS GovCloud (US-West)	gov-us-west-1

## Overview of Kerberos authentication for PostgreSQL DB instances

To set up Kerberos authentication for a PostgreSQL DB instance, take the following steps, described in more detail later:

1. Use AWS Managed Microsoft AD to create an AWS Managed Microsoft AD directory. You can use the AWS Management Console, the AWS CLI, or the AWS Directory Service API to create the directory. Make sure to open the relevant outbound ports on the directory security group so that the directory can communicate with the instance.
2. Create a role that provides Amazon RDS access to make calls to your AWS Managed Microsoft AD directory. To do so, create an AWS Identity and Access Management (IAM) role that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess`.

For the IAM role to allow access, the AWS Security Token Service (AWS STS) endpoint must be activated in the correct AWS Region for your AWS account. AWS STS endpoints are active by default in all AWS Regions, and you can use them without any further actions. For more information, see [Activating and deactivating AWS STS in an AWS Region](#) in the *IAM User Guide*.

3. Create and configure users in the AWS Managed Microsoft AD directory using the Microsoft Active Directory tools. For more information about creating users in your Active Directory, see [Manage users and groups in AWS Managed Microsoft AD](#) in the *AWS Directory Service Administration Guide*.
4. If you plan to locate the directory and the DB instance in different AWS accounts or virtual private clouds (VPCs), configure VPC peering. For more information, see [What is VPC peering?](#) in the *Amazon VPC Peering Guide*.
5. Create or modify a PostgreSQL DB instance either from the console, CLI, or RDS API using one of the following methods:
  - [Creating an Amazon RDS DB instance \(p. 140\)](#)
  - [Modifying an Amazon RDS DB instance \(p. 251\)](#)
  - [Restoring from a DB snapshot \(p. 352\)](#)
  - [Restoring a DB instance to a specified time \(p. 392\)](#)

You can locate the instance in the same Amazon Virtual Private Cloud (VPC) as the directory or in a different AWS account or VPC. When you create or modify the PostgreSQL DB instance, do the following:

- Provide the domain identifier (d-\* identifier) that was generated when you created your directory.
  - Provide the name of the IAM role that you created.
  - Ensure that the DB instance security group can receive inbound traffic from the directory security group.
6. Use the RDS master user credentials to connect to the PostgreSQL DB instance. Create the user in PostgreSQL to be identified externally. Externally identified users can log in to the PostgreSQL DB instance using Kerberos authentication.

## Setting up Kerberos authentication for PostgreSQL DB instances

You use AWS Directory Service for Microsoft Active Directory (AWS Managed Microsoft AD) to set up Kerberos authentication for a PostgreSQL DB instance. To set up Kerberos authentication, take the following steps.

### Topics

- [Step 1: Create a directory using AWS Managed Microsoft AD \(p. 1560\)](#)

### Step 1: Create a directory using AWS Managed Microsoft AD

AWS Directory Service creates a fully managed Active Directory in the AWS Cloud. When you create an AWS Managed Microsoft AD directory, AWS Directory Service creates two domain controllers and DNS servers for you. The directory servers are created in different subnets in a VPC. This redundancy helps make sure that your directory remains accessible even if a failure occurs.

When you create an AWS Managed Microsoft AD directory, AWS Directory Service performs the following tasks on your behalf:

- Sets up an Active Directory within your VPC.
- Creates a directory administrator account with the user name `Admin` and the specified password. You use this account to manage your directory.

#### Important

Make sure to save this password. AWS Directory Service doesn't store this password, and it can't be retrieved or reset.

- Creates a security group for the directory controllers. The security group must permit communication with the PostgreSQL DB instance.

When you launch AWS Directory Service for Microsoft Active Directory, AWS creates an Organizational Unit (OU) that contains all of your directory's objects. This OU, which has the NetBIOS name that you entered when you created your directory, is located in the domain root. The domain root is owned and managed by AWS.

The **Admin** account that was created with your AWS Managed Microsoft AD directory has permissions for the most common administrative activities for your OU:

- Create, update, or delete users
- Add resources to your domain such as file or print servers, and then assign permissions for those resources to users in your OU
- Create additional OUs and containers
- Delegate authority
- Restore deleted objects from the Active Directory Recycle Bin
- Run Active Directory and Domain Name Service (DNS) modules for Windows PowerShell on the Active Directory Web Service

The **Admin** account also has rights to perform the following domain-wide activities:

- Manage DNS configurations (add, remove, or update records, zones, and forwarders)
- View DNS event logs
- View security event logs

## To create a directory with AWS Managed Microsoft AD

1. In the [AWS Directory Service console](#) navigation pane, choose **Directories**, and then choose **Set up directory**.
2. Choose **AWS Managed Microsoft AD**. AWS Managed Microsoft AD is the only option currently supported for use with Amazon RDS.
3. Choose **Next**.
4. On the **Enter directory information** page, provide the following information:

### **Edition**

Choose the edition that meets your requirements.

### **Directory DNS name**

The fully qualified name for the directory, such as **corp.example.com**.

### **Directory NetBIOS name**

An optional short name for the directory, such as **CORP**.

### **Directory description**

An optional description for the directory.

### **Admin password**

The password for the directory administrator. The directory creation process creates an administrator account with the user name **Admin** and this password.

The directory administrator password can't include the word "admin." The password is case-sensitive and must be 8–64 characters in length. It must also contain at least one character from three of the following four categories:

- Lowercase letters (a–z)
- Uppercase letters (A–Z)
- Numbers (0–9)
- Nonalphanumeric characters (~!@#\$%^&\*\_-+=`|\{}{};;"'<>,.?/)

## Confirm password

Retype the administrator password.

### Important

Make sure that you save this password. AWS Directory Service doesn't store this password, and it can't be retrieved or reset.

5. Choose **Next**.
6. On the **Choose VPC and subnets** page, provide the following information:

### VPC

Choose the VPC for the directory. You can create the PostgreSQL DB instance in this same VPC or in a different VPC.

### Subnets

Choose the subnets for the directory servers. The two subnets must be in different Availability Zones.

7. Choose **Next**.
8. Review the directory information. If changes are needed, choose **Previous** and make the changes. When the information is correct, choose **Create directory**.

## Review & create

### Review

Directory type	VPC
Microsoft AD	vpc-8b6b78e9 ( [REDACTED] )
Directory DNS name	Subnets
corp.example.com	subnet-75128d10 ( [REDACTED], us-east-1a ) subnet-f51665dd ( [REDACTED], us-east-1b )
Directory NetBIOS name	
CORP	
Directory description	
My directory	

### Pricing

Edition	Free trial eligible <a href="#">Learn more</a>
Standard	30-day limited trial

~USD [REDACTED] \*  
\* Includes two domain controllers, USD [REDACTED] /mo for each additional domain controller.

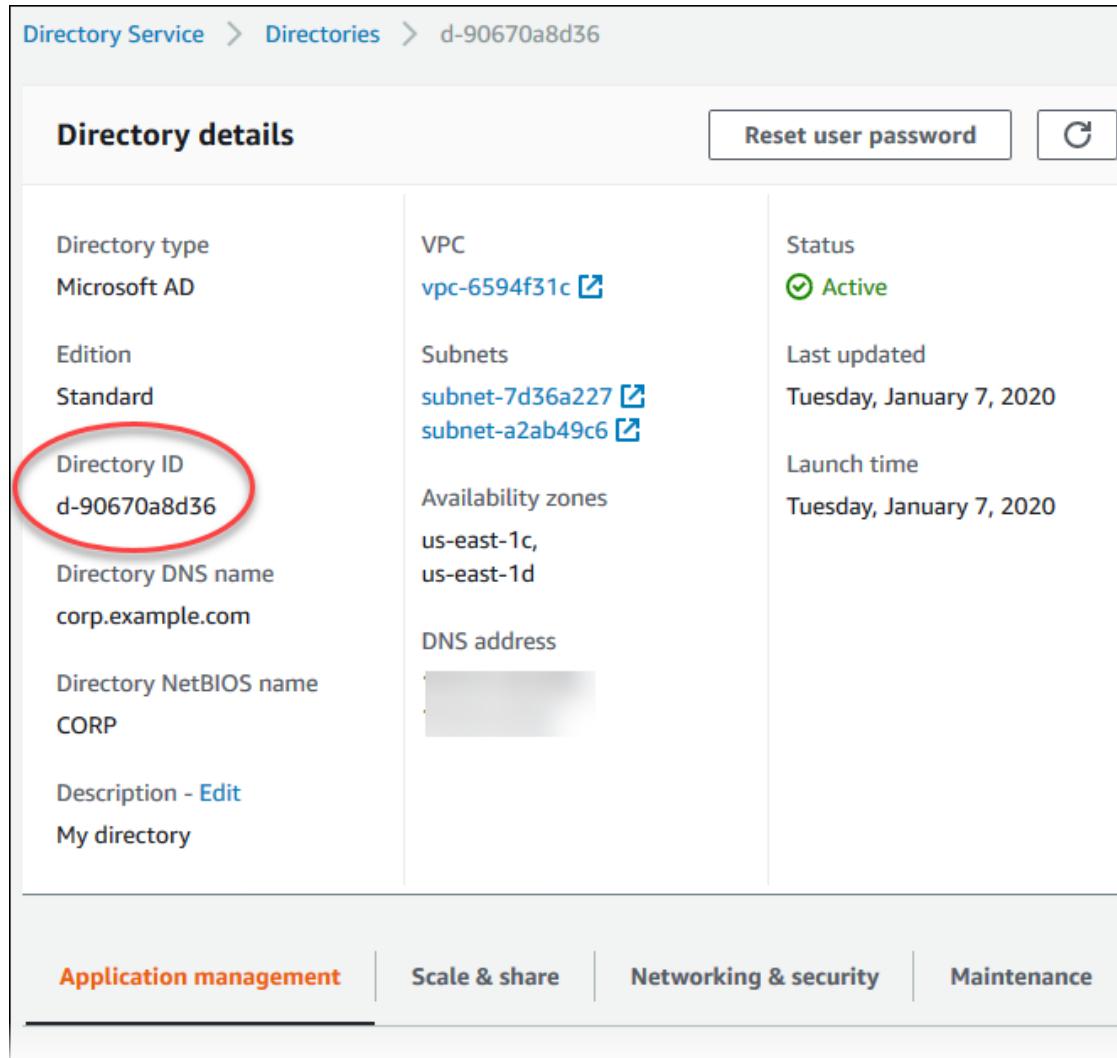

Cancel

Previous

Create directory

It takes several minutes for the directory to be created. When it has been successfully created, the **Status** value changes to **Active**.

To see information about your directory, choose the directory ID in the directory listing. Make a note of the **Directory ID** value. You need this value when you create or modify your PostgreSQL DB instance.

The screenshot shows the 'Directories' page in the AWS Management Console. The URL in the top navigation bar is 'Directory Service > Directories > d-90670a8d36'. The main content area is titled 'Directory details' and contains the following information:

Setting	Value	Details
Directory type	VPC	Status
Microsoft AD	vpc-6594f31c	Active
Edition	Standard	Subnets
Directory ID	d-90670a8d36	subnet-7d36a227 subnet-a2ab49c6
Directory DNS name	corp.example.com	Last updated
Directory NetBIOS name	CORP	Tuesday, January 7, 2020
Description - Edit	My directory	Launch time
		Tuesday, January 7, 2020
		Availability zones
		us-east-1c, us-east-1d
		DNS address

At the bottom of the page, there are four tabs: 'Application management' (highlighted in orange), 'Scale & share', 'Networking & security', and 'Maintenance'.

## Step 2: (Optional) create a trust for an on-premises Active Directory

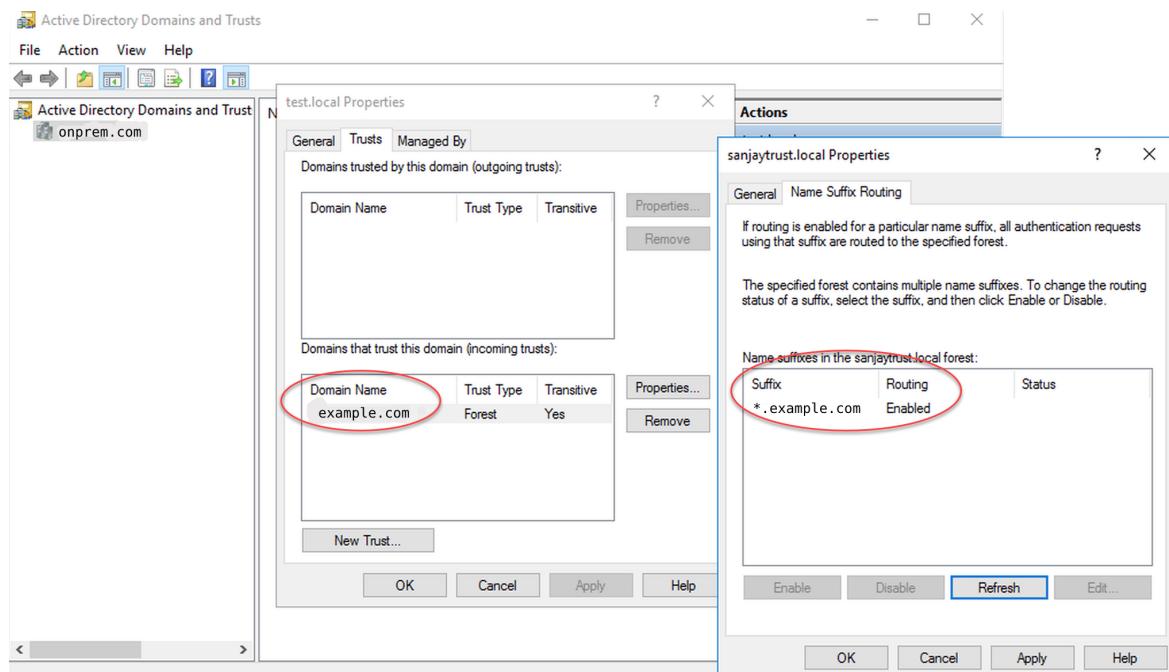

If you don't plan to use your own on-premises Microsoft Active Directory, skip to [Step 3: Create an IAM role for Amazon RDS to access the AWS Directory Service \(p. 1564\)](#).

To get Kerberos authentication using your on-premises Active Directory, you need to create a trusting domain relationship using a forest trust between your on-premises Microsoft Active Directory and the AWS Managed Microsoft AD directory (created in [Step 1: Create a directory using AWS Managed Microsoft AD \(p. 1560\)](#)). The trust can be one-way, where the AWS Managed Microsoft AD directory trusts the on-premises Microsoft Active Directory. The trust can also be two-way, where both Active Directories trust each other. For more information about setting up trusts using AWS Directory Service, see [When to create a trust relationship in the AWS Directory Service Administration Guide](#).

### Note

If you use an on-premises Microsoft Active Directory, DB instance endpoints can't be used by Windows clients.

Make sure that your on-premises Microsoft Active Directory domain name includes a DNS suffix routing that corresponds to the newly created trust relationship. The following screenshot shows an example.

### Step 3: Create an IAM role for Amazon RDS to access the AWS Directory Service

For Amazon RDS to call AWS Directory Service for you, an IAM role that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess` is required. This role allows Amazon RDS to make calls to AWS Directory Service.

When a DB instance is created using the AWS Management Console and the console user has the `iam:CreateRole` permission, the console creates this role automatically. In this case, the role name is `rds-directoryservice-kerberos-access-role`. Otherwise, create the IAM role manually. Choose **RDS** and then **RDS - Directory Service**. Attach the AWS managed policy `AmazonRDSDirectoryServiceAccess` to this role.

For more information about creating IAM roles for a service, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.

#### Note

The IAM role used for Windows Authentication for RDS for Microsoft SQL Server can't be used for Amazon RDS for PostgreSQL.

Optionally, you can create policies with the required permissions instead of using the managed IAM policy `AmazonRDSDirectoryServiceAccess`. In this case, the IAM role must have the following IAM trust policy.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "",
 "Effect": "Allow",
 "Principal": {
 "Service": [
 "directoryservice.rds.amazonaws.com",
 "rds.amazonaws.com"
]
 },
 "Action": "sts:AssumeRole"
 }
]
}
```

```
]
 }
```

The role must also have the following IAM role policy.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Action": [
 "ds:DescribeDirectories",
 "ds:AuthorizeApplication",
 "ds:UnauthorizeApplication",
 "ds:GetAuthorizedApplicationDetails"
],
 "Effect": "Allow",
 "Resource": "*"
 }
]
}
```

## Step 4: Create and configure users

You can create users by using the Active Directory Users and Computers tool. This is one of the Active Directory Domain Services and Active Directory Lightweight Directory Services tools. In this case, *users* are individual people or entities who have access to your directory.

To create users in an AWS Directory Service directory, you must be connected to a Windows-based Amazon EC2 instance. Also, this EC2 instance must be a member of the AWS Directory Service directory. At the same time, you must be logged in as a user that has privileges to create users. For more information, see [Create a user in the AWS Directory Service Administration Guide](#).

## Step 5: Enable cross-VPC traffic between the directory and the DB instance

If you plan to locate the directory and the DB instance in the same VPC, skip this step and move on to [Step 6: Create or modify a PostgreSQL DB instance \(p. 1566\)](#).

If you plan to locate the directory and the DB instance in different VPCs, configure cross-VPC traffic using VPC peering or [AWS Transit Gateway](#).

The following procedure enables traffic between VPCs using VPC peering. Follow the instructions in [What is VPC peering?](#) in the *Amazon Virtual Private Cloud Peering Guide*.

### To enable cross-VPC traffic using VPC peering

1. Set up appropriate VPC routing rules to ensure that network traffic can flow both ways.
2. Ensure that the DB instance security group can receive inbound traffic from the directory security group.
3. Ensure that there is no network access control list (ACL) rule to block traffic.

If a different AWS account owns the directory, you must share the directory.

### To share the directory between AWS accounts

1. Start sharing the directory with the AWS account that the DB instance will be created in by following the instructions in [Tutorial: Sharing your AWS Managed Microsoft AD directory for seamless EC2 Domain-join](#) in the *AWS Directory Service Administration Guide*.

2. Sign in to the AWS Directory Service console using the account for the DB instance, and ensure that the domain has the **SHARED** status before proceeding.
3. While signed into the AWS Directory Service console using the account for the DB instance, note the **Directory ID** value. You use this directory ID to join the DB instance to the domain.

## Step 6: Create or modify a PostgreSQL DB instance

Create or modify a PostgreSQL DB instance for use with your directory. You can use the console, CLI, or RDS API to associate a DB instance with a directory. You can do this in one of the following ways:

- Create a new PostgreSQL DB instance using the console, the [create-db-instance](#) CLI command, or the [CreateDBInstance](#) RDS API operation. For instructions, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- Modify an existing PostgreSQL DB instance using the console, the [modify-db-instance](#) CLI command, or the [ModifyDBInstance](#) RDS API operation. For instructions, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- Restore a PostgreSQL DB instance from a DB snapshot using the console, the [restore-db-instance-from-db-snapshot](#) CLI command, or the [RestoreDBInstanceFromDBSnapshot](#) RDS API operation. For instructions, see [Restoring from a DB snapshot \(p. 352\)](#).
- Restore a PostgreSQL DB instance to a point-in-time using the console, the [restore-db-instance-to-point-in-time](#) CLI command, or the [RestoreDBInstanceToPointInTime](#) RDS API operation. For instructions, see [Restoring a DB instance to a specified time \(p. 392\)](#).

Kerberos authentication is only supported for PostgreSQL DB instances in a VPC. The DB instance can be in the same VPC as the directory, or in a different VPC. The DB instance must use a security group that allows ingress and egress within the directory's VPC so the DB instance can communicate with the directory.

### Console

When you use the console to create, modify, or restore a DB instance, choose **Password and Kerberos authentication** in the **Database authentication** section. Then choose **Browse Directory**. Select the directory or choose **Create a new directory** to use the Directory Service.

### AWS CLI

When you use the AWS CLI, the following parameters are required for the DB instance to be able to use the directory that you created:

- For the `--domain` parameter, use the domain identifier ("d-*identifier*") generated when you created the directory.
- For the `--domain-iam-role-name` parameter, use the role you created that uses the managed IAM policy `AmazonRDSDirectoryServiceAccess`.

For example, the following CLI command modifies a DB instance to use a directory.

```
aws rds modify-db-instance --db-instance-identifier mydbinstance --domain d-Directory-ID --domain-iam-role-name role-name
```

#### Important

If you modify a DB instance to enable Kerberos authentication, reboot the DB instance after making the change.

## Step 7: Create Kerberos authentication PostgreSQL logins

Use the RDS master user credentials to connect to the PostgreSQL DB instance as you do with any other DB instance. The DB instance is joined to the AWS Managed Microsoft AD domain. Thus, you can provision PostgreSQL logins and users from the Microsoft Active Directory users and groups in your domain. To manage database permissions, you grant and revoke standard PostgreSQL permissions to these logins.

To allow an Active Directory user to authenticate with PostgreSQL, use the RDS master user credentials. You use these credentials to connect to the PostgreSQL DB instance as you do with any other DB instance. After you're logged in, create an externally authenticated user in PostgreSQL and grant the `rds_ad` role to this user.

```
CREATE USER "username@CORP.EXAMPLE.COM" WITH LOGIN;
GRANT rds_ad TO "username@CORP.EXAMPLE.COM";
```

Replace `username` with the user name and include the domain name in uppercase. Users (both humans and applications) from your domain can now connect to the RDS PostgreSQL instance from a domain-joined client machine using Kerberos authentication.

Note that a database user can use either Kerberos or IAM authentication but not both, so this user can't also have the `rds_iam` role. This also applies to nested memberships. For more information, see [IAM database authentication for MySQL and PostgreSQL \(p. 1698\)](#).

## Step 8: Configure a PostgreSQL client

To configure a PostgreSQL client, take the following steps:

- Create a `krb5.conf` file (or equivalent) to point to the domain.
- Verify that traffic can flow between the client host and AWS Directory Service. Use a network utility such as Netcat for the following:
  - Verify traffic over DNS for port 53.
  - Verify traffic over TCP/UDP for port 53 and for Kerberos, which includes ports 88 and 464 for AWS Directory Service.
- Verify that traffic can flow between the client host and the DB instance over the database port. For example, use `psql` to connect and access the database.

The following is sample `krb5.conf` content for AWS Managed Microsoft AD.

```
[libdefaults]
default_realm = EXAMPLE.COM
[realms]
EXAMPLE.COM = {
 kdc = example.com
 admin_server = example.com
}
[domain_realm]
.example.com = EXAMPLE.COM
example.com = EXAMPLE.COM
```

The following is sample `krb5.conf` content for an on-premises Microsoft Active Directory.

```
[libdefaults]
default_realm = EXAMPLE.COM
[realms]
EXAMPLE.COM = {
```

```
kdc = example.com
admin_server = example.com
}
ONPREM.COM = {
 kdc = onprem.com
 admin_server = onprem.com
}
[domain_realm]
.example.com = EXAMPLE.COM
example.com = EXAMPLE.COM
.onprem.com = ONPREM.COM
onprem.com = ONPREM.COM
.rds.amazonaws.com = EXAMPLE.COM
.amazonaws.com.cn = EXAMPLE.COM
.amazon.com = EXAMPLE.COM
```

## Managing a DB instance in a Domain

You can use the console, the CLI, or the RDS API to manage your DB instance and its relationship with your Microsoft Active Directory. For example, you can associate an Active Directory to enable Kerberos authentication. You can also remove the association for an Active Directory to disable Kerberos authentication. You can also move a DB instance to be externally authenticated by one Microsoft Active Directory to another.

For example, using the CLI, you can do the following:

- To reattempt enabling Kerberos authentication for a failed membership, use the [modify-db-instance](#) CLI command. Specify the current membership's directory ID for the `--domain` option.
- To disable Kerberos authentication on a DB instance, use the [modify-db-instance](#) CLI command. Specify `none` for the `--domain` option.
- To move a DB instance from one domain to another, use the [modify-db-instance](#) CLI command. Specify the domain identifier of the new domain for the `--domain` option.

## Understanding Domain membership

After you create or modify your DB instance, it becomes a member of the domain. You can view the status of the domain membership in the console or by running the [describe-db-instances](#) CLI command. The status of the DB instance can be one of the following:

- `kerberos-enabled` – The DB instance has Kerberos authentication enabled.
- `enabling-kerberos` – AWS is in the process of enabling Kerberos authentication on this DB instance.
- `pending-enable-kerberos` – Enabling Kerberos authentication is pending on this DB instance.
- `pending-maintenance-enable-kerberos` – AWS will attempt to enable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- `pending-disable-kerberos` – Disabling Kerberos authentication is pending on this DB instance.
- `pending-maintenance-disable-kerberos` – AWS will attempt to disable Kerberos authentication on the DB instance during the next scheduled maintenance window.
- `enable-kerberos-failed` – A configuration problem prevented AWS from enabling Kerberos authentication on the DB instance. Correct the configuration problem before reissuing the command to modify the DB instance.
- `disabling-kerberos` – AWS is in the process of disabling Kerberos authentication on this DB instance.

A request to enable Kerberos authentication can fail because of a network connectivity issue or an incorrect IAM role. In some cases, the attempt to enable Kerberos authentication might fail when you

create or modify a DB instance. If so, make sure that you are using the correct IAM role, then modify the DB instance to join the domain.

**Note**

Only Kerberos authentication with RDS for PostgreSQL sends traffic to the domain's DNS servers. All other DNS requests are treated as outbound network access on your DB instances running PostgreSQL. For more information about outbound network access with RDS for PostgreSQL, see [Using a custom DNS server for outbound network access \(p. 1643\)](#).

## Connecting to PostgreSQL with Kerberos authentication

You can connect to PostgreSQL with Kerberos authentication with the pgAdmin interface or with a command line interface such as psql. For more information about connecting, see [Connecting to a DB instance running the PostgreSQL database engine \(p. 1546\)](#).

### pgAdmin

To use pgAdmin to connect to PostgreSQL with Kerberos authentication, take the following steps:

1. Launch the pgAdmin application on your client computer.
2. On the **Dashboard** tab, choose **Add New Server**.
3. In the **Create - Server** dialog box, enter a name on the **General** tab to identify the server in pgAdmin.
4. On the **Connection** tab, enter the following information from your RDS for PostgreSQL database:
  - For **Host**, enter the endpoint. Use a format such as *PostgreSQL-endpoint.AWS-Region.rds.amazonaws.com*.

If you're using an on-premises Microsoft Active Directory from a Windows client, then you need to connect using a specialized endpoint. Instead of using the Amazon domain `rds.amazonaws.com` in the host endpoint, use the domain name of the AWS Managed Active Directory.

For example, suppose that the domain name for the AWS Managed Active Directory is `corp.example.com`. Then for **Host**, use the format *PostgreSQL-endpoint.AWS-Region.corp.example.com*.

- For **Port**, enter the assigned port.
- For **Maintenance database**, enter the name of the initial database to which the client will connect.
- For **Username**, enter the user name that you entered for Kerberos authentication in [Step 7: Create Kerberos authentication PostgreSQL logins \(p. 1567\)](#).

5. Choose **Save**.

### PsSql

To use psql to connect to PostgreSQL with Kerberos authentication, take the following steps:

1. At a command prompt, run the following command.

```
kinit username
```

Replace *username* with the user name. At the prompt, enter the password stored in the Microsoft Active Directory for the user.

2. If the PostgreSQL DB instance is using a publicly accessible VPC, put a private IP address for your DB instance endpoint in your `/etc/hosts` file on the EC2 client. For example, the following commands obtain the private IP address and then put it in the `/etc/hosts` file.

```
% dig +short PostgreSQL-endpoint.AWS-Region.rds.amazonaws.com
;; Truncated, retrying in TCP mode.
```

```
ec2-34-210-197-118.AWS-Region.compute.amazonaws.com.
34.210.197.118
% echo " 34.210.197.118 PostgreSQL-endpoint.AWS-Region.rds.amazonaws.com" >> /etc/hosts
```

If you're using an on-premises Microsoft Active Directory from a Windows client, then you need to connect using a specialized endpoint. Instead of using the Amazon domain `rds.amazonaws.com` in the host endpoint, use the domain name of the AWS Managed Active Directory.

For example, suppose that the domain name for your AWS Managed Active Directory is `corp.example.com`. Then use the format `PostgreSQL-endpoint.AWS-Region.corp.example.com` for the endpoint and put it in the `/etc/hosts` file.

```
% echo " 34.210.197.118 PostgreSQL-endpoint.AWS-Region.corp.example.com" >> /etc/hosts
```

3. Use the following `psql` command to log in to a PostgreSQL DB instance that is integrated with Active Directory.

```
psql -U username@CORP.EXAMPLE.COM -p 5432 -h PostgreSQL-endpoint.AWS-Region.rds.amazonaws.com postgres
```

To log in to the PostgreSQL DB cluster from a Windows client using an on-premises Active Directory, use the following `psql` command with the domain name from the previous step (`corp.example.com`):

```
psql -U username@CORP.EXAMPLE.COM -p 5432 -h PostgreSQL-endpoint.AWS-Region.corp.example.com postgres
```

# Upgrading the PostgreSQL DB engine for Amazon RDS

There are two types of upgrades you can manage for your PostgreSQL DB instance:

- Operating system updates – Occasionally, Amazon RDS might need to update the underlying operating system of your DB instance to apply security fixes or OS changes. You can decide when Amazon RDS applies OS updates by using the RDS console, AWS Command Line Interface (AWS CLI), or RDS API. For more information about OS updates, see [Applying updates for a DB instance \(p. 267\)](#).
- Database engine upgrades – When Amazon RDS supports a new version of a database engine, you can upgrade your DB instances to the new version.

When Amazon RDS supports a new version of a database engine, you can upgrade your DB instances to the new version. There are two kinds of upgrades for PostgreSQL DB instances: major version upgrades and minor version upgrades.

## Major version upgrades

*Major version upgrades* can contain database changes that are not backward-compatible with existing applications. As a result, you must manually perform major version upgrades of your DB instances. You can initiate a major version upgrade by modifying your DB instance. However, before you perform a major version upgrade, we recommend that you follow the steps described in [Choosing a major version upgrade for PostgreSQL \(p. 1572\)](#). During a major version upgrade, Amazon RDS also upgrades all of your in-Region read replicas along with the primary DB instance.

## Minor version upgrades

In contrast, *minor version upgrades* include only changes that are backward-compatible with existing applications. You can initiate a minor version upgrade manually by modifying your DB instance. Or you can enable the **Auto minor version upgrade** option when creating or modifying a DB instance. Doing so means that your DB instance is automatically upgraded after Amazon RDS tests and approves the new version. If your PostgreSQL DB instance is using read replicas, you must upgrade all of the read replicas before the minor version upgrade of the source instance. For more details, see [Automatic minor version upgrades for PostgreSQL \(p. 1578\)](#). For information about manually performing a minor version upgrade, see [Manually upgrading the engine version \(p. 272\)](#).

## Topics

- [Overview of upgrading PostgreSQL \(p. 1571\)](#)
- [PostgreSQL version numbers \(p. 1572\)](#)
- [Choosing a major version upgrade for PostgreSQL \(p. 1572\)](#)
- [How to perform a major version upgrade \(p. 1574\)](#)
- [Automatic minor version upgrades for PostgreSQL \(p. 1578\)](#)
- [Upgrading PostgreSQL extensions \(p. 1578\)](#)

## Overview of upgrading PostgreSQL

To safely upgrade your DB instances, Amazon RDS uses the `pg_upgrade` utility described in the [PostgreSQL documentation](#).

Amazon RDS takes two DB snapshots during the upgrade process if your backup retention period is greater than 0. The first DB snapshot is of the DB instance before any upgrade changes have been made.

If the upgrade doesn't work for your databases, you can restore this snapshot to create a DB instance running the old version. The second DB snapshot is taken after the upgrade completes.

**Note**

Amazon RDS takes DB snapshots during the upgrade process only if you have set the backup retention period for your DB instance to a number greater than 0. To change your backup retention period, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

When you upgrade the primary DB instance, all the in-Region read replicas are also automatically upgraded. After the upgrade workflow starts, the replica instances wait for the `pg_upgrade` to complete successfully on the primary DB instance. Then the primary instance upgrade waits for the replica instance upgrades to complete. You experience an outage until the upgrade is complete. If you have any older replicas from earlier major versions they aren't upgraded.

If your DB instance is in a Multi-AZ deployment, both the primary writer DB instance and standby DB instances are upgraded. The writer and standby DB instances are upgraded at the same time.

After an upgrade is complete, you can't revert to the previous version of the database engine. If you want to return to the previous version, restore the DB snapshot that was taken before the upgrade to create a new DB instance.

## PostgreSQL version numbers

The version numbering sequence for the PostgreSQL database engine is as follows:

- For PostgreSQL versions 10 and later, the engine version number is in the form *major.minor*. The major version number is the integer part of the version number. The minor version number is the fractional part of the version number.

A major version upgrade increases the integer part of the version number, such as upgrading from *10.minor* to *11.minor*.

- For PostgreSQL versions earlier than 10, the engine version number is in the form *major.major.minor*. The major engine version number is both the integer and the first fractional part of the version number. For example, 9.6 is a major version. The minor version number is the third part of the version number. For example, for version 9.6.12, the 12 is the minor version number.

A major version upgrade increases the major part of the version number. For example, an upgrade from 9.6.12 to 10.11 is a major version upgrade, where 9.6 and 10 are the major version numbers.

## Choosing a major version upgrade for PostgreSQL

Major version upgrades can contain database changes that are not backward-compatible with previous versions of the database. This functionality can cause your existing applications to stop working correctly.

As a result, Amazon RDS doesn't apply major version upgrades automatically. To perform a major version upgrade, you modify your DB instance manually. Make sure that you thoroughly test any upgrade to verify that your applications work correctly before applying the upgrade to your production DB instances. When you do a PostgreSQL major version upgrade, we recommend that you follow the steps described in [How to perform a major version upgrade \(p. 1574\)](#).

You can upgrade a PostgreSQL database to its next major version. From some PostgreSQL database versions, you can skip to a higher major version when upgrading. If your upgrade skips a major version, the read replicas are also upgraded to that target major version. The following table lists the source PostgreSQL database versions and the associated target major versions available for upgrading.

**Note**

Upgrade targets are enabled to a higher version released at the same time as the source minor version or later.

If a database uses the `PostGIS` extension, you can't skip major versions for some source to target combinations. For these circumstances, upgrade to a recent minor version, then upgrade to PostgreSQL 12, and finally upgrade to your desired target version.

The `pgRouting` extension isn't supported for an upgrade that skips a major version to versions 11.x. A major version is skipped when the upgrade goes from versions 9.4.x, 9.5.x, or 9.6.x to versions 11.x. You can drop the `pgRouting` extension and then add it again after an upgrade. The `tsearch2` and `chkpass` extensions aren't supported in PostgreSQL 11 or later. If you are upgrading to version 11.x, drop these extensions before the upgrade.

Current source version	Newest upgrade target	Preferred major upgrade targets			
12.6, 12.5, 12.4, 12.3, 12.2	<a href="#">13.2 (p. 1499)</a>	<a href="#">13.2 (p. 1499)</a>			
11.11	<a href="#">13.2 (p. 1499)</a>	<a href="#">13.2 (p. 1499)</a>	<a href="#">12.6 (p. 1500)</a>		
11.10	<a href="#">13.1 (p. 1499)</a>	<a href="#">13.1 (p. 1499)</a>	<a href="#">12.6 (p. 1500)</a>	<a href="#">11.11 (p. 1501)</a>	
11.9, 11.8, 11.7, 11.6, 11.5, 11.4, 11.2, 11.1	<a href="#">12.6 (p. 1500)</a>		<a href="#">12.6 (p. 1500)</a>	<a href="#">11.11 (p. 1501)</a>

To get a list of all valid upgrade targets for a current source version, use the [describe-db-engine-versions](#) CLI command. For example:

```
export REGION=AWS-Region
export ENDPOINT=https://rds.AWS-Region.amazonaws.com

aws rds describe-db-engine-versions --engine postgres --region $REGION --endpoint
$ENDPOINT --output text --query '*[].ValidUpgradeTarget[?IsMajorVersionUpgrade==`true`].
{EngineVersion:EngineVersion}' --engine-version DB-current-version
```

## How to perform a major version upgrade

We recommend the following process when upgrading an Amazon RDS PostgreSQL DB instance:

1. **Have a version-compatible parameter group ready** – If you are using a custom parameter group, you have two options. You can specify a default parameter group for the new DB engine version. Or you can create your own custom parameter group for the new DB engine version.

If you associate a new parameter group with a DB instance, reboot the database after the upgrade completes. If the instance needs to be rebooted to apply the parameter group changes, the instance's parameter group status shows `pending-reboot`. You can view an instance's parameter group status in the console or by using a `describe` command, such as [describe-db-instances](#).

2. **Check for unsupported DB instance classes** – Check that your database's instance class is compatible with the PostgreSQL version you are upgrading to. For more information, see [Supported DB engines for DB instance classes \(p. 8\)](#).
3. **Check for unsupported usage:**
  - **Prepared transactions** – Commit or roll back all open prepared transactions before attempting an upgrade.

You can use the following query to verify that there are no open prepared transactions on your instance.

```
SELECT count(*) FROM pg_catalog.pg_prepared_xacts;
```

- **Reg\* data types** – Remove all uses of the *reg\** data types before attempting an upgrade. Except for `regtype` and `regclass`, you can't upgrade the *reg\** data types. The `pg_upgrade` utility can't persist this data type, which is used by Amazon RDS to do the upgrade.

To verify that there are no uses of unsupported *reg\** data types, use the following query for each database.

```
SELECT count(*) FROM pg_catalog.pg_class c, pg_catalog.pg_namespace n,
pg_catalog.pg_attribute a
WHERE c.oid = a.attrelid
AND NOT a.attisdropped
AND a.atttypid IN ('pg_catalog.regproc'::pg_catalog.regtype,
'pg_catalog.regprocedure'::pg_catalog.regtype,
'pg_catalog.regoper'::pg_catalog.regtype,
'pg_catalog.regoperator'::pg_catalog.regtype,
'pg_catalog.regconfig'::pg_catalog.regtype,
'pg_catalog.regdictionary'::pg_catalog.regtype)
AND c.relnamespace = n.oid
AND n.nspname NOT IN ('pg_catalog', 'information_schema');
```

4. **Handle read replicas** – An upgrade also upgrades the in-Region read replicas along with the primary instance.

You can't upgrade read replicas separately. If you could, it could lead to situations where the primary and replica instances have different PostgreSQL major versions. However, replica upgrades might increase downtime on the primary instance. To prevent a replica upgrade, promote the replica to a standalone instance or delete it before starting the upgrade process.

The upgrade process recreates the replica's parameter group based on the replica instance's current parameter group. You can apply a custom parameter group to a replica only after the upgrade completes by using the [modify-db-parameter-group](#) CLI command.

Read replicas on the virtual private cloud (VPC) platform are upgraded but replicas on the EC2-Classic platform aren't upgraded. Any EC2-Classic replicas are left in the replication terminated state after the upgrade process completes. To move a DB instance from the EC2-Classic platform into a VPC, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#). For more information, see [Working with PostgreSQL read replicas in Amazon RDS \(p. 1582\)](#).

5. **Perform a backup** – We recommend that you perform a backup before performing the major version upgrade so that you have a known restore point for your database. If your backup retention period is greater than 0, the upgrade process creates DB snapshots of your DB instance before and after upgrading. To change your backup retention period, see [Modifying an Amazon RDS DB instance \(p. 251\)](#). To perform a backup manually, see [Creating a DB snapshot \(p. 349\)](#).
6. **Upgrade certain extensions before the major version upgrade** – If you plan to skip a major version with the upgrade, you need to update certain extensions *before* performing the major version

upgrade. Upgrading from versions 9.4.x, 9.5.x, or 9.6.x to versions 11.x skip a major version. The extensions to update include:

- address\_standardizer
- address\_standardizer\_data\_us
- postGIS
- postgis\_tiger\_geocoder
- postgis\_topology

Run the following command for each extension you are using.

```
ALTER EXTENSION PostgreSQL-extension UPDATE TO 'new-version'
```

For more information, see [Upgrading PostgreSQL extensions \(p. 1578\)](#).

7. **Drop certain extensions before the major version upgrade** – An upgrade that skips a major version to version 11.x doesn't support updating the pgRouting extension. Upgrading from versions 9.4.x, 9.5.x, or 9.6.x to versions 11.x skip a major version. It's safe to drop the pgRouting extension and then reinstall it to a compatible version after the upgrade. For the extension versions you can update to, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

The tsearch2 and chkpass extensions are no longer supported for PostgreSQL versions 11 or later. If you are upgrading to version 11.x, drop the tsearch2, and chkpass extensions before the upgrade.

8. **Drop unknown data types** – Drop unknown data types depending on the target version.

PostgreSQL version 10 stopped supporting the unknown data type. If a version 9.6 database uses the unknown data type, an upgrade to a version 10 shows an error message such as the following:

```
Database instance is in a state that cannot be upgraded: PreUpgrade checks failed:
The instance could not be upgraded because the 'unknown' data type is used in user
tables.
Please remove all usages of the 'unknown' data type and try again."
```

To find the unknown data type in your database so you can remove the offending column or change it to a supported data type, use the following SQL:

```
SELECT DISTINCT data_type FROM information_schema.columns WHERE data_type ILIKE
'unknown';
```

9. **Perform an upgrade dry run** – We highly recommend testing a major version upgrade on a duplicate of your production database before attempting the upgrade on your production database. To create a duplicate test instance, you can either restore your database from a recent snapshot or do a point-in-time restore of your database to its latest restorable time. For more information, see [Restoring from a snapshot \(p. 353\)](#) or [Restoring a DB instance to a specified time \(p. 392\)](#). For details on performing the upgrade, see [Manually upgrading the engine version \(p. 272\)](#).

During the major version upgrade, the public and template1 databases and the public schema in every database on the instance are temporarily renamed. These objects appear in the logs with their original name and a random string appended. The string is appended so that custom settings such as locale and owner are preserved during the major version upgrade. After the upgrade completes, the objects are renamed back to their original names.

#### Note

During the major version upgrade process, you can't do a point-in-time restore of your instance. After Amazon RDS performs the upgrade, it takes an automatic backup of the instance. You can perform a point-in-time restore to times before the upgrade began and after the automatic backup of your instance has completed.

**10If an upgrade fails with precheck procedure errors, resolve the issues** – During the major version upgrade process, Amazon RDS for PostgreSQL first runs a precheck procedure to identify any issues that might cause the upgrade to fail. The precheck procedure checks all potential incompatible conditions across all databases in the instance.

If the precheck encounters an issue, it creates a log event indicating the upgrade precheck failed. The precheck process details are in an upgrade log named `pg_upgrade_precheck.log` for all the databases of a DB instance. Amazon RDS appends a timestamp to the file name. For more information about viewing logs, see [Working with Amazon RDS database log files \(p. 524\)](#).

If a replica upgrade fails at precheck, replication on the failed replica is broken and the replica is put in the terminated state. Delete the replica and recreate a new replica based on the upgraded primary instance.

Resolve all of the issues identified in the precheck log and then retry the major version upgrade. The following is an example of a precheck log.

```

Upgrade could not be run on Wed Apr 4 18:30:52 2018

The instance could not be upgraded from 9.6.11 to 10.6 for the following reasons.
Please take appropriate action on databases that have usage incompatible with the
requested major engine version upgrade and try the upgrade again.

* There are uncommitted prepared transactions. Please commit or rollback all prepared
transactions.* One or more role names start with 'pg_'. Rename all role names that start
with 'pg_'.

* The following issues in the database 'my"million$db' need to be corrected before
upgrading:** The ["line","reg*"] data types are used in user tables. Remove all usage of
these data types.
** The database name contains characters that are not supported by RDS for PostgreSQL.
Rename the database.
** The database has extensions installed that are not supported on the target database
version. Drop the following extensions from your database: ["tsearch2"].

* The following issues in the database 'mydb' need to be corrected before upgrading:**
The database has views or materialized views that depend on 'pg_stat_activity'. Drop the
views.
```

**11If a replica upgrade fails while upgrading the database, resolve the issue** – A failed replica is placed in the incompatible-restore state and replication is terminated on the DB instance. Delete the replica and recreate a new replica based on the upgraded primary instance.

A replica upgrade might fail for the following reasons:

- It was unable to catch up with the primary instance even after a wait time.
- It was in a terminal or incompatible lifecycle state such as storage-full, incompatible-restore, and so on.
- When the primary instance upgrade started, there was a separate minor version upgrade running on the replica.
- The replica instance used incompatible parameters.
- The replica instance was unable to communicate with the primary instance to synchronize the data folder.

**12Upgrade your production instance** – When the dry-run major version upgrade is successful, you should be able to upgrade your production database with confidence. For more information, see [Manually upgrading the engine version \(p. 272\)](#).

After the major version upgrade is complete, we recommend the following:

- Run the `ANALYZE` operation to refresh the `pg_statistic` table.
- A PostgreSQL upgrade doesn't upgrade any PostgreSQL extensions. To upgrade extensions, see [Upgrading PostgreSQL extensions \(p. 1578\)](#).
- Optionally, use Amazon RDS to view two logs that the `pg_upgrade` utility produces. These are `pg_upgrade_internal.log` and `pg_upgrade_server.log`. Amazon RDS appends a timestamp to the file name for these logs. You can view these logs as you can any other log. For more information, see [Working with Amazon RDS database log files \(p. 524\)](#).

You can also upload the upgrade logs to Amazon CloudWatch Logs. For more information, see [Publishing PostgreSQL logs to Amazon CloudWatch Logs \(p. 560\)](#).

- To verify that everything works as expected, test your application on the upgraded database with a similar workload. After the upgrade is verified, you can delete this test instance.

## Automatic minor version upgrades for PostgreSQL

If you enable the **Auto minor version upgrade** option when creating or modifying a DB instance, you can have your DB instance automatically upgraded.

For each RDS for PostgreSQL major version, one minor version is designated by RDS as the automatic upgrade version. After a minor version has been tested and approved by Amazon RDS, the minor version upgrade occurs automatically during your maintenance window. RDS doesn't automatically set newer released minor versions as the automatic upgrade version. Before RDS designates a newer automatic upgrade version, several criteria are considered, such as the following:

- Known security issues
- Bugs in the PostgreSQL community version
- Overall fleet stability since the minor version was released

You can use the following AWS CLI command and script to determine the current automatic upgrade minor versions.

```
aws rds describe-db-engine-versions --engine postgres | grep -A 1 AutoUpgrade| grep -A 2 true |grep PostgreSQL | sort --unique | sed -e 's/"Description": "//g'
```

### Note

If no results are returned, there is no automatic minor version upgrade available and scheduled.

A PostgreSQL DB instance is automatically upgraded during your maintenance window if the following criteria are met:

- The DB instance has the **Auto minor version upgrade** option enabled.
- The DB instance is running a minor DB engine version that is less than the current automatic upgrade minor version.

For more information, see [Automatically upgrading the minor engine version \(p. 274\)](#).

### Note

A PostgreSQL upgrade doesn't upgrade PostgreSQL extensions. To upgrade extensions, see [Upgrading PostgreSQL extensions \(p. 1578\)](#).

## Upgrading PostgreSQL extensions

A PostgreSQL engine upgrade doesn't upgrade most PostgreSQL extensions. To update an extension after a version upgrade, use the `ALTER EXTENSION UPDATE` command.

**Note**

If you are running the PostGIS extension in your Amazon RDS PostgreSQL DB instance, make sure that you follow the [PostGIS upgrade instructions](#) in the PostGIS documentation before you update the extension.

To upgrade an extension, use the following command.

```
ALTER EXTENSION extension_name UPDATE TO 'new_version'
```

For the list of supported versions of PostgreSQL extensions, see [PostgreSQL extensions supported on Amazon RDS \(p. 1520\)](#).

To list your currently installed extensions, use the PostgreSQL [pg\\_extension](#) catalog in the following command.

```
SELECT * FROM pg_extension;
```

To view a list of the specific extension versions that are available for your installation, use the PostgreSQL [pg\\_available\\_extension\\_versions](#) view in the following command.

```
SELECT * FROM pg_available_extension_versions;
```

# Upgrading a PostgreSQL DB snapshot engine version

With Amazon RDS, you can create a storage volume DB snapshot of your PostgreSQL DB instance. When you create a DB snapshot, the snapshot is based on the engine version used by your Amazon RDS instance. In addition to upgrading the DB engine version of your DB instance, you can also upgrade the engine version for your DB snapshots.

After restoring a DB snapshot upgraded to a new engine version, make sure to test that the upgrade was successful. For more information about a major version upgrade, see [Upgrading the PostgreSQL DB engine for Amazon RDS \(p. 1571\)](#). To learn how to restore a DB snapshot, see [Restoring from a DB snapshot \(p. 352\)](#).

You can upgrade manual DB snapshots that are either encrypted or not encrypted.

For the list of engine versions that are available for upgrading a DB snapshot, see [Upgrading the PostgreSQL DB engine for Amazon RDS](#).

**Note**

You can't upgrade automated DB snapshots that are created during the automated backup process.

## Console

### To upgrade a DB snapshot

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Snapshots**.
3. Choose the snapshot that you want to upgrade.
4. For **Actions**, choose **Upgrade snapshot**. The **Upgrade snapshot** page appears.
5. Choose the **New engine version** to upgrade to.
6. Choose **Save changes** to upgrade the snapshot.

During the upgrade process, all snapshot actions are disabled for this DB snapshot. Also, the DB snapshot status changes from **available** to **upgrading**, and then changes to **active** upon completion. If the DB snapshot can't be upgraded because of snapshot corruption issues, the status changes to **unavailable**. You can't recover the snapshot from this state.

**Note**

If the DB snapshot upgrade fails, the snapshot is rolled back to the original state with the original version.

## AWS CLI

To upgrade a DB snapshot to a new database engine version, use the AWS CLI [modify-db-snapshot](#) command.

### Parameters

- **--db-snapshot-identifier** – The identifier of the DB snapshot to upgrade. The identifier must be a unique Amazon Resource Name (ARN). For more information, see [Working with Amazon Resource Names \(ARNs\) in Amazon RDS \(p. 311\)](#).
- **--engine-version** – The engine version to upgrade the DB snapshot to.

## Example

For Linux, macOS, or Unix:

```
aws rds modify-db-snapshot \
--db-snapshot-identifier my_db_snapshot \
--engine-version new_version
```

For Windows:

```
aws rds modify-db-snapshot ^
--db-snapshot-identifier my_db_snapshot ^
--engine-version new_version
```

## RDS API

To upgrade a DB snapshot to a new database engine version, call the Amazon RDS API [ModifyDBSnapshot](#) operation.

- **DBSnapshotIdentifier** – The identifier of the DB snapshot to upgrade. The identifier must be a unique Amazon Resource Name (ARN). For more information, see [Working with Amazon Resource Names \(ARNs\) in Amazon RDS \(p. 311\)](#).
- **EngineVersion** – The engine version to upgrade the DB snapshot to.

# Working with PostgreSQL read replicas in Amazon RDS

You usually use read replicas to configure replication between Amazon RDS DB instances. For general information about read replicas, see [Working with read replicas \(p. 279\)](#).

This section contains specific information about working with read replicas on PostgreSQL.

## Topics

- [Read replica configuration with PostgreSQL \(p. 1582\)](#)
- [Monitoring PostgreSQL read replicas \(p. 1583\)](#)
- [Read replica limitations with PostgreSQL \(p. 1583\)](#)
- [Replication interruptions with PostgreSQL read replicas \(p. 1583\)](#)
- [Troubleshooting a PostgreSQL read replica problem \(p. 1584\)](#)

## Read replica configuration with PostgreSQL

Amazon RDS PostgreSQL uses PostgreSQL native streaming replication to create a read-only copy of a source DB instance. This read replica (a "standby" in PostgreSQL terms) DB instance is an asynchronously created physical replication of the source DB instance. It's created by a special connection that transmits write ahead log (WAL) data between the source DB instance and the read replica where PostgreSQL asynchronously streams database changes as they are made.

PostgreSQL uses a "replication" role to perform streaming replication. The role is privileged, but can't be used to modify any data. PostgreSQL uses a single process for handling replication.

Before a DB instance can serve as a source DB instance, you must enable automatic backups on the source DB instance by setting the backup retention period to a value other than 0.

Creating a PostgreSQL read replica doesn't require an outage for the source DB instance. Amazon RDS sets the necessary parameters and permissions for the source DB instance and the read replica without any service interruption. A snapshot is taken of the source DB instance, and this snapshot becomes the read replica. No outage occurs when you delete a read replica.

You can create up to five read replicas from one source DB instance. For replication to operate effectively, each read replica should have the same amount of compute and storage resources as the source DB instance. If you scale the source DB instance, also scale the read replicas.

Amazon RDS overrides any incompatible parameters on a read replica if it prevents the read replica from starting. For example, suppose that the `max_connections` parameter value is higher on the source DB instance than on the read replica. In that case, Amazon RDS updates the parameter on the read replica to be the same value as that on the source DB instance.

PostgreSQL DB instances use a secure connection that you can encrypt by setting the `ssl` parameter to 1 for both the source and the read replica instances.

You can create a read replica from either single-AZ or Multi-AZ DB instance deployments. You use Multi-AZ deployments to improve the durability and availability of critical data, but you can't use the Multi-AZ secondary to serve read-only queries. Instead, you can create read replicas from high-traffic Multi-AZ DB instances to offload read-only queries. If the source instance of a Multi-AZ deployment fails over to the secondary, any associated read replicas automatically switch to use the secondary (now primary) as their replication source. For more information, see [High availability \(Multi-AZ\) for Amazon RDS \(p. 52\)](#).

You can create a read replica as a Multi-AZ DB instance. Amazon RDS creates a standby of your replica in another Availability Zone for failover support for the replica. Creating your read replica as a Multi-AZ DB instance is independent of whether the source database is a Multi-AZ DB instance.

If you use the [postgres\\_fdw](#) extension to access data from a remote server, the read replica will also have access to the remote server. For more information about using `postgres_fdw`, see [Accessing external data with the postgres\\_fdw extension \(p. 1630\)](#).

## Monitoring PostgreSQL read replicas

For PostgreSQL read replicas, you can monitor replication lag in Amazon CloudWatch by viewing the Amazon RDS `ReplicaLag` metric. The `ReplicaLag` metric reports the value of `SELECT extract(epoch from now() - pg_last_xact_replay_timestamp()) AS replica_lag`.

## Read replica limitations with PostgreSQL

The following are limitations for PostgreSQL read replicas:

- Each PostgreSQL read replicas is read-only. You can't make a writable read replica.
- You can't create a read replica from another read replica. Thus, you can't create cascading read replicas.
- You can promote a PostgreSQL read replica to be a new source DB instance. However, the read replica doesn't become the new source DB instance automatically. The read replica, when promoted, stops receiving WAL communications and is no longer a read-only instance. You must set up any replication you intend to have going forward because the promoted read replica is now a new source DB instance.
- If no user transactions are occurring on the source DB instance, a PostgreSQL read replica reports a replication lag of up to five minutes.
- You can't create physical replication slots in PostgreSQL.
- You can't enable automated backups on PostgreSQL read replicas.

## Replication interruptions with PostgreSQL read replicas

In several situations, a PostgreSQL source DB instance can unintentionally break replication with a read replica. These situations include the following:

- The `max_wal_senders` parameter is set too low to provide enough data to the number of read replicas. This situation causes replication to stop.
- The PostgreSQL parameter `wal_keep_segments` dictates how many WAL files are kept to provide data to the read replicas. The parameter value specifies the number of logs to keep. If you set the parameter value too low, you can cause a read replica to fall so far behind that streaming replication stops. In this case, Amazon RDS reports a replication error and begins recovery on the read replica by replaying the source DB instance's archived WAL logs. This recovery process continues until the read replica has caught up enough to continue streaming replication. For more information, see [Troubleshooting a PostgreSQL read replica problem \(p. 1584\)](#).
- Starting with PostgreSQL 13, a database restart isn't required for read replicas if the source DB instance IP address changes. For PostgreSQL versions older than 13, changes to the source DB instance IP address require a read replica reboot. IP address changes include a DB instance name change or a DB instance class change.

When the WAL stream that provides data to a read replica is broken, PostgreSQL switches into recovery mode to restore the read replica by using archived WAL files. When this process is complete, PostgreSQL attempts to re-establish streaming replication.

## Troubleshooting a PostgreSQL read replica problem

PostgreSQL uses replication slots for cross-Region replication, so the process for troubleshooting same-region replication problems and cross-Region replication problems is different.

### Troubleshooting PostgreSQL read replica problems within an AWS Region

The PostgreSQL parameter, `wal_keep_segments`, dictates how many write ahead log (WAL) files are kept to provide data to the read replicas. The parameter value specifies the number of logs to keep. If you set the parameter value too low, you can cause a read replica to fall so far behind that streaming replication stops. In this case, Amazon RDS reports a replication error and begins recovery on the read replica by replaying the source DB instance's archived WAL logs. This recovery process continues until the read replica has caught up enough to continue streaming replication.

The PostgreSQL log on the read replica shows when Amazon RDS is recovering a read replica that is this state by replaying archived WAL files.

```
2014-11-07 19:01:10 UTC::@[23180]:DEBUG: switched WAL source from archive to stream
after
failure 2014-11-07 19:01:10 UTC::@[11575]:LOG: started streaming WAL from primary
at
1A/D3000000 on timeline 1 2014-11-07 19:01:10 UTC::@[11575]:FATAL: could not
receive
data from WAL stream: ERROR: requested WAL segment 000000010000001A000000D3 has
already been
removed 2014-11-07 19:01:10 UTC::@[23180]:DEBUG: could not restore file
"00000002.history" from archive: return code 0 2014-11-07 19:01:15
UTC::@[23180]:DEBUG: switched WAL source from stream to archive after failure
recovering 000000010000001A000000D3 2014-11-07 19:01:16 UTC::@[23180]:LOG: restored
log file "000000010000001A000000D3"
from archive
```

After a certain amount of time, Amazon RDS replays enough archived WAL files on the replica to catch up and allow the read replica to begin streaming again. At this point, PostgreSQL resumes streaming and writes a similar line to the following to the log file.

```
2014-11-07 19:41:36 UTC::@[24714]:LOG: started streaming WAL from primary at 1B/
B6000000
on timeline 1
```

You can determine how many WAL files you should keep by looking at the checkpoint information in the log. The PostgreSQL log shows the following information at each checkpoint. By looking at the "# recycled" transaction log files of these log statements, you can understand how many transaction files will be recycled during a time range and use this information to tune the `wal_keep_segments` parameter.

```
2014-11-07 19:59:35 UTC::@[26820]:LOG: checkpoint complete: wrote 376 buffers (0.2%); 0
transaction log file(s) added, 0 removed, 1 recycled; write=35.681 s, sync=0.013 s,
total=35.703 s; sync files=10, longest=0.013 s, average=0.001 s
```

For example, suppose that the PostgreSQL log shows that 35 files are recycled from the "checkpoint completed" log statements within a 5-minute time frame. In that case, we know that with this usage pattern a read replica relies on 35 transaction files in five minutes. A read replica can't survive five minutes in a nonstreaming state if the source DB instance is set to the default `wal_keep_segments` parameter value of 32.

# Troubleshooting PostgreSQL read replica problems across AWS Regions

PostgreSQL version 9.5.2 uses physical replication slots to manage write ahead log (WAL) retention on the source DB instance. For each cross-Region read replica instance, Amazon RDS creates and associates a physical replication slot. You can use two Amazon CloudWatch metrics, Oldest Replication Slot Lag and Transaction Logs Disk Usage, to see how far behind the most lagging replica is in terms of WAL data received and to see how much storage is being used for WAL data. The Transaction Logs Disk Usage value can substantially increase when a cross-Region read replica is lagging significantly.

If the workload on your DB instance generates a large amount of WAL data, you might need to change the DB instance class of your source DB instance and read replica. In that case, you change it to one with high (10 Gbps) network performance for the replica to keep up. The Amazon CloudWatch metric `Transaction Logs Generation` can help you understand the rate at which your workload is generating WAL data.

To determine the status of a cross-Region read replica, you can query `pg_replication_slots` on the source instance, as in the following example:

# Importing data into PostgreSQL on Amazon RDS

Suppose that you have an existing PostgreSQL deployment that you want to move to Amazon RDS. The complexity of your task depends on the size of your database and the types of database objects that you're transferring. For example, consider a database that contains datasets on the order of gigabytes, along with stored procedures and triggers. Such a database is going to be more complicated than a simple database with only a few megabytes of test data and no triggers or stored procedures.

We recommend that you use native PostgreSQL database migration tools under the following conditions:

- You have a homogeneous migration, where you are migrating from a database with the same database engine as the target database.
- You are migrating an entire database.
- The native tools allow you to migrate your system with minimal downtime.

In most other cases, performing a database migration using AWS Database Migration Service (AWS DMS) is the best approach. AWS DMS can migrate databases without downtime and, for many database engines, continue ongoing replication until you are ready to switch over to the target database. You can migrate to either the same database engine or a different database engine using AWS DMS. If you are migrating to a different database engine than your source database, you can use the AWS Schema Conversion Tool (AWS SCT). You use AWS SCT to migrate schema objects that are not migrated by AWS DMS. For more information about AWS DMS, see [What is AWS Database Migration Service?](#)

Modify your DB parameter group to include the following settings *for your import only*. You should test the parameter settings to find the most efficient settings for your DB instance size. You also need to revert back to production values for these parameters after your import completes.

Modify your DB instance settings to the following:

- Disable DB instance backups (set `backup_retention` to 0).
- Disable Multi-AZ.

Modify your DB parameter group to include the following settings. You should only use these settings when importing data. You should test the parameter settings to find the most efficient settings for your DB instance size. You also need to revert back to production values for these parameters after your import completes.

Parameter	Recommended value when importing	Description
<code>maintenance_work_mem</code>	524288, 1048576, 2097152, or 4194304 (in KB). These settings are comparable to 512 MB, 1 GB, 2 GB, and 4 GB.	The value for this setting depends on the size of your host. This parameter is used during <code>CREATE INDEX</code> statements and each parallel command can use this much memory. Calculate the best value so that you don't set this value so high that you run out of memory.
<code>checkpoint_segments</code>	256	The value for this setting consumes more disk space, but gives you less contention on a write ahead log (WAL). This setting is only supported for PostgreSQL versions 9.5 and earlier. For versions 9.6 and later, use <code>max_wal_size</code> .

Parameter	Recommended value when importing	Description
max_wal_size	256 (for version 9.6), 4096 (for versions 10 and later)	Maximum size to let the WAL grow during automatic checkpoints. Increasing this parameter can increase the amount of time needed for crash recovery. This parameter replaces <code>checkpoint_segments</code> for PostgreSQL 9.6 and later.  For PostgreSQL version 9.6, this value is in 16 MB units. For later versions, the value is in 1 MB units. For example, in version 9.6, 128 means 128 chunks that are each 16 MB in size. In version 12.4, 2048 means 2048 chunks that are each 1 MB in size.
checkpoint_timeout	1800	The value for this setting allows for less frequent WAL rotation.
synchronous_commit	Off	Disable this setting to speed up writes. Turning this parameter off can increase the risk of data loss in the event of a server crash (do not turn off FSYNC).
wal_buffers	8192	This value is in 8 KB units. This again helps your WAL generation speed
autovacuum	Off	Disable the PostgreSQL auto vacuum parameter while you are loading data so that it doesn't use resources

Use the `pg_dump -Fc` (compressed) or `pg_restore -j` (parallel) commands with these settings.

**Note**

The PostgreSQL command `pg_dumpall` requires `super_user` permissions that are not granted when you create a DB instance, so it cannot be used for importing data.

**Topics**

- [Importing a PostgreSQL database from an Amazon EC2 instance \(p. 1587\)](#)
- [Using the `\copy` command to import data to a table on a PostgreSQL DB instance \(p. 1589\)](#)
- [Importing Amazon S3 data into an RDS for PostgreSQL DB instance \(p. 1590\)](#)
- [Transporting PostgreSQL databases between DB instances \(p. 1601\)](#)

## Importing a PostgreSQL database from an Amazon EC2 instance

If you have data in a PostgreSQL server on an Amazon EC2 instance and want to move it to a PostgreSQL DB instance, you can use the following process. The following list shows the steps to take. Each step is discussed in more detail in the following sections.

1. Create a file using `pg_dump` that contains the data to be loaded
2. Create the target DB instance
3. Use `psql` to create the database on the DB instance and load the data

4. Create a DB snapshot of the DB instance

## Step 1: Create a file using pg\_dump that contains the data to load

The `pg_dump` utility uses the `COPY` command to create a schema and data dump of a PostgreSQL database. The dump script generated by `pg_dump` loads data into a database with the same name and recreates the tables, indexes, and foreign keys. You can use the `pg_restore` command and the `-d` parameter to restore the data to a database with a different name.

Before you create the data dump, you should query the tables to be dumped to get a row count so you can confirm the count on the target DB instance.

The following command creates a dump file called `mydb2dump.sql` for a database called `mydb2`.

```
prompt>pg_dump dbname=mydb2 -f mydb2dump.sql
```

## Step 2: Create the target DB instance

Create the target PostgreSQL DB instance using either the Amazon RDS console, AWS CLI, or API. Create the instance with the backup retention setting set to 0 and disable Multi-AZ. Doing so allows faster data import. You must create a database on the instance before you can dump the data. The database can have the same name as the database that is contained the dumped data. Alternatively, you can create a database with a different name. In this case, you use the `pg_restore` command and the `-d` parameter to restore the data into the newly named database.

For example, the following commands can be used to dump, restore, and rename a database.

```
pg_dump -Fc -v -h [endpoint of instance] -U [master username] [database] > [database].dump
createdb [new database name]
pg_restore -v -h [endpoint of instance] -U [master username] -d [new database name] [database].dump
```

## Step 3: Use psql to create the database on the DB instance and load data

You can use the same connection you used to run the `pg_dump` command to connect to the target DB instance and recreate the database. Using `psql`, you can use the master user name and master password to create the database on the DB instance.

The following example uses `psql` and a dump file named `mydb2dump.sql` to create a database called `mydb2` on a PostgreSQL DB instance called `mypginstance`:

For Linux, macOS, or Unix:

```
psql \
-f mydb2dump.sql \
--host mypginstance.c6c8mntzhgv0.us-west-2.rds.amazonaws.com \
--port 8199 \
--username myawsuser \
--password password \
--dbname mydb2
```

For Windows:

```
psql ^
-f mydb2dump.sql ^
--host mypginstance.c6c8mntzhgv0.us-west-2.rds.amazonaws.com ^
--port 8199 ^
--username myawsuser ^
--password password ^
--dbname mydb
```

## Step 4: Create a DB snapshot of the DB instance

Once you have verified that the data was loaded into your DB instance, we recommend that you create a DB snapshot of the target PostgreSQL DB instance. DB snapshots are complete backups of your DB instance that can be used to restore your DB instance to a known state. A DB snapshot taken immediately after the load protects you from having to load the data again in case of a mishap. You can also use such a snapshot to seed new DB instances. For information about creating a DB snapshot, see [Creating a DB snapshot \(p. 349\)](#).

## Using the `\copy` command to import data to a table on a PostgreSQL DB instance

You can run the `\copy` command from the `psql` prompt to import data into a table on a PostgreSQL DB instance. The table must already exist on the DB instance. For more information on the `\copy` command, see the [PostgreSQL documentation](#).

### Note

The `\copy` command doesn't provide confirmation of actions, such as a count of rows inserted. PostgreSQL does provide error messages if the copy command fails due to an error.

Create a .csv file from the data in the source table, log on to the target database on the PostgreSQL instance using `psql`, and then run the following command. This example uses *source-table* as the source table name, *source-table.csv* as the .csv file, and *target-db* as the target database:

```
target-db=> \copy source-table from 'source-table.csv' with DELIMITER ',';
```

You can also run the following command from your client computer command prompt. This example uses *source-table* as the source table name, *source-table.csv* as the .csv file, and *target-db* as the target database:

For Linux, macOS, or Unix:

```
$psql target-db \
-U <admin user> \
-p <port> \
-h <DB instance name> \
-c "\copy source-table from 'source-table.csv' with DELIMITER ','"
```

For Windows:

```
$psql target-db ^
-U <admin user> ^
-p <port> ^
-h <DB instance name> ^
```

```
-c "\copy source-table from 'source-table.csv' with DELIMITER ',' "
```

## Importing Amazon S3 data into an RDS for PostgreSQL DB instance

You can import data from Amazon S3 into a table belonging to an RDS for PostgreSQL DB instance. To do this, you use the `aws_s3` PostgreSQL extension that Amazon RDS provides.

### Note

To import from Amazon S3 into RDS for PostgreSQL, your database must be running PostgreSQL version 10.7 or later.

For more information on storing data with Amazon S3, see [Create a bucket](#) in the *Amazon Simple Storage Service Getting Started Guide*. For instructions on how to upload a file to an Amazon S3 bucket, see [Add an object to a bucket](#) in the *Amazon Simple Storage Service Getting Started Guide*.

### Topics

- [Overview of importing Amazon S3 data \(p. 1590\)](#)
- [Setting up access to an Amazon S3 bucket \(p. 1591\)](#)
- [Using the `aws\_s3.table\_import\_from\_s3` function to import Amazon S3 data \(p. 1596\)](#)
- [Function reference \(p. 1598\)](#)

## Overview of importing Amazon S3 data

To import data stored in an Amazon S3 bucket to a PostgreSQL database table, follow these steps.

### To import S3 data into Amazon RDS

1. Install the required PostgreSQL extensions. These include the `aws_s3` and `aws_commons` extensions. To do so, start `psql` and use the following command.

```
psql=> CREATE EXTENSION aws_s3 CASCADE;
NOTICE: installing required extension "aws_commons"
```

The `aws_s3` extension provides the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function that you use to import Amazon S3 data. The `aws_commons` extension provides additional helper functions.

2. Identify the database table and Amazon S3 file to use.

The [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function requires the name of the PostgreSQL database table that you want to import data into. The function also requires that you identify the Amazon S3 file to import. To provide this information, take the following steps.

- a. Identify the PostgreSQL database table to put the data in. For example, the following is a sample `t1` database table used in the examples for this topic.

```
psql=> CREATE TABLE t1 (col1 varchar(80), col2 varchar(80), col3 varchar(80));
```

- b. Get the following information to identify the Amazon S3 file that you want to import:

- Bucket name – A *bucket* is a container for Amazon S3 objects or files.
- File path – The file path locates the file in the Amazon S3 bucket.
- AWS Region – The AWS Region is the location of the Amazon S3 bucket. For example, if the S3 bucket is in the US East (N. Virginia) Region, use `us-east-1`. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

To find how to get this information, see [View an object](#) in the *Amazon Simple Storage Service Getting Started Guide*. You can confirm the information by using the AWS CLI command `aws s3 cp`. If the information is correct, this command downloads a copy of the Amazon S3 file.

```
aws s3 cp s3://sample_s3_bucket/sample_file_path ./
```

- c. Use the [aws\\_commons.create\\_s3\\_uri \(p. 1600\)](#) function to create an `aws_commons._s3_uri_1` structure to hold the Amazon S3 file information. You provide this `aws_commons._s3_uri_1` structure as a parameter in the call to the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function.

For a psql example, see the following.

```
psql=> SELECT aws_commons.create_s3_uri(
 'sample_s3_bucket',
 'sample.csv',
 'us-east-1'
) AS s3_uri \gset
```

3. Provide permission to access the Amazon S3 file.

To import data from an Amazon S3 file, give the RDS for PostgreSQL DB instance permission to access the Amazon S3 bucket the file is in. To do this, you use either an AWS Identity and Access Management (IAM) role or security credentials. For more information, see [Setting up access to an Amazon S3 bucket \(p. 1591\)](#).

4. Import the Amazon S3 data by calling the `aws_s3.table_import_from_s3` function.

After you complete the previous preparation tasks, use the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function to import the Amazon S3 data. For more information, see [Using the aws\\_s3.table\\_import\\_from\\_s3 function to import Amazon S3 data \(p. 1596\)](#).

## Setting up access to an Amazon S3 bucket

To import data from an Amazon S3 file, give the RDS for PostgreSQL DB instance permission to access the Amazon S3 bucket the file is in. You provide access to an Amazon S3 bucket in one of two ways, as described in the following topics.

### Topics

- [Using an IAM role to access an Amazon S3 bucket \(p. 1591\)](#)
- [Using security credentials to access an Amazon S3 bucket \(p. 1595\)](#)
- [Troubleshooting access to Amazon S3 \(p. 1595\)](#)

## Using an IAM role to access an Amazon S3 bucket

Before you load data from an Amazon S3 file, give your RDS for PostgreSQL DB instance permission to access the Amazon S3 bucket the file is in. This way, you don't have to manage additional credential information or provide it in the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function call.

To do this, create an IAM policy that provides access to the Amazon S3 bucket. Create an IAM role and attach the policy to the role. Then assign the IAM role to your DB instance.

### To give an RDS for PostgreSQL DB instance access to Amazon S3 through an IAM role

1. Create an IAM policy.

This policy provides the bucket and object permissions that allow your RDS for PostgreSQL DB instance to access Amazon S3.

Include in the policy the following required actions to allow the transfer of files from an Amazon S3 bucket to Amazon RDS:

- s3:GetObject
- s3>ListBucket

Include in the policy the following resources to identify the Amazon S3 bucket and objects in the bucket. This shows the Amazon Resource Name (ARN) format for accessing Amazon S3.

- arn:aws:s3:::*your-s3-bucket*
- arn:aws:s3:::*your-s3-bucket*/\*

For more information on creating an IAM policy for Amazon RDS for PostgreSQL, see [Creating and using an IAM policy for IAM database access \(p. 1702\)](#). See also [Tutorial: Create and attach your first customer managed policy](#) in the *IAM User Guide*.

The following AWS CLI command creates an IAM policy named `rds-s3-import-policy` with these options. It grants access to a bucket named `your-s3-bucket`.

**Note**

After you create the policy, note the Amazon Resource Name (ARN) of the policy. You need the ARN for a subsequent step when you attach the policy to an IAM role.

**Example**

For Linux, macOS, or Unix:

```
aws iam create-policy \
--policy-name rds-s3-import-policy \
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "s3import",
 "Action": [
 "s3:GetObject",
 "s3>ListBucket"
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket",
 "arn:aws:s3:::your-s3-bucket/*"
]
 }
]
}'
```

For Windows:

```
aws iam create-policy ^
--policy-name rds-s3-import-policy ^
--policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
```

```
 "Sid": "s3import",
 "Action": [
 "s3:GetObject",
 "s3>ListBucket"
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket",
 "arn:aws:s3:::your-s3-bucket/*"
]
}
}'
```

2. Create an IAM role.

You do this so Amazon RDS can assume this IAM role on your behalf to access your Amazon S3 buckets. For more information, see [Creating a role to delegate permissions to an IAM user](#) in the *IAM User Guide*.

The following example shows using the AWS CLI command to create a role named `rds-s3-import-role`.

### Example

For Linux, macOS, or Unix:

```
aws iam create-role \
--role-name rds-s3-import-role \
--assume-role-policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]
}'
```

For Windows:

```
aws iam create-role ^
--role-name rds-s3-import-role ^
--assume-role-policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]
}'
```

3. Attach the IAM policy that you created to the IAM role that you created.

The following AWS CLI command attaches the policy created earlier to the role named `rds-s3-import-role`. Replace `your-policy-arn` with the policy ARN that you noted in an earlier step.

### Example

For Linux, macOS, or Unix:

```
aws iam attach-role-policy \
 --policy-arn your-policy-arn \
 --role-name rds-s3-import-role
```

For Windows:

```
aws iam attach-role-policy ^
 --policy-arn your-policy-arn ^
 --role-name rds-s3-import-role
```

4. Add the IAM role to the DB instance.

You do so by using the AWS Management Console or AWS CLI, as described following.

#### Note

Also, be sure the database you use doesn't have any restrictions noted in [Importing Amazon S3 data into an RDS for PostgreSQL DB instance \(p. 1590\)](#).

### Console

#### To add an IAM role for a PostgreSQL DB instance using the console

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. Choose the PostgreSQL DB instance name to display its details.
3. On the **Connectivity & security** tab, in the **Manage IAM roles** section, choose the role to add under **Add IAM roles to this instance**.
4. Under **Feature**, choose **s3Import**.
5. Choose **Add role**.

### AWS CLI

#### To add an IAM role for a PostgreSQL DB instance using the CLI

- Use the following command to add the role to the PostgreSQL DB instance named `my-db-instance`. Replace `your-role-arn` with the role ARN that you noted in a previous step. Use `s3Import` for the value of the `--feature-name` option.

### Example

For Linux, macOS, or Unix:

```
aws rds add-role-to-db-instance \
 --db-instance-identifier my-db-instance \
 --feature-name s3Import \
 --role-arn your-role-arn \
 --region your-region
```

For Windows:

```
aws rds add-role-to-db-instance ^
--db-instance-identifier my-db-instance ^
--feature-name s3Import ^
--role-arn your-role-arn ^
--region your-region
```

## RDS API

To add an IAM role for a PostgreSQL DB instance using the Amazon RDS API, call the [AddRoleToDBInstance](#) operation.

## Using security credentials to access an Amazon S3 bucket

If you prefer, you can use security credentials to provide access to an Amazon S3 bucket instead of providing access with an IAM role. To do this, use the `credentials` parameter in the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function call.

The `credentials` parameter is a structure of type `aws_commons._aws_credentials_1`, which contains AWS credentials. Use the [aws\\_commons.create\\_aws\\_credentials \(p. 1600\)](#) function to set the access key and secret key in an `aws_commons._aws_credentials_1` structure, as shown following.

```
psql=> SELECT aws_commons.create_aws_credentials(
 'sample_access_key', 'sample_secret_key', '')
AS creds \gset
```

After creating the `aws_commons._aws_credentials_1` structure, use the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function with the `credentials` parameter to import the data, as shown following.

```
psql=> SELECT aws_s3.table_import_from_s3(
 't', '', '(format csv)',
 :'s3_uri',
 :'creds'
);
```

Or you can include the [aws\\_commons.create\\_aws\\_credentials \(p. 1600\)](#) function call inline within the `aws_s3.table_import_from_s3` function call.

```
psql=> SELECT aws_s3.table_import_from_s3(
 't', '', '(format csv)',
 :'s3_uri',
 aws_commons.create_aws_credentials('sample_access_key', 'sample_secret_key', '')
);
```

## Troubleshooting access to Amazon S3

If you encounter connection problems when attempting to import Amazon S3 file data, see the following for recommendations:

- [Troubleshooting Amazon RDS identity and access \(p. 1727\)](#)
- [Troubleshooting Amazon S3](#)
- [Troubleshooting Amazon S3 and IAM](#)

## Using the `aws_s3.table_import_from_s3` function to import Amazon S3 data

Import your Amazon S3 data by calling the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function.

### Note

The following examples use the IAM role method for providing access to the Amazon S3 bucket. Thus, the `aws_s3.table_import_from_s3` function calls don't include credential parameters.

The following shows a typical PostgreSQL example using `psql`.

```
psql=> SELECT aws_s3.table_import_from_s3(
 't1',
 '',
 '(format csv)',
 :'s3_uri'
);
```

The parameters are the following:

- `t1` – The name for the table in the PostgreSQL DB instance to copy the data into.
- `''` – An optional list of columns in the database table. You can use this parameter to indicate which columns of the S3 data go in which table columns. If no columns are specified, all the columns are copied to the table. For an example of using a column list, see [Importing an Amazon S3 file that uses a custom delimiter \(p. 1596\)](#).
- `(format csv)` – PostgreSQL COPY arguments. The copy process uses the arguments and format of the [PostgreSQL COPY](#) command. In the preceding example, the COPY command uses the comma-separated value (CSV) file format to copy the data.
- `s3_uri` – A structure that contains the information identifying the Amazon S3 file. For an example of using the [aws\\_commons.create\\_s3\\_uri \(p. 1600\)](#) function to create an `s3_uri` structure, see [Overview of importing Amazon S3 data \(p. 1590\)](#).

The return value is text. For the full reference of this function, see [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#).

The following examples show how to specify different kinds of files when importing Amazon S3 data.

### Topics

- [Importing an Amazon S3 file that uses a custom delimiter \(p. 1596\)](#)
- [Importing an Amazon S3 compressed \(gzip\) file \(p. 1597\)](#)
- [Importing an encoded Amazon S3 file \(p. 1597\)](#)

## Importing an Amazon S3 file that uses a custom delimiter

The following example shows how to import a file that uses a custom delimiter. It also shows how to control where to put the data in the database table using the `column_list` parameter of the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function.

For this example, assume that the following information is organized into pipe-delimited columns in the Amazon S3 file.

```
1|foo1|bar1|elephant1
2|foo2|bar2|elephant2
3|foo3|bar3|elephant3
4|foo4|bar4|elephant4
```

...

### To import a file that uses a custom delimiter

1. Create a table in the database for the imported data.

```
psql=> CREATE TABLE test (a text, b text, c text, d text, e text);
CREATE TABLE
```

2. Use the following form of the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function to import data from the Amazon S3 file.

You can include the [aws\\_commons.create\\_s3\\_uri \(p. 1600\)](#) function call inline within the `aws_s3.table_import_from_s3` function call to specify the file.

```
psql=> SELECT aws_s3.table_import_from_s3(
 'test',
 'a,b,d,e',
 'DELIMITER ''|''',
 aws_commons.create_s3_uri('sampleBucket', 'pipeDelimitedSampleFile', 'us-east-2')
);
```

The data is now in the table in the following columns.

```
psql=> SELECT * FROM test;
a | b | c | d | e
---+---+---+---+---+
1 | foo1 | | bar1 | elephant1
2 | foo2 | | bar2 | elephant2
3 | foo3 | | bar3 | elephant3
4 | foo4 | | bar4 | elephant4
```

### Importing an Amazon S3 compressed (gzip) file

The following example shows how to import a file from Amazon S3 that is compressed with gzip.

Ensure that the file contains the following Amazon S3 metadata:

- Key: Content-Encoding
- Value: gzip

For more about adding these values to Amazon S3 metadata, see [How do I add metadata to an S3 object?](#) in the *Amazon Simple Storage Service Console User Guide*.

Import the gzip file into your RDS for PostgreSQL DB instance as shown following.

```
psql=> CREATE TABLE test_gzip(id int, a text, b text, c text, d text);
CREATE TABLE
psql=> SELECT aws_s3.table_import_from_s3(
 'test_gzip', '', '(format csv)',
 'myS3Bucket', 'test-data.gz', 'us-east-2'
);
```

### Importing an encoded Amazon S3 file

The following example shows how to import a file from Amazon S3 that has Windows-1252 encoding.

```
psql=> SELECT aws_s3.table_import_from_s3(
 'test_table', '', 'encoding ''WIN1252'''',
 aws_commons.create_s3_uri('sampleBucket', 'SampleFile', 'us-east-2')
);
```

## Function reference

### Functions

- [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#)
- [aws\\_commons.create\\_s3\\_uri \(p. 1600\)](#)
- [aws\\_commons.create\\_aws\\_credentials \(p. 1600\)](#)

### aws\_s3.table\_import\_from\_s3

Imports Amazon S3 data into an Amazon RDS table. The `aws_s3` extension provides the `aws_s3.table_import_from_s3` function. The return value is text.

#### Syntax

The required parameters are `table_name`, `column_list` and `options`. These identify the database table and specify how the data is copied into the table.

You can also use the following parameters:

- The `s3_info` parameter specifies the Amazon S3 file to import. When you use this parameter, access to Amazon S3 is provided by an IAM role for the PostgreSQL DB instance.

```
aws_s3.table_import_from_s3 (
 table_name text,
 column_list text,
 options text,
 s3_info aws_commons._s3_uri_1
)
```

- The `credentials` parameter specifies the credentials to access Amazon S3. When you use this parameter, you don't use an IAM role.

```
aws_s3.table_import_from_s3 (
 table_name text,
 column_list text,
 options text,
 s3_info aws_commons._s3_uri_1,
 credentials aws_commons._aws_credentials_1
)
```

#### Parameters

##### *table\_name*

A required text string containing the name of the PostgreSQL database table to import the data into.

##### *column\_list*

A required text string containing an optional list of the PostgreSQL database table columns in which to copy the data. If the string is empty, all columns of the table are used. For an example, see [Importing an Amazon S3 file that uses a custom delimiter \(p. 1596\)](#).

*options*

A required text string containing arguments for the PostgreSQL `COPY` command. These arguments specify how the data is to be copied into the PostgreSQL table. For more details, see the [PostgreSQL COPY documentation](#).

*s3\_info*

An `aws_commons._s3_uri_1` composite type containing the following information about the S3 object:

- `bucket` – The name of the Amazon S3 bucket containing the file.
- `file_path` – The Amazon S3 file name including the path of the file.
- `region` – The AWS Region that the file is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

*credentials*

An `aws_commons._aws_credentials_1` composite type containing the following credentials to use for the import operation:

- Access key
- Secret key
- Session token

For information about creating an `aws_commons._aws_credentials_1` composite structure, see [aws\\_commons.create\\_aws\\_credentials \(p. 1600\)](#).

## Alternate syntax

To help with testing, you can use an expanded set of parameters instead of the `s3_info` and `credentials` parameters. Following are additional syntax variations for the `aws_s3.table_import_from_s3` function:

- Instead of using the `s3_info` parameter to identify an Amazon S3 file, use the combination of the `bucket`, `file_path`, and `region` parameters. With this form of the function, access to Amazon S3 is provided by an IAM role on the PostgreSQL DB instance.

```
aws_s3.table_import_from_s3 (
 table_name text,
 column_list text,
 options text,
 bucket text,
 file_path text,
 region text
)
```

- Instead of using the `credentials` parameter to specify Amazon S3 access, use the combination of the `access_key`, `session_key`, and `session_token` parameters.

```
aws_s3.table_import_from_s3 (
 table_name text,
 column_list text,
 options text,
 bucket text,
 file_path text,
 region text,
 access_key text,
 secret_key text,
 session_token text
)
```

## Alternate parameters

### *bucket*

A text string containing the name of the Amazon S3 bucket that contains the file.

### *file\_path*

A text string containing the Amazon S3 file name including the path of the file.

### *region*

A text string containing the AWS Region that the file is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

### *access\_key*

A text string containing the access key to use for the import operation. The default is NULL.

### *secret\_key*

A text string containing the secret key to use for the import operation. The default is NULL.

### *session\_token*

(Optional) A text string containing the session key to use for the import operation. The default is NULL.

## [aws\\_commons.create\\_s3\\_uri](#)

Creates an `aws_commons._s3_uri_1` structure to hold Amazon S3 file information. Use the results of the `aws_commons.create_s3_uri` function in the `s3_info` parameter of the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function.

### Syntax

```
aws_commons.create_s3_uri(
 bucket text,
 file_path text,
 region text
)
```

## Parameters

### *bucket*

A required text string containing the Amazon S3 bucket name for the file.

### *file\_path*

A required text string containing the Amazon S3 file name including the path of the file.

### *region*

A required text string containing the AWS Region that the file is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

## [aws\\_commons.create\\_aws\\_credentials](#)

Sets an access key and secret key in an `aws_commons._aws_credentials_1` structure. Use the results of the `aws_commons.create_aws_credentials` function in the `credentials` parameter of the [aws\\_s3.table\\_import\\_from\\_s3 \(p. 1598\)](#) function.

## Syntax

```
aws_commons.create_aws_credentials(
 access_key text,
 secret_key text,
 session_token text
)
```

## Parameters

### *access\_key*

A required text string containing the access key to use for importing an Amazon S3 file. The default is NULL.

### *secret\_key*

A required text string containing the secret key to use for importing an Amazon S3 file. The default is NULL.

### *session\_token*

An optional text string containing the session token to use for importing an Amazon S3 file. The default is NULL. If you provide an optional *session\_token*, you can use temporary credentials.

# Transporting PostgreSQL databases between DB instances

By using PostgreSQL Transportable Databases for Amazon RDS, you can transport a PostgreSQL database between two DB instances. This provides an extremely fast method of migrating large databases between separate DB instances. To transport databases using this method, your DB instances must both run the same major version of PostgreSQL.

To use transportable databases, install the `pg_transport` extension. This extension provides a physical transport mechanism to move each database. By streaming the database files with minimal processing, physical transport moves data much faster than traditional dump and load processes and takes minimal downtime. PostgreSQL transportable databases use a pull model where the destination DB instance imports the database from the source DB instance.

### Note

PostgreSQL transportable databases are available in RDS for PostgreSQL versions 10.10 and later, and 11.5 and later.

## Topics

- [Limitations for using PostgreSQL transportable databases \(p. 1601\)](#)
- [Setting up to transport PostgreSQL databases \(p. 1602\)](#)
- [Transporting a PostgreSQL database using the `transport.import\_from\_server` function \(p. 1603\)](#)
- [What happens during database transport \(p. 1603\)](#)
- [`transport.import\_from\_server` function reference \(p. 1604\)](#)
- [Configuration parameters for the `pg\_transport` extension \(p. 1604\)](#)

## Limitations for using PostgreSQL transportable databases

Transportable databases have the following limitations:

- **Read replicas** – You can't use transportable databases on read replicas or parent instances of read replicas.
- **Unsupported column types** – You can't use the `reg` data types in any database tables that you plan to transport with this method. These types depend on system catalog object IDs (OIDs), which often change during transport.
- **Tablespaces** – All source database objects must be in the default `pg_default` tablespace.
- **Compatibility** – Both the source and destination DB instances must run the same major version of PostgreSQL.

Before transport begins, the `transport.import_from_server` function compares the source and destination DB instances to ensure database compatibility. This includes verifying PostgreSQL major version compatibility. Also, the function verifies that the destination DB instance likely has enough space to receive the source database. The function performs several additional checks to make sure that the transport is smooth.

- **Extensions** – The only extension that you can install on the source DB instance during transport is `pg_transport`.
- **Roles and ACLs** – The source database's access privileges and ownership information aren't carried over to the destination database. All database objects are created and owned by the local destination user of the transport.
- **Concurrent transports** – You can run up to 32 total transports at the same time on a DB instance, including both imports and exports. To define the worker processes used for each transport, use the `pg_transport.work_mem` and `pg_transport.num_workers` parameters. To accommodate concurrent transports, you might need to increase the `max_worker_processes` parameter quite a bit. For more information, see [Configuration parameters for the pg\\_transport extension \(p. 1604\)](#).

## Setting up to transport PostgreSQL databases

To prepare to transport a PostgreSQL database from one DB instance to another, take the following steps.

### To set up for transporting a PostgreSQL database

1. Make sure that the source DB instance's security group allows inbound traffic from the destination DB instance. This is required because the destination DB instance starts the database transport with an import call to the source DB instance. For information about how to use security groups, see [Controlling access with security groups \(p. 1737\)](#).
2. For both the source and destination DB instances, add `pg_transport` to the `shared_preload_libraries` parameter for each parameter group. The `shared_preload_libraries` parameter is static and requires a database restart for changes to take effect. For information about parameter groups, see [Working with DB parameter groups \(p. 229\)](#).
3. For both the source and destination DB instances, install the required `pg_transport` PostgreSQL extension.

To do so, start `psql` as a user with the `rds_superuser` role for each DB instance, and then run the following command.

```
psql=> CREATE EXTENSION pg_transport;
```

## Transporting a PostgreSQL database using the `transport.import_from_server` function

After you complete the process described in [Setting up to transport PostgreSQL databases \(p. 1602\)](#), you can start the transport. To do so, run the `transport.import_from_server` (p. 1604) function on the destination DB instance.

### Note

Both the destination user for transport and the source user for the connection must be members of the `rds_superuser` role.

The destination DB instance can't already contain a database with the same name as the source database to be transported, or the transport fails.

The following shows an example transport.

```
SELECT transport.import_from_server(
 'source-db-instance-endpoint',
 'source-db-instance-port',
 'source-db-instance-user',
 'source-user-password',
 'source-database-name',
 'destination-user-password',
 false);
```

This function requires that you provide database user passwords. Thus, we recommend that you change the passwords of the user roles you used after transport is complete. Or, you can use SQL bind variables to create temporary user roles. Use these temporary roles for the transport and then discard the roles afterwards.

For details of the `transport.import_from_server` function and its parameters, see [transport.import\\_from\\_server function reference \(p. 1604\)](#).

## What happens during database transport

The `transport.import_from_server` function creates the in-transit database on the destination DB instance. The in-transit database is inaccessible on the destination DB instance for the duration of the transport.

When transport begins, all current sessions on the source database are ended. Any databases other than the source database on the source DB instance aren't affected by the transport.

The source database is put into a special read-only mode. While it's in this mode, you can connect to the source database and run read-only queries. However, write-enabled queries and some other types of commands are blocked. Only the specific source database that is being transported is affected by these restrictions.

During transport, you can't restore the destination DB instance to a point in time. This is because the transport isn't transactional and doesn't use the PostgreSQL write-ahead log to record changes. If the destination DB instance has automatic backups enabled, a backup is automatically taken after transport completes. Point-in-time restores are available for times after the backup finishes.

If the transport fails, the `pg_transport` extension attempts to undo all changes to the source and destination DB instances. This includes removing the destination's partially transported database. Depending on the type of failure, the source database might continue to reject write-enabled queries. If this happens, use the following command to allow write-enabled queries.

```
ALTER DATABASE my-database SET default_transaction_read_only = false;
```

## transport.import\_from\_server function reference

The `transport.import_from_server` function transports a PostgreSQL database by importing it from a source DB instance to a destination DB instance. It does this by using a physical database connection transport mechanism.

### Syntax

```
transport.import_from_server(
 host text,
 port int,
 username text,
 password text,
 database text,
 local_password text,
 dry_run bool
)
```

### Return Value

None.

### Parameters

You can find descriptions of the `transport.import_from_server` function parameters in the following table.

Parameter	Description
<code>host</code>	The endpoint of the source DB instance.
<code>port</code>	An integer representing the port of the source DB instance. PostgreSQL DB instances often use port 5432.
<code>username</code>	The user of the source DB instance. This user must be a member of the <code>rds_superuser</code> role.
<code>password</code>	The user password of the source DB instance.
<code>database</code>	The name of the database in the source DB instance to transport.
<code>local_password</code>	The local password of the current user for the destination DB instance. This user must be a member of the <code>rds_superuser</code> role.
<code>dry_run</code>	An optional Boolean value specifying whether to perform a dry run. The default is <code>false</code> , which means the transport proceeds. To confirm compatibility between the source and destination DB instances without performing the actual transport, set <code>dry_run</code> to <code>true</code> .

### Example

For an example, see [Transporting a PostgreSQL database using the `transport.import\_from\_server` function \(p. 1603\)](#).

## Configuration parameters for the `pg_transport` extension

Use the following parameters to configure the `pg_transport` extension behavior.

```
SET pg_transport.num_workers = integer;
SET pg_transport.work_mem = kilobytes;
SET pg_transport.timing = Boolean;
```

You can find descriptions of these parameters in the following table.

Parameter	Description
<code>pg_transport.num_workers</code>	<p>The number of workers to use for a physical transport. The default is 3. Valid values are 1–32. Even large transports typically reach their maximum throughput with fewer than 8 workers.</p> <p>During transport, the <code>pg_transport.num_workers</code> setting on the destination DB instance is used on both the destination and source DB instances.</p> <p>A related parameter is the PostgreSQL <code>max_worker_processes</code> parameter. The transport process creates several background worker processes. Thus, your setting for the <code>pg_transport.num_workers</code> parameter might require you to set the <code>max_worker_processes</code> parameter significantly higher on both the source and destination DB instances.</p> <p>We recommend that you set <code>max_worker_processes</code> on both the source and destination DB instances to at least three times the destination DB instance's setting for the <code>pg_transport.num_workers</code> parameter. Add a few more to provide nontransport background worker processes.</p> <p>For more information about the <code>max_worker_processes</code> parameter, see the PostgreSQL documentation about <a href="#">Asynchronous behavior</a>.</p>
<code>pg_transport.timing</code>	<p>A Boolean value that specifies whether to report timing information during the transport. The default is <code>true</code>. Valid values are <code>true</code> to report timing information and <code>false</code> to disable the reporting of timing information.</p> <p>We don't recommend that you set this parameter to <code>false</code>. Disabling <code>pg_transport.timing</code> significantly reduces your ability to track the progress of transports.</p>
<code>pg_transport.work_mem</code>	<p>The maximum amount of memory to allocate for each worker. The default is 131,072 kilobytes (KB). The minimum value is 64 megabytes (65,536 KB). Valid values are in kilobytes (KBs) as binary base-2 units, where 1 KB = 1,024 bytes.</p> <p>The transport might use less memory than is specified in this parameter. Even large transports typically reach their maximum throughput with less than 256 MB (262,144 KB) of memory per worker.</p>

# Exporting data from an RDS for PostgreSQL DB instance to Amazon S3

You can query data from an RDS for PostgreSQL DB instance and export it directly into files stored in an Amazon S3 bucket. To do this, you use the `aws_s3` PostgreSQL extension that Amazon RDS provides. The upload to S3 uses server-side encryption by default.

For more information on storing data with Amazon S3, see [Create a bucket](#) in the *Amazon Simple Storage Service Getting Started Guide*.

## Note

You can save DB snapshot data to Amazon S3 using the AWS Management Console, AWS CLI, or Amazon RDS API. For more information, see [Exporting DB snapshot data to Amazon S3 \(p. 376\)](#).

## Topics

- [Overview of exporting data to Amazon S3 \(p. 1606\)](#)
- [Verify that your PostgreSQL version supports exports \(p. 1607\)](#)
- [Specifying the Amazon S3 file path to export to \(p. 1607\)](#)
- [Setting up access to an Amazon S3 bucket \(p. 1608\)](#)
- [Exporting query data using the `aws\_s3.query\_export\_to\_s3` function \(p. 1610\)](#)
- [Troubleshooting access to Amazon S3 \(p. 1612\)](#)
- [Function reference \(p. 1612\)](#)

## Overview of exporting data to Amazon S3

To export data stored in an RDS for PostgreSQL database to an Amazon S3 bucket, use the following procedure.

### To export RDS for PostgreSQL data to S3

1. Ensure that your version of RDS for PostgreSQL supports Amazon S3 exports. Currently, exports are supported for PostgreSQL 10.14, 11.9, 12.4 and later.
2. Install the required PostgreSQL extensions. These include the `aws_s3` and `aws_commons` extensions. To do so, start `psql` and use the following commands.

```
CREATE EXTENSION IF NOT EXISTS aws_s3 CASCADE;
```

The `aws_s3` extension provides the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function that you use to export data to Amazon S3. The `aws_commons` extension is included to provide additional helper functions.

3. Identify an Amazon S3 file path to use for exporting data. For details about this process, see [Specifying the Amazon S3 file path to export to \(p. 1607\)](#).
4. Provide permission to access the Amazon S3 bucket.

To export data to an Amazon S3 file, give the RDS for PostgreSQL DB instance permission to access the Amazon S3 bucket that the export will use for storage. Doing this includes the following steps:

1. Create an IAM policy that provides access to an Amazon S3 bucket that you want to export to.
2. Create an IAM role.
3. Attach the policy you created to the role you created.

4. Add this IAM role to your DB instance.

For details about this process, see [Setting up access to an Amazon S3 bucket \(p. 1608\)](#).

5. Identify a database query to get the data. Export the query data by calling the `aws_s3.query_export_to_s3` function.

After you complete the preceding preparation tasks, use the `aws_s3.query_export_to_s3` (p. 1613) function to export query results to Amazon S3. For details about this process, see [Exporting query data using the aws\\_s3.query\\_export\\_to\\_s3 function \(p. 1610\)](#).

## Verify that your PostgreSQL version supports exports

Currently, Amazon S3 exports are supported for PostgreSQL 10.14, 11.9, and 12.4 and later. You can also verify support by using the `describe-db-engine-versions` command. The following example verify support for version 10.14.

```
aws rds describe-db-engine-versions --region us-east-1 \
--engine postgres --engine-version 10.14 | grep s3Export
```

If the output includes the string "s3Export", then the engine supports Amazon S3 exports. Otherwise, the engine doesn't support them.

## Specifying the Amazon S3 file path to export to

Specify the following information to identify the location in Amazon S3 where you want to export data to:

- Bucket name – A *bucket* is a container for Amazon S3 objects or files.

For more information on storing data with Amazon S3, see [Create a bucket](#) and [View an object](#) in the *Amazon Simple Storage Service Getting Started Guide*.

- File path – The file path identifies where the export is stored in the Amazon S3 bucket. The file path consists of the following:
  - An optional path prefix that identifies a virtual folder path.
  - A file prefix that identifies one or more files to be stored. Larger exports are stored in multiple files, each with a maximum size of approximately 6 GB. The additional file names have the same file prefix but with `_partXX` appended. The `XX` represents 2, then 3, and so on.

For example, a file path with an `exports` folder and a `query-1-export` file prefix is `/exports/query-1-export`.

- AWS Region (optional) – The AWS Region where the Amazon S3 bucket is located. If you don't specify an AWS Region value, then Amazon RDS saves your files into Amazon S3 in the same AWS Region as the exporting DB instance.

### Note

Currently, the AWS Region must be the same as the region of the exporting DB instance.

For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

To hold the Amazon S3 file information about where the export is to be stored, you can use the `aws_commons.create_s3_uri` (p. 1615) function to create an `aws_commons._s3_uri_1` composite structure as follows.

```
psql=> SELECT aws_commons.create_s3_uri(
 'sample-bucket',
 'samplefilepath',
 'us-west-2'
) AS s3_uri_1 \gset
```

You later provide this `s3_uri_1` value as a parameter in the call to the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function. For examples, see [Exporting query data using the aws\\_s3.query\\_export\\_to\\_s3 function \(p. 1610\)](#).

## Setting up access to an Amazon S3 bucket

To export data to Amazon S3, give your PostgreSQL DB instance permission to access the Amazon S3 bucket that the files are to go in.

To do this, use the following procedure.

### To give a PostgreSQL DB instance access to Amazon S3 through an IAM role

1. Create an IAM policy.

This policy provides the bucket and object permissions that allow your PostgreSQL DB instance to access Amazon S3.

As part of creating this policy, take the following steps:

- a. Include in the policy the following required actions to allow the transfer of files from your PostgreSQL DB instance to an Amazon S3 bucket:
  - `s3:PutObject`
  - `s3:AbortMultipartUpload`
- b. Include the Amazon Resource Name (ARN) that identifies the Amazon S3 bucket and objects in the bucket. The ARN format for accessing Amazon S3 is: `arn:aws:s3:::your-s3-bucket/*`

For more information on creating an IAM policy for Amazon RDS for PostgreSQL, see [Creating and using an IAM policy for IAM database access \(p. 1702\)](#). See also [Tutorial: Create and attach your first customer managed policy](#) in the *IAM User Guide*.

The following AWS CLI command creates an IAM policy named `rds-s3-export-policy` with these options. It grants access to a bucket named `your-s3-bucket`.

**Warning**

We recommend that you set up your database within a private VPC that has endpoint policies configured for accessing specific buckets. For more information, see [Using endpoint policies for Amazon S3](#) in the Amazon VPC User Guide.

We strongly recommend that you do not create a policy with all-resource access. This access can pose a threat for data security. If you create a policy that gives `S3:PutObject` access to all resources using `"Resource": "*"`, then a user with export privileges can export data to all buckets in your account. In addition, the user can export data to *any publicly writable bucket within your AWS Region*.

After you create the policy, note the Amazon Resource Name (ARN) of the policy. You need the ARN for a subsequent step when you attach the policy to an IAM role.

```
aws iam create-policy --policy-name rds-s3-export-policy --policy-document '{
 "Version": "2012-10-17",
 "Statement": [
```

```
{
 "Sid": "s3export",
 "Action": [
 "S3:PutObject"
],
 "Effect": "Allow",
 "Resource": [
 "arn:aws:s3:::your-s3-bucket/*"
]
}
}'
```

2. Create an IAM role.

You do this so Amazon RDS can assume this IAM role on your behalf to access your Amazon S3 buckets. For more information, see [Creating a role to delegate permissions to an IAM user](#) in the *IAM User Guide*.

The following example shows using the AWS CLI command to create a role named `rds-s3-export-role`.

```
aws iam create-role --role-name rds-s3-export-role --assume-role-policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]
}'
```

3. Attach the IAM policy that you created to the IAM role that you created.

The following AWS CLI command attaches the policy created earlier to the role named `rds-s3-export-role`. Replace `your-policy-arn` with the policy ARN that you noted in an earlier step.

```
aws iam attach-role-policy --policy-arn your-policy-arn --role-name rds-s3-export-role
```

4. Add the IAM role to the DB instance. You do so by using the AWS Management Console or AWS CLI, as described following.

## Console

### To add an IAM role for a PostgreSQL DB instance using the console

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. Choose the PostgreSQL DB instance name to display its details.
3. On the **Connectivity & security** tab, in the **Manage IAM roles** section, choose the role to add under **Add IAM roles to this instance**.
4. Under **Feature**, choose **s3Export**.
5. Choose **Add role**.

## AWS CLI

### To add an IAM role for a PostgreSQL DB instance using the CLI

- Use the following command to add the role to the PostgreSQL DB instance named `my-db-instance`. Replace `your-role-arn` with the role ARN that you noted in a previous step. Use `s3Export` for the value of the `--feature-name` option.

#### Example

For Linux, macOS, or Unix:

```
aws rds add-role-to-db-instance \
 --db-instance-identifier my-db-instance \
 --feature-name s3Export \
 --role-arn your-role-arn \
 --region your-region
```

For Windows:

```
aws rds add-role-to-db-instance ^
 --db-instance-identifier my-db-instance ^
 --feature-name s3Export ^
 --role-arn your-role-arn ^
 --region your-region
```

## Exporting query data using the aws\_s3.query\_export\_to\_s3 function

Export your PostgreSQL data to Amazon S3 by calling the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function.

### Topics

- [Prerequisites \(p. 1610\)](#)
- [Calling aws\\_s3.query\\_export\\_to\\_s3 \(p. 1611\)](#)
- [Exporting to a CSV file that uses a custom delimiter \(p. 1612\)](#)
- [Exporting to a binary file with encoding \(p. 1612\)](#)

## Prerequisites

Before you use the `aws_s3.query_export_to_s3` function, be sure to complete the following prerequisites:

- Install the required PostgreSQL extensions as described in [Overview of exporting data to Amazon S3 \(p. 1606\)](#).
- Determine where to export your data to Amazon S3 as described in [Specifying the Amazon S3 file path to export to \(p. 1607\)](#).
- Make sure that the DB instance has export access to Amazon S3 as described in [Setting up access to an Amazon S3 bucket \(p. 1608\)](#).

The examples following use a database table called `sample_table`. These examples export the data into a bucket called `sample-bucket`. The example table and data are created with the following SQL statements in psql.

```
psql=> CREATE TABLE sample_table (bid bigint PRIMARY KEY, name varchar(80));
psql=> INSERT INTO sample_table (bid, name) VALUES (1, 'Monday'), (2, 'Tuesday'), (3, 'Wednesday');
```

## Calling aws\_s3.query\_export\_to\_s3

The following shows the basic ways of calling the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function.

These examples use the variable `s3_uri_1` to identify a structure that contains the information identifying the Amazon S3 file. Use the [aws\\_commons.create\\_s3\\_uri \(p. 1615\)](#) function to create the structure.

```
psql=> SELECT aws_commons.create_s3_uri(
 'sample-bucket',
 'samplefilepath',
 'us-west-2'
) AS s3_uri_1 \gset
```

Although the parameters vary for the following two `aws_s3.query_export_to_s3` function calls, the results are the same for these examples. All rows of the `sample_table` table are exported into a bucket called `sample-bucket`.

```
psql=> SELECT * FROM aws_s3.query_export_to_s3('SELECT * FROM sample_table', :'s3_uri_1');
psql=> SELECT * FROM aws_s3.query_export_to_s3('SELECT * FROM sample_table', :'s3_uri_1',
 options := 'format text');
```

The parameters are described as follows:

- `'SELECT * FROM sample_table'` – The first parameter is a required text string containing an SQL query. The PostgreSQL engine runs this query. The results of the query are copied to the S3 bucket identified in other parameters.
- `:'s3_uri_1'` – This parameter is a structure that identifies the Amazon S3 file. This example uses a variable to identify the previously created structure. You can instead create the structure by including the `aws_commons.create_s3_uri` function call inline within the `aws_s3.query_export_to_s3` function call as follows.

```
SELECT * from aws_s3.query_export_to_s3('select * from sample_table',
 aws_commons.create_s3_uri('sample-bucket', 'samplefilepath', 'us-west-2')
);
```

- `options := 'format text'` – The `options` parameter is an optional text string containing PostgreSQL `COPY` arguments. The copy process uses the arguments and format of the [PostgreSQL COPY command](#).

If the file specified doesn't exist in the Amazon S3 bucket, it's created. If the file already exists, it's overwritten. The syntax for accessing the exported data in Amazon S3 is the following.

```
s3-region://bucket-name[/path-prefix]/file-prefix
```

Larger exports are stored in multiple files, each with a maximum size of approximately 6 GB. The additional file names have the same file prefix but with `_partXX` appended. The `XX` represents 2, then 3, and so on. For example, suppose that you specify the path where you store data files as the following.

```
s3-us-west-2://my-bucket/my-prefix
```

If the export has to create three data files, the Amazon S3 bucket contains the following data files.

```
s3-us-west-2://my-bucket/my-prefix
s3-us-west-2://my-bucket/my-prefix_part2
s3-us-west-2://my-bucket/my-prefix_part3
```

For the full reference for this function and additional ways to call it, see [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#). For more about accessing files in Amazon S3, see [View an object](#) in the *Amazon Simple Storage Service Getting Started Guide*.

## Exporting to a CSV file that uses a custom delimiter

The following example shows how to call the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function to export data to a file that uses a custom delimiter. The example uses arguments of the [PostgreSQL COPY](#) command to specify the comma-separated value (CSV) format and a colon (:) delimiter.

```
SELECT * from aws_s3.query_export_to_s3('select * from basic_test', :'s3_uri_1',
options :='format csv, delimiter $$:$$');
```

## Exporting to a binary file with encoding

The following example shows how to call the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function to export data to a binary file that has Windows-1253 encoding.

```
SELECT * from aws_s3.query_export_to_s3('select * from basic_test', :'s3_uri_1',
options :='format binary, encoding WIN1253');
```

## Troubleshooting access to Amazon S3

If you encounter connection problems when attempting to export data to Amazon S3, first confirm that the outbound access rules for the VPC security group associated with your DB instance permit network connectivity. Specifically, they must allow access to port 443 for SSL connections. For more information, see [Provide access to your DB instance in your VPC by creating a security group \(p. 69\)](#).

See also the following for recommendations:

- [Troubleshooting Amazon RDS identity and access \(p. 1727\)](#)
- [Troubleshooting Amazon S3 in the \*Amazon Simple Storage Service Developer Guide\*](#).
- [Troubleshooting Amazon S3 and IAM in the \*IAM User Guide\*](#).

## Function reference

### Functions

- [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#)
- [aws\\_commons.create\\_s3\\_uri \(p. 1615\)](#)

## aws\_s3.query\_export\_to\_s3

Exports a PostgreSQL query result to an Amazon S3 bucket. The `aws_s3` extension provides the `aws_s3.query_export_to_s3` function.

The two required parameters are `query` and `s3_info`. These define the query to be exported and identify the Amazon S3 bucket to export to. An optional parameter called `options` provides for defining various export parameters. For examples of using the `aws_s3.query_export_to_s3` function, see [Exporting query data using the aws\\_s3.query\\_export\\_to\\_s3 function \(p. 1610\)](#).

### Syntax

```
aws_s3.query_export_to_s3(
 query text,
 s3_info aws_commons._s3_uri_1,
 options text
)
```

### Input parameters

#### `query`

A required text string containing an SQL query that the PostgreSQL engine runs. The results of this query are copied to an S3 bucket identified in the `s3_info` parameter.

#### `s3_info`

An `aws_commons._s3_uri_1` composite type containing the following information about the S3 object:

- `bucket` – The name of the Amazon S3 bucket to contain the file.
- `file_path` – The Amazon S3 file name and path.
- `region` – The AWS Region that the bucket is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

Currently, this value must be the same AWS Region as that of the exporting DB instance. The default is the AWS Region of the exporting DB instance.

To create an `aws_commons._s3_uri_1` composite structure, see the [aws\\_commons.create\\_s3\\_uri \(p. 1615\)](#) function.

#### `options`

An optional text string containing arguments for the PostgreSQL `COPY` command. These arguments specify how the data is to be copied when exported. For more details, see the [PostgreSQL COPY documentation](#).

### Alternate input parameters

To help with testing, you can use an expanded set of parameters instead of the `s3_info` parameter. Following are additional syntax variations for the `aws_s3.query_export_to_s3` function.

Instead of using the `s3_info` parameter to identify an Amazon S3 file, use the combination of the `bucket`, `file_path`, and `region` parameters.

```
aws_s3.query_export_to_s3(
 query text,
 bucket text,
 file_path text,
```

```
 region text,
 options text
)
```

*query*

A required text string containing an SQL query that the PostgreSQL engine runs. The results of this query are copied to an S3 bucket identified in the *s3\_info* parameter.

*bucket*

A required text string containing the name of the Amazon S3 bucket that contains the file.

*file\_path*

A required text string containing the Amazon S3 file name including the path of the file.

*region*

An optional text string containing the AWS Region that the bucket is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

Currently, this value must be the same AWS Region as that of the exporting DB instance. The default is the AWS Region of the exporting DB instance.

*options*

An optional text string containing arguments for the PostgreSQL `COPY` command. These arguments specify how the data is to be copied when exported. For more details, see the [PostgreSQL COPY documentation](#).

## Output parameters

```
aws_s3.query_export_to_s3(
 OUT rows_uploaded bigint,
 OUT files_uploaded bigint,
 OUT bytes_uploaded bigint
)
```

*rows\_uploaded*

The number of table rows that were successfully uploaded to Amazon S3 for the given query.

*files\_uploaded*

The number of files uploaded to Amazon S3. Files are created in sizes of approximately 6 GB. Each additional file created has `_partXX` appended to the name. The `XX` represents 2, then 3, and so on as needed.

*bytes\_uploaded*

The total number of bytes uploaded to Amazon S3.

## Examples

```
psql=> SELECT * from aws_s3.query_export_to_s3('select * from sample_table', 'sample-
bucket', 'sample-filepath');
psql=> SELECT * from aws_s3.query_export_to_s3('select * from sample_table', 'sample-
bucket', 'sample-filepath','us-west-2');
psql=> SELECT * from aws_s3.query_export_to_s3('select * from sample_table', 'sample-
bucket', 'sample-filepath','us-west-2','format text');
```

## aws\_commons.create\_s3\_uri

Creates an `aws_commons._s3_uri_1` structure to hold Amazon S3 file information. You use the results of the `aws_commons.create_s3_uri` function in the `s3_info` parameter of the [aws\\_s3.query\\_export\\_to\\_s3 \(p. 1613\)](#) function. For an example of using the `aws_commons.create_s3_uri` function, see [Specifying the Amazon S3 file path to export to \(p. 1607\)](#).

### Syntax

```
aws_commons.create_s3_uri(
 bucket text,
 file_path text,
 region text
)
```

### Input parameters

*bucket*

A required text string containing the Amazon S3 bucket name for the file.

*file\_path*

A required text string containing the Amazon S3 file name including the path of the file.

*region*

A required text string containing the AWS Region that the file is in. For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

# Common DBA tasks for PostgreSQL

This section describes the Amazon RDS implementations of some common DBA tasks for DB instances running the PostgreSQL database engine. To deliver a managed service experience, Amazon RDS doesn't provide shell access to DB instances, and it restricts access to certain system procedures and tables that require advanced privileges.

For information about working with PostgreSQL log files on Amazon RDS, see [PostgreSQL database log files \(p. 557\)](#).

## Creating roles

When you create a DB instance, the master user system account that you create is assigned to the `rds_superuser` role. The `rds_superuser` role is a predefined Amazon RDS role similar to the PostgreSQL superuser role (customarily named `postgres` in local instances), but with some restrictions. As with the PostgreSQL superuser role, the `rds_superuser` role has the most privileges for your DB instance. You should not assign this role to users unless they need the most access to the DB instance.

The `rds_superuser` role can do the following:

- Add extensions that are available for use with Amazon RDS. For more information, see [Some supported PostgreSQL features \(p. 1537\)](#) and the [PostgreSQL documentation](#).
- Manage tablespaces, including creating and deleting them. For more information, see [Tablespaces for PostgreSQL on Amazon RDS \(p. 1543\)](#) and the [Tablespaces](#) section in the PostgreSQL documentation.
- View all users not assigned the `rds_superuser` role using the `pg_stat_activity` command and stop their connections using the `pg_terminate_backend` and `pg_cancel_backend` commands.
- Grant and revoke the `rds_replication` role for all roles that are not the `rds_superuser` role. For more information, see the [GRANT](#) section in the PostgreSQL documentation.

The following example shows how to create a user and then grant the user the `rds_superuser` role. User-defined roles, such as `rds_superuser`, have to be granted.

```
create role testuser with password 'testuser' login;
grant rds_superuser to testuser;
```

## Managing PostgreSQL database access

In Amazon RDS for PostgreSQL, you can manage which users have privileges to connect to which databases. In other PostgreSQL environments, you sometimes perform this kind of management by modifying the `pg_hba.conf` file. In Amazon RDS, you can use database grants instead.

New databases in PostgreSQL are always created with a default set of privileges. The default privileges allow `PUBLIC` (all users) to connect to the database and to create temporary tables while connected.

To control which users are allowed to connect to a given database in Amazon RDS, first revoke the default `PUBLIC` privileges. Then grant back the privileges on a more granular basis. The following example code shows how.

```
psql> revoke all on database <database-name> from public;
psql> grant connect, temporary on database <database-name> to <user/role name>;
```

For more information about privileges in PostgreSQL databases, see the [GRANT](#) command in the PostgreSQL documentation.

## Working with PostgreSQL parameters

PostgreSQL parameters that you set for a local PostgreSQL instance in the `postgresql.conf` file are maintained in the DB parameter group for your DB instance. If you create a DB instance using the default parameter group, the parameter settings are in the parameter group called `default.postgres9.6`.

When you create a DB instance, the parameters in the associated DB parameter group are loaded. You can modify parameter values by changing values in the parameter group. You can also change parameter values, if you have the security privileges to do so, by using the `ALTER DATABASE`, `ALTER ROLE`, and `SET` commands. You can't use the command line `postgres` command or the `env PGOPTIONS` command, because you have no access to the host.

Keeping track of PostgreSQL parameter settings can occasionally be difficult. Use the following command to list current parameter settings and the default value.

```
select name, setting, boot_val, reset_val, unit
from pg_settings
order by name;
```

For an explanation of the output values, see the [pg\\_settings](#) topic in the PostgreSQL documentation.

If you set the memory settings too large for `max_connections` or `shared_buffers`, you will prevent the PostgreSQL instance from starting up. Some parameters use units that you might not be familiar with; for example, `shared_buffers` sets the number of 8-KB shared memory buffers used by the server.

The following error is written to the `postgres.log` file when the instance is attempting to start up, but incorrect parameter settings are preventing it from starting.

```
2013-09-18 21:13:15 UTC::@[8097]:FATAL: could not map anonymous shared
memory: Cannot allocate memory
2013-09-18 21:13:15 UTC::@[8097]:HINT: This error usually means that
PostgreSQL's request for a shared memory segment exceeded available memory or
swap space. To reduce the request size (currently 3514134274048 bytes), reduce
PostgreSQL's shared memory usage, perhaps by reducing shared_buffers or
```

max\_connections.

There are two types of PostgreSQL parameters, static and dynamic. Static parameters require that the DB instance be rebooted before they are applied. Dynamic parameters can be applied immediately. The following table shows parameters that you can modify for a PostgreSQL DB instance and each parameter's type.

Parameter name	Apply_Type	Description
application_name	Dynamic	Sets the application name to be reported in statistics and logs.
array_nulls	Dynamic	Enables input of NULL elements in arrays.
authentication_timeout	Dynamic	Sets the maximum allowed time to complete client authentication.
autovacuum	Dynamic	Starts the autovacuum subprocess.
autovacuum_analyze_scale_factor	Dynamic	Number of tuple inserts, updates, or deletes before analyze as a fraction of reltuples.
autovacuum_analyze_threshold	Dynamic	Minimum number of tuple inserts, updates, or deletes before analyze.
autovacuum_naptime	Dynamic	Time to sleep between autovacuum runs.
autovacuum_vacuum_cost_delay	Dynamic	Vacuum cost delay, in milliseconds, for autovacuum.
autovacuum_vacuum_cost_limit	Dynamic	Vacuum cost amount available before napping, for autovacuum.
autovacuum_vacuum_scale_factor	Dynamic	Number of tuple updates or deletes before vacuum as a fraction of reltuples.
autovacuum_vacuum_threshold	Dynamic	Minimum number of tuple updates or deletes before vacuum.
backslash_quote	Dynamic	Sets whether a backslash (\) is allowed in string literals.
bgwriter_delay	Dynamic	Background writer sleep time between rounds.
bgwriter_lru_maxpages	Dynamic	Background writer maximum number of LRU pages to flush per round.
bgwriter_lru_multiplier	Dynamic	Multiple of the average buffer usage to free per round.
bytea_output	Dynamic	Sets the output format for bytes.
check_function_bodies	Dynamic	Checks function bodies during CREATE FUNCTION.
checkpoint_completion_target	Dynamic	Time spent flushing dirty buffers during checkpoint, as a fraction of the checkpoint interval.
checkpoint_segments	Dynamic	Sets the maximum distance in log segments between automatic write-ahead log (WAL) checkpoints.
checkpoint_timeout	Dynamic	Sets the maximum time between automatic WAL checkpoints.

Parameter name	Apply_Type	Description
checkpoint_warning	Dynamic	Enables warnings if checkpoint segments are filled more frequently than this.
client_encoding	Dynamic	Sets the client's character set encoding.
client_min_messages	Dynamic	Sets the message levels that are sent to the client.
commit_delay	Dynamic	Sets the delay in microseconds between transaction commit and flushing WAL to disk.
commit_siblings	Dynamic	Sets the minimum concurrent open transactions before performing commit_delay.
constraint_exclusion	Dynamic	Enables the planner to use constraints to optimize queries.
cpu_index_tuple_cost	Dynamic	Sets the planner's estimate of the cost of processing each index entry during an index scan.
cpu_operator_cost	Dynamic	Sets the planner's estimate of the cost of processing each operator or function call.
cpu_tuple_cost	Dynamic	Sets the planner's estimate of the cost of processing each tuple (row).
cursor_tuple_fraction	Dynamic	Sets the planner's estimate of the fraction of a cursor's rows that will be retrieved.
datestyle	Dynamic	Sets the display format for date and time values.
deadlock_timeout	Dynamic	Sets the time to wait on a lock before checking for deadlock.
debug_pretty_print	Dynamic	Indents parse and plan tree displays.
debug_print_parse	Dynamic	Logs each query's parse tree.
debug_print_plan	Dynamic	Logs each query's execution plan.
debug_print_rewritten	Dynamic	Logs each query's rewritten parse tree.
default_statistics_target	Dynamic	Sets the default statistics target.
default_tablespace	Dynamic	Sets the default tablespace to create tables and indexes in.
default_transaction_deferrable	Dynamic	Sets the default deferrable status of new transactions.
default_transaction_isolation	Dynamic	Sets the transaction isolation level of each new transaction.
default_transaction_read_only	Dynamic	Sets the default read-only status of new transactions.
default_with_oids	Dynamic	Creates new tables with OIDs by default.
effective_cache_size	Dynamic	Sets the planner's assumption about the size of the disk cache.

Parameter name	Apply_Type	Description
effective_io_concurrency	Dynamic	Number of simultaneous requests that can be handled efficiently by the disk subsystem.
enable_bitmapscan	Dynamic	Enables the planner's use of bitmap-scan plans.
enable_hashagg	Dynamic	Enables the planner's use of hashed aggregation plans.
enable_hashjoin	Dynamic	Enables the planner's use of hash join plans.
enable_indexscan	Dynamic	Enables the planner's use of index-scan plans.
enable_material	Dynamic	Enables the planner's use of materialization.
enable_mergejoin	Dynamic	Enables the planner's use of merge join plans.
enable_nestloop	Dynamic	Enables the planner's use of nested-loop join plans.
enable_seqscan	Dynamic	Enables the planner's use of sequential-scan plans.
enable_sort	Dynamic	Enables the planner's use of explicit sort steps.
enable_tidscan	Dynamic	Enables the planner's use of TID scan plans.
escape_string_warning	Dynamic	Warns about backslash (\) escapes in ordinary string literals.
extra_float_digits	Dynamic	Sets the number of digits displayed for floating-point values.
fromCollapse_limit	Dynamic	Sets the FROM-list size beyond which subqueries are not collapsed.
fsync	Dynamic	Forces synchronization of updates to disk.
full_page_writes	Dynamic	Writes full pages to WAL when first modified after a checkpoint.
geqo	Dynamic	Enables genetic query optimization.
geqo_effort	Dynamic	GEQO: effort is used to set the default for other GEQO parameters.
geqo_generations	Dynamic	GEQO: number of iterations of the algorithm.
geqo_pool_size	Dynamic	GEQO: number of individuals in the population.
geqo_seed	Dynamic	GEQO: seed for random path selection.
geqo_selection_bias	Dynamic	GEQO: selective pressure within the population.
geqo_threshold	Dynamic	Sets the threshold of FROM items beyond which GEQO is used.
gin_fuzzy_search_limit	Dynamic	Sets the maximum allowed result for exact search by GIN.
hot_standby_feedback	Dynamic	Determines whether a hot standby sends feedback messages to the primary or upstream standby.

Parameter name	Apply_Type	Description
intervalstyle	Dynamic	Sets the display format for interval values.
joinCollapse_limit	Dynamic	Sets the FROM-list size beyond which JOIN constructs are not flattened.
lc_messages	Dynamic	Sets the language in which messages are displayed.
lc_monetary	Dynamic	Sets the locale for formatting monetary amounts.
lc_numeric	Dynamic	Sets the locale for formatting numbers.
lc_time	Dynamic	Sets the locale for formatting date and time values.
log_autovacuum_min_duration	Dynamic	Sets the minimum running time above which autovacuum actions will be logged.
log_checkpoints	Dynamic	Logs each checkpoint.
log_connections	Dynamic	Logs each successful connection.
log_disconnections	Dynamic	Logs end of a session, including duration.
log_duration	Dynamic	Logs the duration of each completed SQL statement.
log_error_verbosity	Dynamic	Sets the verbosity of logged messages.
log_executor_stats	Dynamic	Writes executor performance statistics to the server log.
log_filename	Dynamic	Sets the file name pattern for log files.
log_hostname	Dynamic	Logs the host name in the connection logs.
log_lock_waits	Dynamic	Logs long lock waits.
log_min_duration_statement	Dynamic	Sets the minimum running time above which statements will be logged.
log_min_error_statement	Dynamic	Causes all statements generating an error at or above this level to be logged.
log_min_messages	Dynamic	Sets the message levels that are logged.
log_parser_stats	Dynamic	Writes parser performance statistics to the server log.
log_planner_stats	Dynamic	Writes planner performance statistics to the server log.
log_rotation_age	Dynamic	Automatic log file rotation will occur after N minutes.
log_rotation_size	Dynamic	Automatic log file rotation will occur after N kilobytes.
log_statement	Dynamic	Sets the type of statements logged.
log_statement_stats	Dynamic	Writes cumulative performance statistics to the server log.
log_temp_files	Dynamic	Logs the use of temporary files larger than this number of kilobytes.

Parameter name	Apply_Type	Description
<code>maintenance_work_mem</code>	Dynamic	Sets the maximum memory to be used for maintenance operations.
<code>max_stack_depth</code>	Dynamic	Sets the maximum stack depth, in kilobytes.
<code>max_standby_archive_delay</code>	Dynamic	Sets the maximum delay before canceling queries when a hot standby server is processing archived WAL data.
<code>max_standby_streaming_delay</code>	Dynamic	Sets the maximum delay before canceling queries when a hot standby server is processing streamed WAL data.
<code>max_wal_size</code>	Static	Sets the WAL size that triggers the checkpoint. For PostgreSQL version 9.6 and earlier, <code>max_wal_size</code> is in units of 16 MB. For PostgreSQL version 10 and later, <code>max_wal_size</code> is in units of 1 MB.
<code>min_wal_size</code>	Static	Sets the minimum size to shrink the WAL to. For PostgreSQL version 9.6 and earlier, <code>min_wal_size</code> is in units of 16 MB. For PostgreSQL version 10 and later, <code>min_wal_size</code> is in units of 1 MB.
<code>quote_all_identifiers</code>	Dynamic	Adds quotes ("") to all identifiers when generating SQL fragments.
<code>random_page_cost</code>	Dynamic	Sets the planner's estimate of the cost of a non-sequentially fetched disk page.
<code>rds.adaptive_autovacuum</code>	Dynamic	Automatically tunes the autovacuum parameters whenever the transaction ID thresholds are exceeded.
<code>rds.log_retention_period</code>	Dynamic	Sets log retention such that Amazon RDS deletes PostgreSQL logs that are older than N minutes.
<code>rds.restrict_password_commands</code>	Static	Restricts who can manage passwords to users with the <code>rds_password</code> role. Set this parameter to 1 to enable password restriction. The default is 0.
<code>search_path</code>	Dynamic	Sets the schema search order for names that are not schema-qualified.
<code>seq_page_cost</code>	Dynamic	Sets the planner's estimate of the cost of a sequentially fetched disk page.
<code>session_replication_role</code>	Dynamic	Sets the sessions behavior for triggers and rewrite rules.
<code>sql_inheritance</code>	Dynamic	Causes subtables to be included by default in various commands.
<code>ssl_renegotiation_limit</code>	Dynamic	Sets the amount of traffic to send and receive before renegotiating the encryption keys.
<code>standard_conforming_strings</code>	Dynamic	Causes ... strings to treat backslashes literally.
<code>statement_timeout</code>	Dynamic	Sets the maximum allowed duration of any statement.

Parameter name	Apply_Type	Description
<code>synchronize_seqscans</code>	Dynamic	Enables synchronized sequential scans.
<code>synchronous_commit</code>	Dynamic	Sets the current transactions synchronization level.
<code>tcp_keepalives_count</code>	Dynamic	Maximum number of TCP keepalive retransmits.
<code>tcp_keepalives_idle</code>	Dynamic	Time between issuing TCP keepalives.
<code>tcp_keepalives_interval</code>	Dynamic	Time between TCP keepalive retransmits.
<code>temp_buffers</code>	Dynamic	Sets the maximum number of temporary buffers used by each session.
<code>temp_tablespaces</code>	Dynamic	Sets the tablespaces to use for temporary tables and sort files.
<code>timezone</code>	Dynamic	Sets the time zone for displaying and interpreting time stamps.
<code>track_activities</code>	Dynamic	Collects information about running commands.
<code>track_counts</code>	Dynamic	Collects statistics on database activity.
<code>track_functions</code>	Dynamic	Collects function-level statistics on database activity.
<code>track_io_timing</code>	Dynamic	Collects timing statistics on database I/O activity.
<code>transaction_deferrable</code>	Dynamic	Indicates whether to defer a read-only serializable transaction until it can be started with no possible serialization failures.
<code>transaction_isolation</code>	Dynamic	Sets the current transactions isolation level.
<code>transaction_read_only</code>	Dynamic	Sets the current transactions read-only status.
<code>transform_null_equals</code>	Dynamic	Treats <code>expr=NULL</code> as <code>expr IS NULL</code> .
<code>update_process_title</code>	Dynamic	Updates the process title to show the active SQL command.
<code>vacuum_cost_delay</code>	Dynamic	Vacuum cost delay in milliseconds.
<code>vacuum_cost_limit</code>	Dynamic	Vacuum cost amount available before napping.
<code>vacuum_cost_page_dirty</code>	Dynamic	Vacuum cost for a page dirtied by vacuum.
<code>vacuum_cost_page_hit</code>	Dynamic	Vacuum cost for a page found in the buffer cache.
<code>vacuum_cost_page_miss</code>	Dynamic	Vacuum cost for a page not found in the buffer cache.
<code>vacuum_defer_cleanup_age</code>	Dynamic	Number of transactions by which vacuum and hot cleanup should be deferred, if any.
<code>vacuum_freeze_min_age</code>	Dynamic	Minimum age at which vacuum should freeze a table row.
<code>vacuum_freeze_table_age</code>	Dynamic	Age at which vacuum should scan a whole table to freeze tuples.
<code>wal_writer_delay</code>	Dynamic	WAL writer sleep time between WAL flushes.

Parameter name	Apply_Type	Description
work_mem	Dynamic	Sets the maximum memory to be used for query workspaces.
xmlbinary	Dynamic	Sets how binary values are to be encoded in XML.
xmloption	Dynamic	Sets whether XML data in implicit parsing and serialization operations is to be considered as documents or content fragments.
autovacuum_freeze_max_age	Static	Age at which to autovacuum a table to prevent transaction ID wraparound.
autovacuum_max_workers	Static	Sets the maximum number of simultaneously running autovacuum worker processes.
max_connections	Static	Sets the maximum number of concurrent connections.
max_files_per_process	Static	Sets the maximum number of simultaneously open files for each server process.
max_locks_per_transaction	Static	Sets the maximum number of locks per transaction.
max_pred_locks_per_transaction	Static	Sets the maximum number of predicate locks per transaction.
max_prepared_transactions	Static	Sets the maximum number of simultaneously prepared transactions.
shared_buffers	Static	Sets the number of shared memory buffers used by the server.
ssl	Static	Enables SSL connections.
temp_file_limit	Static	Sets the maximum size in KB to which the temporary files can grow.
track_activity_query_size	Static	Sets the size reserved for pg_stat_activity.current_query, in bytes.
wal_buffers	Static	Sets the number of disk-page buffers in shared memory for WAL.

Amazon RDS uses the default PostgreSQL units for all parameters. The following table shows the PostgreSQL default unit and value for each parameter.

Parameter name	Unit
effective_cache_size	8 KB
segment_size	8 KB
shared_buffers	8 KB
temp_buffers	8 KB
wal_buffers	8 KB

Parameter name	Unit
wal_segment_size	8 KB
log_rotation_size	KB
log_temp_files	KB
maintenance_work_mem	KB
max_stack_depth	KB
ssl_renegotiation_limit	KB
temp_file_limit	KB
work_mem	KB
log_rotation_age	minutes
autovacuum_vacuum_cost_delay	ms
bgwriter_delay	ms
deadlock_timeout	ms
lock_timeout	ms
log_autovacuum_min_duration	ms
log_min_duration_statement	ms
max_standby_archive_delay	ms
max_standby_streaming_delay	ms
statement_timeout	ms
vacuum_cost_delay	ms
wal_receiver_timeout	ms
wal_sender_timeout	ms
wal_writer_delay	ms
archive_timeout	s
authentication_timeout	s
autovacuum_naptime	s
checkpoint_timeout	s
checkpoint_warning	s
post_auth_delay	s
pre_auth_delay	s
tcp_keepalives_idle	s
tcp_keepalives_interval	s

Parameter name	Unit
wal_receiver_status_interval	s

## Audit logging for a PostgreSQL DB instance

There are several parameters you can set to log activity that occurs on your PostgreSQL DB instance. These parameters include the following:

- The `log_statement` parameter can be used to log user activity in your PostgreSQL database. For more information, see [PostgreSQL database log files \(p. 557\)](#).
- The `rds.force_admin_logging_level` parameter logs actions by the RDS internal user (`rdsadmin`) in the databases on the DB instance, and writes the output to the PostgreSQL error log. Allowed values are disabled, debug5, debug4, debug3, debug2, debug1, info, notice, warning, error, log, fatal, and panic. The default value is disabled.
- The `rds.force_autovacuum_logging_level` parameter logs autovacuum worker operations in all databases on the DB instance, and writes the output to the PostgreSQL error log. Allowed values are disabled, debug5, debug4, debug3, debug2, debug1, info, notice, warning, error, log, fatal, and panic. The default value is disabled. The Amazon RDS recommended setting for `rds.force_autovacuum_logging_level` is LOG. Set `log_autovacuum_min_duration` to a value from 1000 or 5000. Setting this value to 5,000 writes activity to the log that takes more than 5 seconds and shows "vacuum skipped" messages. For more information on this parameter, see [Best practices for working with PostgreSQL \(p. 135\)](#).

## Working with the pgaudit extension

The `pgaudit` extension provides detailed session and object audit logging for Amazon RDS for PostgreSQL version 9.6.3 and later and version 9.5.7 version and later. You can enable session auditing or object auditing using this extension.

With session auditing, you can log audit events from various sources and includes the fully qualified command text when available. For example, you can use session auditing to log all READ statements that connect to a database by setting `pgaudit.log` to `READ`.

With object auditing, you can refine the audit logging to work with specific commands. For example, you can specify that you want audit logging for READ operations on a specific number of tables.

### To use object based logging with the pgaudit extension

1. Create a database role called `rds_pgaudit` using the following command.

```
CREATE ROLE rds_pgaudit;
```

2. Modify the parameter group that is associated with your DB instance to do the following:

- Use the shared preload libraries that contain `pgaudit`.
- Set `pgaudit.role` to the role `rds_pgaudit`.

The following commands modify a custom parameter group.

```
aws rds modify-db-parameter-group \
 --db-parameter-group-name rds-parameter-group-96 \
```

```
--parameters
"ParameterName=pgaudit.role,ParameterValue=rds_pgaudit,ApplyMethod=pending-reboot" \
--region us-west-2

aws rds modify-db-parameter-group \
--db-parameter-group-name rds-parameter-group-96 \
--parameters
"ParameterName=shared_preload_libraries,ParameterValue=pgaudit,ApplyMethod=pending-
reboot" \
--region us-west-2
```

3. Reboot the instance so that the DB instance picks up the changes to the parameter group.

```
aws rds reboot-db-instance \
--db-instance-identifier rds-test-instance \
--region us-west-2
```

4. Run the following command to confirm that pgaudit has been initialized.

```
SHOW shared_preload_libraries;

shared_preload_libraries

rdsutils,pgaudit
(1 row)
```

5. Run the following command to create the pgaudit extension.

```
CREATE EXTENSION pgaudit;
```

6. Run the following command to confirm `pgaudit.role` is set to `rds_pgaudit`.

```
SHOW pgaudit.role;

pgaudit.role

rds_pgaudit
```

To test the audit logging, run several commands that you have chosen to audit. For example, you might run the following commands.

```
CREATE TABLE t1 (id int);
GRANT SELECT ON t1 TO rds_pgaudit;
SELECT * FROM t1;

id

(0 rows)
```

The database logs should contain an entry similar to the following.

```
...
2017-06-12 19:09:49 UTC:...:rds_test@postgres:[11701]:LOG: AUDIT:
OBJECT,1,1,READ,SELECT,TABLE,public.t1,select * from t1;
...
```

For information on viewing the logs, see [Working with Amazon RDS database log files \(p. 524\)](#).

## Working with the pg\_repack extension

You can use the `pg_repack` extension to remove bloat from tables and indexes. This extension is supported on Amazon RDS for PostgreSQL versions 9.6.3 and later. For more information on the `pg_repack` extension, see the [GitHub project documentation](#).

### To use the pg\_repack extension

1. Install the `pg_repack` extension on your Amazon RDS for PostgreSQL DB instance by running the following command.

```
CREATE EXTENSION pg_repack;
```

2. Run the following commands to grant write access to repack temporary log tables created by `pg_repack`.

```
ALTER DEFAULT PRIVILEGES IN SCHEMA repack GRANT INSERT ON TABLES TO PUBLIC;
ALTER DEFAULT PRIVILEGES IN SCHEMA repack GRANT USAGE, SELECT ON SEQUENCES TO PUBLIC;
```

3. Use the `pg_repack` client utility to connect to a database. Use a database role that has `rds_superuser` privileges to connect to the database. In the following connection example, the `rds_test` role has `rds_superuser` privileges, and the database endpoint used is `rds-test-instance.cw7jjfgdr4on8.us-west-2.rds.amazonaws.com`.

```
pg_repack -h rds-test-instance.cw7jjfgdr4on8.us-west-2.rds.amazonaws.com -U rds_test -k
postgres
```

Connect using the `-k` option. The `-a` option is not supported.

4. The response from the `pg_repack` client provides information on the tables on the DB instance that are repacked.

```
INFO: repacking table "pgbench_tellers"
INFO: repacking table "pgbench_accounts"
INFO: repacking table "pgbench_branches"
```

## Using pgBadger for log analysis with PostgreSQL

You can use a log analyzer such as `pgbadger` to analyze PostgreSQL logs. The `pgbadger` documentation states that the `%l` pattern (log line for session/process) should be a part of the prefix. However, if you provide the current rds log `log_line_prefix` as a parameter to `pgbadger` it should still produce a report.

For example, the following command correctly formats an Amazon RDS for PostgreSQL log file dated 2014-02-04 using `pgbadger`.

```
./pgbadger -f stderr -p '%t:%r:%u@%d:[%p]:' postgresql.log.2014-02-04-00
```

## Viewing the contents of pg\_config

In PostgreSQL version 9.6.1, you can see the compile-time configuration parameters of the currently installed version of PostgreSQL using the new view `pg_config`. You can use the view by calling the `pg_config` function as shown in the following sample.

```

select * from pg_config();
 name | setting
-----+
-----+
 BINDIR | /rdsdbbin/postgres-9.6.1.R1/bin

## Working with the orafce extension

The `orafce` extension provides functions that are common in commercial databases, and can make it easier for you to port a commercial database to PostgreSQL. Amazon RDS for PostgreSQL versions 9.6.6 and later support this extension. For more information about `orafce`, see the [orafce project on GitHub](#).

### Note

Amazon RDS for PostgreSQL doesn't support the `utl_file` package that is part of the `orafce` extension. This is because the `utl_file` schema functions provide read and write operations on operating-system text files, which requires superuser access to the underlying host.

## To use the `orafce` extension

1. Connect to the DB instance with the master user name that you used to create the DB instance.

**Note**

If you want to enable `orafce` on a different database in the same instance, use the `/c dbname psql` command to change from the primary database after initiating the connection.

2. Enable the `orafce` extension with the `CREATE EXTENSION` statement.

```
CREATE EXTENSION orafce;
```

3. Transfer ownership of the oracle schema to the `rds_superuser` role with the `ALTER SCHEMA` statement.

```
ALTER SCHEMA oracle OWNER TO rds_superuser;
```

**Note**

If you want to see the list of owners for the oracle schema, use the `\dn` psql command.

## Accessing external data with the `postgres_fdw` extension

You can access data in a table on a remote database server with the `postgres_fdw` extension. If you set up a remote connection from your PostgreSQL DB instance, access is also available to your read replica.

### To use `postgres_fdw` to access a remote database server

1. Install the `postgres_fdw` extension.

```
CREATE EXTENSION postgres_fdw;
```

2. Create a foreign data server using `CREATE SERVER`.

```
CREATE SERVER foreign_server
FOREIGN DATA WRAPPER postgres_fdw
OPTIONS (host 'xxx.xx.xxx.xx', port '5432', dbname 'foreign_db');
```

3. Create a user mapping to identify the role to be used on the remote server.

```
CREATE USER MAPPING FOR local_user
SERVER foreign_server
OPTIONS (user 'foreign_user', password 'password');
```

4. Create a table that maps to the table on the remote server.

```
CREATE FOREIGN TABLE foreign_table (
 id integer NOT NULL,
 data text)
```

```
 SERVER foreign_server
OPTIONS (schema_name 'some_schema', table_name 'some_table');
```

## Restricting password management

You can restrict who can manage database user passwords to a special role. By doing this, you can have more control over password management on the client side.

You enable restricted password management with the static parameter `rds.restrict_password_commands` and use a role called `rds_password`. When the parameter `rds.restrict_password_commands` is set to 1, only users that are members of the `rds_password` role can run certain SQL commands. The restricted SQL commands are commands that modify database user passwords and password expiration time.

To use restricted password management, your DB instance must be running Amazon RDS for PostgreSQL 10.6 or higher. Because the `rds.restrict_password_commands` parameter is static, changing this parameter requires a database restart.

When a database has restricted password management enabled, if you try to run restricted SQL commands you get the following error: `ERROR: must be a member of rds_password to alter passwords.`

Following are some examples of SQL commands that are restricted when restricted password management is enabled.

```
postgres=> CREATE ROLE myrole WITH PASSWORD 'mypassword';
postgres=> CREATE ROLE myrole WITH PASSWORD 'mypassword' VALID UNTIL '2020-01-01';
postgres=> ALTER ROLE myrole WITH PASSWORD 'mypassword' VALID UNTIL '2020-01-01';
postgres=> ALTER ROLE myrole WITH PASSWORD 'mypassword';
postgres=> ALTER ROLE myrole VALID UNTIL '2020-01-01';
postgres=> ALTER ROLE myrole RENAME TO myrole2;
```

Some `ALTER ROLE` commands that include `RENAME TO` might also be restricted. They might be restricted because renaming a PostgreSQL role that has an MD5 password clears the password.

The `rds_superuser` role has membership for the `rds_password` role by default, and you can't change this. You can give other roles membership for the `rds_password` role by using the `GRANT` SQL command. We recommend that you give membership to `rds_password` to only a few roles that you use solely for password management. These roles require the `CREATEROLE` attribute to modify other roles.

Make sure that you verify password requirements such as expiration and needed complexity on the client side. We recommend that you restrict password-related changes by using your own client-side utility. This utility should have a role that is a member of `rds_password` and has the `CREATEROLE` role attribute.

## Working with PostgreSQL autovacuum on Amazon RDS

We strongly recommend that you use the autovacuum feature for PostgreSQL databases to maintain the health of your PostgreSQL DB instance. Autovacuum automates the start of the `VACUUM` and the `ANALYZE` commands. Autovacuum checks for tables that have had a large number of inserted, updated, or deleted tuples. Autovacuum then reclaims storage by removing obsolete data or tuples from the PostgreSQL database.

Autovacuum is enabled by default for all new Amazon RDS for PostgreSQL DB instances, and the related autovacuum configuration parameters are appropriately set by default. Because our defaults

are somewhat generic, you can benefit from tuning parameters to your specific workload. The following section can help you perform the needed autovacuum tuning.

#### Topics

- [Allocating memory for autovacuum \(p. 1632\)](#)
- [Reducing the likelihood of transaction ID wraparound \(p. 1632\)](#)
- [Determining if the tables in your database need vacuuming \(p. 1633\)](#)
- [Determining which tables are currently eligible for autovacuum \(p. 1634\)](#)
- [Determining if autovacuum is currently running and for how long \(p. 1635\)](#)
- [Performing a manual vacuum freeze \(p. 1636\)](#)
- [Reindexing a table when autovacuum is running \(p. 1638\)](#)
- [Other parameters that affect autovacuum \(p. 1638\)](#)
- [Setting table-level autovacuum parameters \(p. 1639\)](#)
- [Autovacuum logging \(p. 1639\)](#)

## Allocating memory for autovacuum

One of the most important parameters influencing autovacuum performance is the `maintenance_work_mem` parameter. This parameter determines how much memory that you allocate for autovacuum to use to scan a database table and to hold all the row IDs that are going to be vacuumed. If you set the value of the `maintenance_work_mem` parameter too low, the vacuum process might have to scan the table multiple times to complete its work. Such multiple scans can have a negative impact on performance.

When doing calculations to determine the `maintenance_work_mem` parameter value, keep in mind two things:

- The default unit is kilobytes (KB) for this parameter.
- The `maintenance_work_mem` parameter works in conjunction with the `autovacuum_max_workers` parameter. If you have many small tables, allocate more `autovacuum_max_workers` and less `maintenance_work_mem`. If you have large tables (say, larger than 100 GB), allocate more memory and fewer worker processes. You need to have enough memory allocated to succeed on your biggest table. Each `autovacuum_max_workers` can use the memory you allocate. Thus, you should make sure the combination of worker processes and memory equal the total memory that you want to allocate.

In general terms, for large hosts set the `maintenance_work_mem` parameter to a value between one and two gigabytes (between 1,048,576 and 2,097,152 KB). For extremely large hosts, set the parameter to a value between two and four gigabytes (between 2,097,152 and 4,194,304 KB). The value you set for this parameter should depend on the workload. Amazon RDS has updated its default for this parameter to be kilobytes calculated as follows:

```
GREATEST({DBInstanceClassMemory/63963136*1024}, 65536).
```

## Reducing the likelihood of transaction ID wraparound

In some cases, parameter group settings related to autovacuum might not be aggressive enough to prevent transaction ID wraparound. To address this, Amazon RDS for PostgreSQL provides a mechanism that adapts the autovacuum parameter values automatically. *Adaptive autovacuum parameter tuning* is a feature for RDS for PostgreSQL. A detailed explanation of `TransactionID wraparound` is found in the PostgreSQL documentation.

Adaptive autovacuum parameter tuning is enabled by default for RDS for PostgreSQL instances with the dynamic parameter `rds.adaptive_autovacuum` set to ON. We strongly recommend

that you keep this enabled. However, to turn off adaptive autovacuum parameter tuning, set the `rds.adaptive_autovacuum` parameter to 0 or OFF.

Transaction ID wraparound is still possible even when RDS tunes the autovacuum parameters. We encourage you to implement an Amazon CloudWatch alarm for transaction ID wraparound. For more information, see the blog post [Implement an early warning system for transaction ID wraparound in Amazon RDS for PostgreSQL](#).

With adaptive autovacuum parameter tuning enabled, RDS will begin adjusting autovacuum parameters when the CloudWatch metric `MaximumUsedTransactionIDs` reaches the value of the `autovacuum_freeze_max_age` parameter or 500,000,000, whichever is greater.

RDS continues to adjust parameters for autovacuum if a table continues to trend toward transaction ID wraparound. Each of these adjustments dedicates more resources to autovacuum to avoid wraparound. RDS updates the following autovacuum-related parameters:

- `autovacuum_vacuum_cost_delay`
- `autovacuum_vacuum_cost_limit`
- `autovacuum_work_mem`
- `autovacuum_naptime`

RDS modifies these parameters only if the new value makes autovacuum more aggressive. The parameters are modified in memory on the DB instance. The values in the parameter group aren't changed. To view the current in-memory settings, use the PostgreSQL `SHOW` SQL command.

Whenever RDS modifies any of these autovacuum parameters, it generates an event for the affected DB instance that is visible on the AWS Management Console (<https://console.aws.amazon.com/rds/>) and through the RDS API. After the `MaximumUsedTransactionIDs` CloudWatch metric returns below the threshold, RDS resets the autovacuum related parameters in memory back to the values specified in the parameter group and generates another event corresponding to this change.

## Determining if the tables in your database need vacuuming

You can use the following query to show the number of unvacuumed transactions in a database. The `datfrozenxid` column of a database's `pg_database` row is a lower bound on the normal transaction IDs appearing in that database. This column is the minimum of the per-table `realfrozenxid` values within the database.

```
SELECT datname, age(datfrozenxid) FROM pg_database ORDER BY age(datfrozenxid) desc limit 20;
```

For example, the results of running the preceding query might be the following.

datname	age
mydb	1771757888
template0	1721757888
template1	1721757888
rdsadmin	1694008527
postgres	1693881061
(5 rows)	

When the age of a database reaches 2 billion transaction IDs, transaction ID (XID) wraparound occurs and the database becomes read-only. This query can be used to produce a metric and run a few times a day. By default, autovacuum is set to keep the age of transactions to no more than 200,000,000 (`autovacuum_freeze_max_age`).

A sample monitoring strategy might look like this:

- Set the `autovacuum_freeze_max_age` value to 200 million transactions.
- If a table reaches 500 million unvacuumed transactions, that triggers a low-severity alarm. This isn't an unreasonable value, but it can indicate that autovacuum isn't keeping up.
- If a table ages to 1 billion, this should be treated as an alarm to take action on. In general, you want to keep ages closer to `autovacuum_freeze_max_age` for performance reasons. We recommend you investigate using the recommendations that follow.
- If a table reaches 1.5 billion unvacuumed transactions, that triggers a high-severity alarm. Depending on how quickly your database uses transaction IDs, this alarm can indicate that the system is running out of time to run autovacuum. In this case, we recommend you resolve this immediately.

If a table is constantly breaching these thresholds, you need to modify your autovacuum parameters further. By default, using `VACUUM` manually (which has cost-based delays disabled) is more aggressive than using the default autovacuum, but it is also more intrusive to the system as a whole.

We recommend the following:

- Be aware and enable a monitoring mechanism so that you are aware of the age of your oldest transactions.

For information on creating a process that warns you about transaction ID wraparound, see the AWS Database Blog post [Implement an early warning system for transaction ID wraparound in Amazon RDS for PostgreSQL](#).

- For busier tables, perform a manual vacuum freeze regularly during a maintenance window, in addition to relying on autovacuum. For information on performing a manual vacuum freeze, see [Performing a manual vacuum freeze \(p. 1636\)](#).

## Determining which tables are currently eligible for autovacuum

Often, it is one or two tables in need of vacuuming. Tables whose `realfrozenxid` value is greater than the number of transactions in `autovacuum_freeze_max_age` are always targeted by autovacuum. Otherwise, if the number of tuples made obsolete since the last `VACUUM` exceeds the "vacuum threshold", the table is vacuumed.

The `autovacuum threshold` is defined as:

```
Vacuum-threshold = vacuum-base-threshold + vacuum-scale-factor * number-of-tuples
```

While you are connected to your database, run the following query to see a list of tables that autovacuum sees as eligible for vacuuming:

```
WITH vbt AS (SELECT setting AS autovacuum_vacuum_threshold
 FROM pg_settings
 WHERE name = 'autovacuum_vacuum_threshold')
 , vsf AS (SELECT setting AS autovacuum_vacuum_scale_factor
 FROM pg_settings
 WHERE name = 'autovacuum_vacuum_scale_factor')
 , fma AS (SELECT setting AS autovacuum_freeze_max_age
 FROM pg_settings
 WHERE name = 'autovacuum_freeze_max_age')
 , sto AS (select opt_oid, split_part(setting, '=', 1) as param,
 split_part(setting, '=', 2) as value
 from (select oid opt_oid,
 unnest(reloptions) setting
 from pg_class) opt)
SELECT
 '''||ns.nspname||'.'||c.relname||''' as relation

```

## Determining if autovacuum is currently running and for how long

If you need to manually vacuum a table, you need to determine if autovacuum is currently running. If it is, you might need to adjust parameters to make it run more efficiently, or terminate autovacuum so you can manually run VACUUM.

Use the following query to determine if autovacuum is running, how long it has been running, and if it is waiting on another session.

If you are using RDS for PostgreSQL 9.6+ or higher, use this query:

```

SELECT datname, usename, pid, state, wait_event, current_timestamp - xact_start AS
xact_runtime, query
FROM pg_stat_activity
WHERE upper(query) LIKE '%VACUUM%'
ORDER BY xact_start;

```

After running the query, you should see output similar to the following.

datname	usename	pid	state	wait_event	xact_runtime	query
mydb	rdsadmin	16473	active		33 days 16:32:11.600656	autovacuum: VACUUM ANALYZE public.mytable1 (to prevent wraparound)
mydb	rdsadmin	22553	active		14 days 09:15:34.073141	autovacuum: VACUUM ANALYZE public.mytable2 (to prevent wraparound)
mydb	rdsadmin	41909	active		3 days 02:43:54.203349	autovacuum: VACUUM ANALYZE public.mytable3
mydb	rdsadmin	618	active		00:00:00	SELECT datname, usename, pid, state, wait_event, current_timestamp - xact_start AS xact_runtime, query+   FROM pg_stat_activity +

```

| | | | | | WHERE query
like '%VACUUM%' +
| | | | | | ORDER BY
xact_start; +

```

If you are using an Amazon RDS for PostgreSQL version less than 9.6, use the following query.

```

SELECT datname, usename, pid, waiting, current_timestamp - xact_start AS xact_runtime,
 query
FROM pg_stat_activity
WHERE upper(query) LIKE '%VACUUM%'
ORDER BY xact_start;

```

After running the query, you should see output similar to the following.

datname	username	pid	waiting	xact_runtime	query
mydb	rdsadmin	16473	f	33 days 16:32:11.600656	autovacuum: VACUUM
					ANALYZE public.mytable1 (to prevent wraparound)
mydb	rdsadmin	22553	f	14 days 09:15:34.073141	autovacuum: VACUUM
					ANALYZE public.mytable2 (to prevent wraparound)
mydb	rdsadmin	41909	f	3 days 02:43:54.203349	autovacuum: VACUUM
					ANALYZE public.mytable3
mydb	rdsadmin	618	f	00:00:00	SELECT datname, usename,
					pid, waiting, current_timestamp - xact_start AS xact_runtime, query+
					FROM pg_stat_activity
					+
					WHERE query like '%VACUUM'
					+
%'					ORDER BY xact_start;
					+

Several issues can cause a long-running autovacuum session (that is, multiple days long). The most common issue is that your [maintenance\\_work\\_mem](#) parameter value is set too low for the size of the table or rate of updates.

We recommend that you use the following formula to set the [maintenance\\_work\\_mem](#) parameter value.

```
GREATEST({DBInstanceClassMemory/63963136*1024},65536)
```

Short running autovacuum sessions can also indicate problems:

- It can indicate that there aren't enough [autovacuum\\_max\\_workers](#) for your workload. In this case, you need to indicate the number of workers.
- It can indicate that there is an index corruption (autovacuum crashes and restart on the same relation but make no progress). In this case, run a manual vacuum freeze verbose [\\_\\_table\\_\\_](#) to see the exact cause.

## Performing a manual vacuum freeze

You might want to perform a manual vacuum on a table that has a vacuum process already running. This is useful if you have identified a table with an age approaching 2 billion transactions (or above any threshold you are monitoring).

The following steps are a guideline, and there are several variations to the process. For example, during testing, suppose that you find that the `maintenance_work_mem` parameter value was set too small and that you need to take immediate action on a table. However, perhaps you don't want to bounce the instance at the moment. Using the queries in previous sections, you determine which table is the problem and notice a long running autovacuum session. You know that you need to change the `maintenance_work_mem` parameter setting, but you also need to take immediate action and vacuum the table in question. The following procedure shows what to do in this situation:

### To manually perform a vacuum freeze

1. Open two sessions to the database containing the table you want to vacuum. For the second session, use "screen" or another utility that maintains the session if your connection is dropped.
2. In session one, get the PID of the autovacuum session running on the table.

Run the following query to get the PID of the autovacuum session.

```
SELECT datname, username, pid, current_timestamp - xact_start
AS xact_runtime, query
FROM pg_stat_activity WHERE upper(query) LIKE '%VACUUM%' ORDER BY
xact_start;
```

3. In session two, calculate the amount of memory you need for this operation. In this example, we determine that we can afford to use up to 2 GB of memory for this operation, so we set `maintenance_work_mem` for the current session to 2 GB.

```
set maintenance_work_mem='2 GB';
SET
```

4. In session two, issue a `vacuum freeze verbose` command for the table. The verbose setting is useful because, although there is no progress report for this in PostgreSQL currently, you can see activity.

```
\timing on
Timing is on.
vacuum freeze verbose pgbench_branches;
```

```
INFO: vacuuming "public.pgbench_branches"
INFO: index "pgbench_branches_pkey" now contains 50 row versions in 2 pages
DETAIL: 0 index row versions were removed.
0 index pages have been deleted, 0 are currently reusable.
CPU 0.00s/0.00u sec elapsed 0.00 sec.
INFO: index "pgbench_branches_test_index" now contains 50 row versions in 2 pages
DETAIL: 0 index row versions were removed.
0 index pages have been deleted, 0 are currently reusable.
CPU 0.00s/0.00u sec elapsed 0.00 sec.
INFO: "pgbench_branches": found 0 removable, 50 nonremovable row versions
 in 43 out of 43 pages
DETAIL: 0 dead row versions cannot be removed yet.
There were 9347 unused item pointers.
0 pages are entirely empty.
CPU 0.00s/0.00u sec elapsed 0.00 sec.
VACUUM
Time: 2.765 ms
```

5. In session one, if autovacuum was blocking, you see in `pg_stat_activity` that waiting is "T" for your vacuum session. In this case, you need to terminate the autovacuum process as follows.

```
SELECT pg_terminate_backend('the_pid');
```

6. At this point, your session begins. It's important to note that autovacuum restarts immediately because this table is probably the highest on its list of work. Initiate your `vacuum freeze verbose` command in session 2 and then terminate the autovacuum process in session 1.

## Reindexing a table when autovacuum is running

If an index has become corrupt, autovacuum continues to process the table and fails. If you attempt a manual vacuum in this situation, you will receive an error message similar to the following:

```
mydb=# vacuum freeze pgbench_branches;
ERROR: index "pgbench_branches_test_index" contains unexpected
 zero page at block 30521
HINT: Please REINDEX it.
```

When the index is corrupted and autovacuum is attempting to run against the table, you contend with an already running autovacuum session. When you issue a `"REINDEX"` command, you take out an exclusive lock on the table. Write operations are blocked, and also reads that use that specific index.

### To reindex a table when autovacuum is running on the table

1. Open two sessions to the database containing the table you want to vacuum. For the second session, use "screen" or another utility that maintains the session if your connection is dropped.
2. In session one, get the PID of the autovacuum session running on the table.

Run the following query to get the PID of the autovacuum session.

```
SELECT datname, usename, pid, current_timestamp - xact_start
AS xact_runtime, query
FROM pg_stat_activity WHERE upper(query) like '%VACUUM%' ORDER BY
xact_start;
```

3. In session two, issue the reindex command.

```
\timing on
Timing is on.
reindex index pgbench_branches_test_index;
REINDEX
Time: 9.966 ms
```

4. In session one, if autovacuum was blocking, you see in `pg_stat_activity` that waiting is "T" for your vacuum session. In this case, you will need to terminate the autovacuum process.

```
select pg_terminate_backend('the_pid');
```

5. At this point, your session begins. It's important to note that autovacuum restarts immediately because this table is probably the highest on its list of work. Initiate your command in session 2 and then terminate the autovacuum process in session 1.

## Other parameters that affect autovacuum

The following query shows the values of some of the parameters that directly affect autovacuum and its behavior. The [autovacuum parameters](#) are described fully in the PostgreSQL documentation.

```
SELECT name, setting, unit, short_desc
FROM pg_settings
```

```
WHERE name IN (
 'autovacuum_max_workers',
 'autovacuum_analyze_scale_factor',
 'autovacuum_naptime',
 'autovacuum_analyze_threshold',
 'autovacuum_analyze_scale_factor',
 'autovacuum_vacuum_threshold',
 'autovacuum_vacuum_scale_factor',
 'autovacuum_vacuum_threshold',
 'autovacuum_vacuum_cost_delay',
 'autovacuum_vacuum_cost_limit',
 'vacuum_cost_limit',
 'autovacuum_freeze_max_age',
 'maintenance_work_mem',
 'vacuum_freeze_min_age');
```

While these all affect autovacuum, some of the most important ones are:

- [maintenance\\_work\\_mem](#)
- [autovacuum\\_freeze\\_max\\_age](#)
- [autovacuum\\_max\\_workers](#)
- [autovacuum\\_vacuum\\_cost\\_delay](#)
- [Autovacuum\\_vacuum\\_cost\\_limit](#)

## Setting table-level autovacuum parameters

Autovacuum-related [storage parameters](#) can be set at a table level, which can be better than altering the behavior of the entire database. For large tables, you might need to set aggressive settings and you might not want to make autovacuum behave that way for all tables.

The following query shows which tables currently have table-level options in place.

```
SELECT relname, reloptions
FROM pg_class
WHERE reloptions IS NOT null;
```

An example where this might be useful is on tables that are much larger than the rest of your tables. Suppose that you have one 300-GB table and 30 other tables less than 1 GB. In this case, you might set some specific parameters for your large table so you don't alter the behavior of your entire system.

```
ALTER TABLE mytable set (autovacuum_vacuum_cost_delay=0);
```

Doing this disables the cost-based autovacuum delay for this table at the expense of more resource usage on your system. Normally, autovacuum pauses for autovacuum\_vacuum\_cost\_delay each time autovacuum\_cost\_limit is reached. You can find more details in the PostgreSQL documentation about [cost-based vacuuming](#).

## Autovacuum logging

By default, the *postgresql.log* doesn't contain information about the autovacuum process. You can see output in the PostgreSQL error log from the autovacuum worker operations by setting the `rds.force_autovacuum_logging_level` parameter. Allowed values are `disabled`, `debug5`, `debug4`, `debug3`, `debug2`, `debug1`, `info`, `notice`, `warning`, `error`, `log`, `fatal`, and `panic`. The default value is `disabled` because the other allowable values can add significant amount of information to your logs.

We recommend that you set the value of the `rds.force_autovacuum_logging_level` parameter to `warning` and that you set the `log_autovacuum_min_duration` parameter to a value from 1,000 to 5,000 milliseconds. If you set this value to 5,000, Amazon RDS writes any activity to the log that takes more than five seconds. It also shows "vacuum skipped" messages when application locking is causing autovacuum to intentionally skip tables. If you are troubleshooting a problem and need more detail, you can use a different logging level value, such as `debug1` or `debug3`. Use these debug parameters for a short period of time because these settings produce extremely verbose content written to the error log file. For more information about these debug settings, see the [PostgreSQL documentation](#).

**Note**

PostgreSQL allows the `rds_superuser` account to view autovacuum sessions in `pg_stat_activity`. For example, you can identify and end an autovacuum session that is blocking a command from running, or running slower than a manually issued `vacuum` command.

## Working with the PostGIS extension

PostGIS is an extension to PostgreSQL for storing and managing spatial information. If you are not familiar with PostGIS, see [PostGIS.net](#).

You need to perform some setup before you can use the PostGIS extension. The following list shows what you need to do. Each step is described in greater detail later in this section.

**Topics**

- [Step 1: Connect to the DB instance using the user name used to create the DB instance \(p. 1640\)](#)
- [Step 2: Load the PostGIS extensions \(p. 1640\)](#)
- [Step 3: Transfer ownership of the extensions to the `rds\_superuser` role \(p. 1641\)](#)
- [Step 4: Transfer ownership of the objects to the `rds\_superuser` role \(p. 1641\)](#)
- [Step 5: Test the extensions \(p. 1641\)](#)
- [PostGIS extension versions \(p. 1642\)](#)

### Step 1: Connect to the DB instance using the user name used to create the DB instance

First, you connect to the DB instance using the user name that was used to create the DB instance. That name is automatically assigned the `rds_superuser` role. You need the `rds_superuser` role that is needed to do the remaining steps.

The following example uses `SELECT` to show you the current user. In this case, the current user should be the user name you chose when creating the DB instance.

```
SELECT CURRENT_USER;
current_user

myawsuser
(1 row)
```

### Step 2: Load the PostGIS extensions

Use `CREATE EXTENSION` statements to load the PostGIS extensions. You must also load the `extension` extension. You can then use the `\dn` command to list the owners of the PostGIS schemas.

```
CREATE EXTENSION postgis;
CREATE EXTENSION fuzzystrmatch;
CREATE EXTENSION postgis_tiger_geocoder;
```

```
CREATE EXTENSION postgis_topology;
\dn
 List of schemas
 Name | Owner

 public | myawsuser
 tiger | rdsadmin
 tiger_data | rdsadmin
 topology | rdsadmin
(4 rows)
```

## Step 3: Transfer ownership of the extensions to the rds\_superuser role

Use the ALTER SCHEMA statements to transfer ownership of the schemas to the `rds_superuser` role.

```
ALTER SCHEMA tiger OWNER TO rds_superuser;
ALTER SCHEMA tiger_data OWNER TO rds_superuser;
ALTER SCHEMA topology OWNER TO rds_superuser;
\dn
 List of schemas
 Name | Owner

 public | myawsuser
 tiger | rds_superuser
 tiger_data | rds_superuser
 topology | rds_superuser
(4 rows)
```

## Step 4: Transfer ownership of the objects to the rds\_superuser role

Use the following function to transfer ownership of the PostGIS objects to the `rds_superuser` role. Run the following statement from the `psql` prompt to create the function.

```
CREATE FUNCTION exec(text) returns text language plpgsql volatile AS $$ BEGIN EXECUTE $1;
 RETURN $1; END; $$;
```

Next, run this query to run the `exec` function that in turn runs the statements and alters the permissions.

```
SELECT exec('ALTER TABLE ' || quote_ident(s.nspname) || '.' || quote_ident(s.relname) || ' '
 OWNER TO rds_superuser;')
 FROM (
 SELECT nspname, relname
 FROM pg_class c JOIN pg_namespace n ON (c.relnamespace = n.oid)
 WHERE nspname in ('tiger','topology') AND
 relkind IN ('r','S','v') ORDER BY relkind = 'S')
s;
```

## Step 5: Test the extensions

Add `tiger` to your search path using the following command.

```
SET search_path=public,tiger;
```

Test `tiger` by using the following `SELECT` statement.

```
SELECT na.address, na.streetname, na.streettypeabbrev, na.zip
FROM normalize_address('1 Devonshire Place, Boston, MA 02109') AS na;
address | streetname | streettypeabbrev | zip
-----+-----+-----+
1 | Devonshire | Pl | 02109
(1 row)
```

Test topology by using the following SELECT statement.

```
SELECT topology.createtopology('my_new_topo',26986,0.5);
createtopology

1
(1 row)
```

## PostGIS extension versions

The following table shows the PostGIS versions that ship with the RDS for PostgreSQL versions.

PostgreSQL version	PostGIS version
13.2, 13.1	3.0.2
12.6	3.0.2
12.5, 12.4, 12.3, 12.2	3.0.0
11.11, 11.10, 11.9, 11.8, 11.7, 11.6, 11.5	2.5.2
11.4, 11.2, 11.1	2.5.1
10.16, 10.15, 10.14, 10.13, 10.12, 10.11, 10.10	2.5.2
10.9, 10.7, 10.6, 10.5, 10.4	2.4.4
10.3, 10.1	2.4.2
9.6.21, 9.6.20, 9.6.19, 9.6.18, 9.6.17, 9.6.16, 9.6.15	2.5.2
9.6.14, 9.6.12, 9.6.11, 9.6.10, 9.6.9	2.3.7
9.6.8, 9.6.6	2.3.4
9.6.5, 9.6.3, 9.6.2	2.3.2
9.6.1	2.3.0
9.5.25, 9.5.24, 9.5.23, 9.5.22, 9.5.21, 9.5.20, 9.5.19	2.5.2
9.5.18, 9.5.16, 9.5.15, 9.5.14, 9.5.13, 9.5.12, 9.5.10, 9.5.9, 9.5.7, 9.5.6	2.2.5
9.5.4, 9.5.2	2.2.2

### Note

PostgreSQL 10.5 added support for the libprotobuf extension version 1.3.0 to the PostGIS component.

# Using a custom DNS server for outbound network access

Amazon RDS for PostgreSQL supports outbound network access on your DB instances and allows Domain Name Service (DNS) resolution from a custom DNS server owned by the customer. You can resolve only fully qualified domain names from your Amazon RDS DB instance through your custom DNS server.

## Topics

- [Enabling custom DNS resolution \(p. 1643\)](#)
- [Disabling custom DNS resolution \(p. 1643\)](#)
- [Setting up a custom DNS server \(p. 1643\)](#)

## Enabling custom DNS resolution

To enable DNS resolution in your customer VPC, associate a custom DB parameter group to your RDS for PostgreSQL instance, turn on the `rds.custom_dns_resolution` parameter by setting it to 1, and then restart the DB instance for the changes to take place.

## Disabling custom DNS resolution

To disable DNS resolution in your customer VPC, turn off the `rds.custom_dns_resolution` parameter of your custom DB parameter group by setting it to 0, then restart the DB instance for the changes to take place.

## Setting up a custom DNS server

After you set up your custom DNS name server, it takes up to 30 minutes to propagate the changes to your DB instance. After the changes are propagated to your DB instance, all outbound network traffic requiring a DNS lookup queries your DNS server over port 53.

### Note

If you don't set up a custom DNS server, and `rds.custom_dns_resolution` is set to 1, hosts are resolved using a Route 53 private zone. For more information, see [Working with private hosted zones](#).

### To set up a custom DNS server for your Amazon RDS for PostgreSQL DB instance

1. From the DHCP options set attached to your VPC, set the `domain-name-servers` option to the IP address of your DNS name server. For more information, see [DHCP options sets](#).

### Note

The `domain-name-servers` option accepts up to four values, but your Amazon RDS DB instance uses only the first value.

2. Ensure that your DNS server can resolve all lookup queries, including public DNS names, Amazon EC2 private DNS names, and customer-specific DNS names. If the outbound network traffic contains any DNS lookups that your DNS server can't handle, your DNS server must have appropriate upstream DNS providers configured.
3. Configure your DNS server to produce User Datagram Protocol (UDP) responses of 512 bytes or less.
4. Configure your DNS server to produce Transmission Control Protocol (TCP) responses of 1024 bytes or less.
5. Configure your DNS server to allow inbound traffic from your Amazon RDS DB instances over port 53. If your DNS server is in an Amazon VPC, the VPC must have a security group that contains

inbound rules that allow UDP and TCP traffic on port 53. If your DNS server is not in an Amazon VPC, it must have appropriate firewall settings to allow UDP and TCP inbound traffic on port 53.

For more information, see [Security groups for your VPC](#) and [Adding and removing rules](#).

6. Configure the VPC of your Amazon RDS DB instance to allow outbound traffic over port 53. Your VPC must have a security group that contains outbound rules that allow UDP and TCP traffic on port 53.

For more information, see [Security groups for your VPC](#) and [Adding and removing rules](#).

7. The routing path between the Amazon RDS DB instance and the DNS server has to be configured correctly to allow DNS traffic.

If the Amazon RDS DB instance and the DNS server are not in the same VPC, a peering connection has to be set up between them. For more information, see [What is VPC peering?](#)

# Scheduling maintenance with the PostgreSQL pg\_cron extension

You can use the PostgreSQL pg\_cron extension to schedule maintenance commands within a PostgreSQL database. For a complete description, see [What is pg\\_cron?](#) in the pg\_cron documentation.

The pg\_cron extension is supported on Amazon RDS for PostgreSQL engine versions 12.5 and higher.

## Topics

- [Enabling the pg\\_cron extension \(p. 1645\)](#)
- [Granting permissions to pg\\_cron \(p. 1645\)](#)
- [Cron job to manually vacuum a table \(p. 1646\)](#)
- [Cron job to purge the pg\\_cron history \(p. 1647\)](#)
- [Disabling logging of pg\\_cron history \(p. 1647\)](#)
- [Scheduling a cron job for a database other than postgres \(p. 1647\)](#)
- [The pg\\_cron reference \(p. 1648\)](#)

## Enabling the pg\_cron extension

Enable the pg\_cron extension as follows:

1. Modify the parameter group associated with your DB instance and add pg\_cron to the `shared_preload_libraries` parameter value. This change requires a DB instance restart to take effect. For more information, see [Modifying parameters in a DB parameter group \(p. 233\)](#).
2. After the DB instance has restarted, run the following command using an account that has the `rds_superuser` permissions.

```
CREATE EXTENSION pg_cron;
```

3. Either use the default settings, or schedule jobs to run in other databases within your PostgreSQL DB instance. The pg\_cron scheduler is set in the default PostgreSQL database named `postgres`. The pg\_cron objects are created in this `postgres` database and all scheduling actions run in this database.

To schedule jobs to run in other databases within your PostgreSQL DB instance, see the example in [Scheduling a cron job for a database other than postgres \(p. 1647\)](#).

## Granting permissions to pg\_cron

As the `rds_superuser` role, you can create the pg\_cron extension and then grant permissions to other users. For other users to be able to schedule jobs, grant them permissions to objects in the cron schema.

### Important

We recommend that you grant permissions to the cron schema sparingly.

To grant others permission to the cron schema, run the following command.

```
postgres=> GRANT USAGE ON SCHEMA cron TO other-user;
```

This permission provides `other-user` with access to the cron schema to schedule and unschedule cron jobs. However, for the cron jobs to run successfully, the user also needs permission to access the objects in the cron jobs. If the user doesn't have permission, the job fails and errors such as the

following appears in the `postgresql.log`. In this example, the user doesn't have permission to access the `pgbench_accounts` table.

```
2020-12-08 16:41:00 UTC::@[30647]:ERROR: permission denied for table pgbench_accounts
2020-12-08 16:41:00 UTC::@[30647]:STATEMENT: update pgbench_accounts set abalance =
abalance + 1
2020-12-08 16:41:00 UTC::@[27071]:LOG: background worker "pg_cron" (PID 30647) exited with
exit code 1
```

Other messages in the `cron.job_run_details` table appear like the following.

```
postgres=> select jobid, username, status, return_message, start_time from
cron.job_run_details where status = 'failed';
 jobid | username | status | return_message | start_time
-----+-----+-----+-----+-----+
 143 | unprivuser | failed | ERROR: permission denied for table pgbench_accounts | 2020-12-08 16:41:00.036268+00
 143 | unprivuser | failed | ERROR: permission denied for table pgbench_accounts | 2020-12-08 16:40:00.050844+00
 143 | unprivuser | failed | ERROR: permission denied for table pgbench_accounts | 2020-12-08 16:42:00.175644+00
 143 | unprivuser | failed | ERROR: permission denied for table pgbench_accounts | 2020-12-08 16:43:00.069174+00
 143 | unprivuser | failed | ERROR: permission denied for table pgbench_accounts | 2020-12-08 16:44:00.059466+00
(5 rows)
```

For more information, see [The pg\\_cron tables \(p. 1650\)](#).

## Cron job to manually vacuum a table

Autovacuum handles vacuum maintenance for most cases. For more information, see [Working with PostgreSQL autovacuum on Amazon RDS \(p. 1631\)](#).

However, you might want to manually vacuum a specific table at a time of your choosing. Following is an example of using the `cron.schedule` function to set up a job to use `VACUUM FREEZE` on a specific table every day at 22:00 (GMT).

```
SELECT cron.schedule('manual vacuum', '0 22 * * *', 'VACUUM FREEZE pgbench_accounts');
schedule

1
(1 row)
```

After the preceding example runs, you can check the history in the `cron.job_run_details` table as follows.

```
postgres=> select * from cron.job_run_details;
 jobid | runid | job_pid | database | username | command | status | return_message | start_time | end_time
-----+-----+-----+-----+-----+-----+-----+-----+-----+
 1 | 1 | 3395 | postgres | adminuser | vacuum freeze pgbench_accounts | succeeded | VACUUM | 2020-12-04 21:10:00.050386+00 | 2020-12-04 21:10:00.072028+00
(1 row)
```

Following is an example of viewing the history in the `cron.job_run_details` table to investigate why a job failed.

```
postgres=> select * from cron.job_run_details where status = 'failed';
 jobid | runid | job_pid | database | username | command | status | return_message | start_time | end_time
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 5 | 4 | 30339 | postgres | adminuser| vacuum freeze pgbench_account | failed | ERROR: relation "pgbench_account" does not exist | 2020-12-04 21:48:00.015145+00 | 2020-12-04 21:48:00.029567+00
(1 row)
```

For more information, see [The pg\\_cron tables \(p. 1650\)](#).

## Cron job to purge the pg\_cron history

The `cron.job_run_details` table contains a history of cron jobs that can become very large over time. We recommend that you schedule a job that purges this table. For example, keeping a week's worth of entries might be sufficient for troubleshooting purposes.

The following example uses the [cron.schedule \(p. 1649\)](#) function to schedule a job that runs every day at midnight to purge the `cron.job_run_details` table. The job keeps only the last seven days. Use your `rds_superuser` account to schedule the job such as the following.

```
SELECT cron.schedule('0 0 * * *', $$DELETE
 FROM cron.job_run_details
 WHERE end_time < now() - interval '7 days'$$);
```

For more information, see [The pg\\_cron tables \(p. 1650\)](#).

## Disabling logging of pg\_cron history

To completely disable writing anything to the `cron.job_run_details` table, modify the parameter group associated with the DB instance and set the `cron.log_run` parameter to off. If you do this, the `pg_cron` extension no longer writes to the table and produces errors only in the `postgresql.log` file. For more information, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

Use the following command to check the value of the `cron.log_run` parameter.

```
postgres=> SHOW cron.log_run;
```

For more information, see [The pg\\_cron parameters \(p. 1648\)](#).

## Scheduling a cron job for a database other than postgres

The metadata for `pg_cron` is all held in the PostgreSQL default database named `postgres`. Because background workers are used for running the maintenance cron jobs, you can schedule a job in any of your databases within the RDS DB instance:

1. In the cron database, schedule the job as you normally do using the [cron.schedule \(p. 1649\)](#).

```
postgres=> SELECT cron.schedule('database1 manual vacuum', '29 03 * * *', 'vacuum freeze
 test_table');
```

2. As a user with the `rds_superuser` role, update the database column for the job that you just created so that it runs in another database within your RDS DB instance.

```
postgres=> UPDATE cron.job SET database = 'database1' WHERE jobid = 106;
```

3. Verify by querying the `cron.job` table.

```
postgres=> select * from cron.job;
 jobid | schedule | command | nodename | nodeport | database | username | active | jobname
-----+-----+-----+-----+-----+-----+-----+-----+
 106 | 29 03 * * * | vacuum freeze test_table | localhost | 8192 | database1 | adminuser | t | database1 manual vacuum
 1 | 59 23 * * * | vacuum freeze pgbench_accounts | localhost | 8192 | postgres | adminuser | t | manual vacuum
(2 rows)
```

#### Note

In some situations, you might add a cron job that you intend to run on a different database. In such cases, the job might try to run in the default database (`postgres`) before you update the correct database column. If the user name has permissions, the job successfully runs in the default database.

## The pg\_cron reference

You can use the following parameters, functions, and tables with the pg\_cron extension. For more information, see [What is pg\\_cron?](#) in the pg\_cron documentation.

### Topics

- [The pg\\_cron parameters \(p. 1648\)](#)
- [cron.schedule function \(p. 1649\)](#)
- [cron.unschedule function \(p. 1650\)](#)
- [The pg\\_cron tables \(p. 1650\)](#)

## The pg\_cron parameters

Following is the list of parameters to control the pg\_cron extension behavior.

Parameter	Description
<code>cron.database_name</code>	The database in which pg_cron metadata is kept.
<code>cron.host</code>	The hostname to connect to PostgreSQL. You can't modify this value.
<code>cron.log_run</code>	Log all the jobs that run into the <code>job_run_details</code> table. Values are <code>on</code> or <code>off</code> .  For more information, see <a href="#">The pg_cron tables (p. 1650)</a> .
<code>cron.log_statement</code>	Log all cron statements before running them. Values are <code>on</code> or <code>off</code> .

Parameter	Description
<code>cron.max_running_jobs</code>	The maximum number of jobs that can run concurrently.
<code>cron.use_background_workers</code>	Use background workers instead of client sessions. You can't modify this value.

You can use the following SQL command to display these parameters and their values.

```
postgres=> SELECT name, setting, short_desc FROM pg_settings WHERE name LIKE 'cron.%' ORDER BY name;
```

## cron.schedule function

This function schedules a cron job. The job is initially scheduled in the default `postgres` database. The function returns a bigint value representing the job identifier. To schedule jobs to run in other databases within your PostgreSQL DB instance, see the example in [Scheduling a cron job for a database other than postgres \(p. 1647\)](#).

The function has two syntax formats.

### Syntax

```
cron.schedule (job_name,
 schedule,
 command
);

cron.schedule (schedule,
 command
);
```

### Parameters

Parameter	Description
<code>job_name</code>	The name of the cron job.
<code>schedule</code>	Text indicating the schedule for the cron job. The format is the standard cron format.
<code>command</code>	Text of the command to run.

### Examples

```
postgres=> SELECT cron.schedule ('test','0 10 * * *', 'VACUUM pgbench_history');
schedule

145
(1 row)

postgres=> SELECT cron.schedule ('0 15 * * *', 'VACUUM pgbench_accounts');
schedule

146
(1 row)
```

## cron.unschedule function

This function deletes a cron job. You can either pass in the `job_name` or the `job_id`. A policy makes sure that you are the owner to remove the schedule for the job. The function returns a Boolean indicating success or failure.

The function has the following syntax formats.

### Syntax

```
cron.unschedule (job_id);
cron.unschedule (job_name);
```

### Parameters

Parameter	Description
<code>job_id</code>	A job identifier that was returned from the <code>cron.schedule</code> function when the cron job was scheduled.
<code>job_name</code>	The name of a cron job that was scheduled with the <code>cron.schedule</code> function.

### Examples

```
postgres=> select cron.unschedule(108);
unschedule

t
(1 row)

postgres=> select cron.unschedule('test');
unschedule

t
(1 row)
```

## The pg\_cron tables

The following tables are created and used to schedule the cron jobs and record how the jobs completed.

Table	Description
<code>cron.job</code>	<p>Contains the metadata about each scheduled job. Most interactions with this table should be done by using the <code>cron.schedule</code> and <code>cron.unschedule</code> functions.</p> <p><b>Note</b> We don't recommend giving update or insert privileges directly to this table. Doing so would allow the user to update the <code>username</code> column to run as <code>rds-superuser</code>.</p>

Table	Description
cron.job_run_details	<p>Contains historic information about past scheduled job executions. This is useful to investigate the status, return messages, and start and end time from the job execution.</p> <p><b>Note</b> To prevent this table from growing indefinitely, purge it on a regular basis. For an example, see <a href="#">Cron job to purge the pg_cron history (p. 1647)</a>.</p>

# Managing PostgreSQL partitions with the pg\_partman extension

PostgreSQL table partitioning provides a framework for high-performance handling of data input and reporting. Use partitioning for databases that require very fast input of large amounts of data. Partitioning also provides for faster queries of large tables. Partitioning helps maintain data without impacting the database instance because it requires less I/O resources.

By using partitioning, you can split data into custom-sized chunks for processing. For example, you can partition time-series data for ranges such as hourly, daily, weekly, monthly, quarterly, yearly, custom, or any combination of these. For a time-series data example, if you partition the table by hour, each partition contains one hour of data. If you partition the time-series table by day, the partitions holds one day's worth of data, and so on. The partition key controls the size of a partition.

When you use an `INSERT` or `UPDATE` SQL command on a partitioned table, the database engine routes the data to the appropriate partition. PostgreSQL table partitions that store the data are child tables of the main table.

During database query reads, the PostgreSQL optimizer examines the `WHERE` clause of the query and, if possible, directs the database scan to only the relevant partitions.

Starting with version 10, PostgreSQL uses declarative partitioning to implement table partitioning. This is also known as native PostgreSQL partitioning. Before PostgreSQL version 10, you used triggers to implement partitions.

PostgreSQL table partitioning provides the following features:

- Creation of new partitions at any time.
- Variable partition ranges.
- Detachable and reattachable partitions using data definition language (DDL) statements.

For example, detachable partitions are useful for removing historical data from the main partition but keeping historical data for analysis.

- New partitions inherit the parent database table properties, including the following:
  - Indexes
  - Primary keys, which must include the partition key column
  - Foreign keys
  - Check constraints
  - References
- Creating indexes for the full table or each specific partition.

You can't alter the schema for an individual partition. However, you can alter the parent table (such as adding a new column), which propagates to partitions.

## Topics

- [Overview of the PostgreSQL pg\\_partman extension \(p. 1653\)](#)
- [Enabling the pg\\_partman extension \(p. 1653\)](#)
- [Configuring partitions using the create\\_parent function \(p. 1654\)](#)
- [Configuring partition maintenance using the run\\_maintenance\\_proc function \(p. 1655\)](#)

## Overview of the PostgreSQL pg\_partman extension

You can use the PostgreSQL pg\_partman extension to automate the creation and maintenance of table partitions. For more general information, see [PG Partition Manager](#) in the pg\_partman documentation.

### Note

The pg\_partman extension is supported on RDS for PostgreSQL engine versions 12.5 and higher.

Instead of having to manually create each partition, you configure pg\_partman with the following settings:

- Table to be partitioned
- Partition type
- Partition key
- Partition granularity
- Partition precreation and management options

After you create a PostgreSQL partitioned table, you register it with pg\_partman by calling the `create_parent` function. Doing this creates the necessary partitions based on the parameters you pass to the function.

The pg\_partman extension also provides the `run_maintenance_proc` function, which you can call on a scheduled basis to automatically manage partitions. To ensure that the proper partitions are created as needed, schedule this function to run periodically (such as hourly). You can also ensure that partitions are automatically dropped.

## Enabling the pg\_partman extension

If you have multiple databases inside the same DB instance for which you want to manage partitions, enable the pg\_partman extension separately for each database. To enable the pg\_partman extension for a specific database, create the partition maintenance schema and then create the pg\_partman extension as follows.

```
CREATE SCHEMA partman;
CREATE EXTENSION pg_partman WITH SCHEMA partman;
```

### Note

To create the pg\_partman extension, make sure that you have `rds_superuser` privileges.

If you receive an error such as the following, grant the `rds_superuser` privileges to the account or use your superuser account.

```
ERROR: permission denied to create extension "pg_partman"
HINT: Must be superuser to create this extension.
```

To grant `rds_superuser` privileges, connect with your superuser account and run the following command.

```
GRANT rds_superuser TO user-or-role;
```

For the examples that show using the pg\_partman extension, we use the following sample database table and partition. This database uses a partitioned table based on a timestamp. A schema `data_mart` contains a table named `events` with a column named `created_at`. The following settings are included in the `events` table:

- Primary keys `event_id` and `created_at`, which must have the column used to guide the partition.
- A check constraint `ck_valid_operation` to enforce values for an operation table column.
- Two foreign keys, where one (`fk_orga_membership`) points to the external table `organization` and the other (`fk_parent_event_id`) is a self-referenced foreign key.
- Two indexes, where one (`idx_org_id`) is for the foreign key and the other (`idx_event_type`) is for the event type.

The following DDL statements create these objects, which are automatically included on each partition.

```

CREATE SCHEMA data_mart;
CREATE TABLE data_mart.organization (org_id BIGSERIAL,
 org_name TEXT,
 CONSTRAINT pk_organization PRIMARY KEY (org_id)
);

CREATE TABLE data_mart.events(
 event_id BIGSERIAL,
 operation CHAR(1),
 value FLOAT(24),
 parent_event_id BIGINT,
 event_type VARCHAR(25),
 org_id BIGSERIAL,
 created_at timestamp,
 CONSTRAINT pk_data_mart_event PRIMARY KEY (event_id, created_at),
 CONSTRAINT ck_valid_operation CHECK (operation = 'C' OR operation = 'D'),
 CONSTRAINT fk_orga_membership
 FOREIGN KEY(org_id)
 REFERENCES data_mart.organization (org_id),
 CONSTRAINT fk_parent_event_id
 FOREIGN KEY(parent_event_id, created_at)
 REFERENCES data_mart.events (event_id, created_at)
) PARTITION BY RANGE (created_at);

CREATE INDEX idx_org_id ON data_mart.events(org_id);
CREATE INDEX idx_event_type ON data_mart.events(event_type);

```

## Configuring partitions using the `create_parent` function

After you enable the pg\_partman extension, you use the `create_parent` function to configure partitions inside the partition maintenance schema. The following example uses the `events` table example created in [Enabling the pg\\_partman extension \(p. 1653\)](#). Call the `create_parent` function as follows.

```

SELECT partman.create_parent(p_parent_table => 'data_mart.events',
 p_control => 'created_at',
 p_type => 'native',
 p_interval=> 'daily',
 p_premake => 30);

```

The parameters are as follows:

- `p_parent_table` – The parent partitioned table. This table must already exist and be fully qualified including the schema.
- `p_control` – The column on which the partitioning is to be based. The data type must be integer or time-based.
- `p_type` – The type is either native or partman. You typically use the native type for its performance improvements and flexibility. The partman type relies on inheritance.

- `p_interval` – The time interval or integer range for each partition. Example values include daily, hourly, and so on.
- `p_premake` – The number of partitions to create in advance to support new inserts.

For a complete description of the `create_parent` function, see [Creation Functions](#) in the pg\_partman documentation.

## Configuring partition maintenance using the `run_maintenance_proc` function

You can run partition maintenance operations to automatically create new partitions, detach partitions, or remove old partitions. Partition maintenance relies on the `run_maintenance_proc` function of pg\_partman and the pg\_cron extension, which initiates an internal scheduler. The pg\_cron scheduler automatically executes SQL statements, functions, and procedures defined in your databases.

The following example uses the events table example created in [Enabling the pg\\_partman extension \(p. 1653\)](#) to set partition maintenance operations to run automatically.

```
-- Prerequisite: add pg_cron to the shared_preload_libraries parameter in the DB instance's
parameter group.

CREATE EXTENSION pg_cron;

UPDATE partman.part_config
SET infinite_time_partitions = true,
 retention = '3 months',
 retention_keep_table=true
WHERE parent_table = 'data_mart.events';
SELECT cron.schedule('@hourly', $$CALL partman.run_maintenance_proc()$$);
```

Following, you can find a step-by-step explanation of the preceding example:

1. Modify the parameter group associated with your DB instance and add pg\_cron to the `shared_preload_libraries` parameter value. This change requires a DB instance restart for it to take effect. For more information, see [Modifying parameters in a DB parameter group \(p. 233\)](#).
2. Run the command `CREATE EXTENSION pg_cron;` using an account that has the `rds_superuser` permissions. Doing this enables the pg\_cron extension. For more information, see [Scheduling maintenance with the PostgreSQL pg\\_cron extension \(p. 1645\)](#).
3. Run the command `UPDATE partman.part_config` to adjust the pg\_partman settings for the `data_mart.events` table.
4. Run the command `SET ...` to configure the `data_mart.events` table, with these clauses:
  - a. `infinite_time_partitions = true`, – Configures the table to be able to automatically create new partitions without any limit.
  - b. `retention = '3 months'`, – Configures the table to have a maximum retention of three months.
  - c. `retention_keep_table=true` – Configures the table so that when the retention period is due, the table isn't deleted automatically. Instead, partitions that are older than the retention period are only detached from the parent table.
5. Run the command `SELECT cron.schedule ...` to make a pg\_cron function call. This call defines how often the scheduler runs the pg\_partman maintenance procedure, `partman.run_maintenance_proc`. For this example, the procedure runs every hour.

For a complete description of the `run_maintenance_proc` function, see [Maintenance Functions](#) in the pg\_partman documentation.

# Invoking an AWS Lambda function from an RDS for PostgreSQL DB instance

You can invoke AWS Lambda functions from an RDS for PostgreSQL DB instance. To do this, use the `aws_lambda` PostgreSQL extension provided with RDS for PostgreSQL.

AWS Lambda is a compute service that you can use to run code. For example, you can use Lambda functions to process event notifications from a DB instance. For more information about Lambda, see [What is AWS Lambda?](#) in the *AWS Lambda Developer Guide*.

## Note

Invoking an AWS Lambda function is supported in the following RDS for PostgreSQL versions:

- 12.6 and later minor versions
- 13.2 and later minor versions

## Topics

- [Overview of using a Lambda function \(p. 1656\)](#)
- [Specifying the Lambda function to use \(p. 1657\)](#)
- [Giving RDS access to Lambda \(p. 1657\)](#)
- [Invoking Lambda functions \(p. 1659\)](#)
- [Function reference \(p. 1661\)](#)

## Overview of using a Lambda function

You can invoke a Lambda function from an RDS for PostgreSQL database with the following procedure.

### To invoke a Lambda function from an RDS for PostgreSQL database

1. Install the required PostgreSQL extensions. These include the `aws_lambda` and `aws_commons` extensions. To do so, start `psql` and run the following commands.

```
CREATE EXTENSION IF NOT EXISTS aws_lambda CASCADE;
```

The `aws_lambda` extension provides the [aws\\_lambda.invoke \(p. 1661\)](#) function that you use to invoke functions in Lambda. The `aws_commons` extension is included to provide additional helper functions.

2. Identify the name or Amazon Resource Name (ARN) for the Lambda function to use. For details about this process, see [Specifying the Lambda function to use \(p. 1657\)](#).
3. Provide permission to access the Lambda function.

To invoke a Lambda function, give the RDS for PostgreSQL DB instance permission to access the Lambda invoke API operation. Doing this includes the following steps:

1. Create an AWS Identity and Access Management (IAM) policy that provides access to a Lambda function that you want to invoke.
2. Create an IAM role.
3. Attach the IAM policy that you created to the role that you created.
4. Add this IAM role to your DB instance.

For details about this process, see [Giving RDS access to Lambda \(p. 1657\)](#).

4. Use the `aws_lambda.invoke` function to run the Lambda function. For details about this process, see [Invoking Lambda functions \(p. 1659\)](#).

## Specifying the Lambda function to use

To identify the Lambda function to use, specify the following information:

- **Function name** – The name of the Lambda function, ARN, version, or alias. For a listing of possible formats, see [Lambda function name formats](#).
- **AWS Region** – (Optional) The AWS Region where the Lambda function is located. If you don't specify a Region value and it's not specified in the function ARN, RDS uses the same Region as the DB instance.

For a listing of AWS Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

To hold the Lambda function name information, you can use the `aws_commons.create_lambda_function_arn (p. 1663)` function. This function creates an `aws_commons._lambda_function_arn_1` composite structure to store the name information, as shown following.

```
psql=> SELECT aws_commons.create_lambda_function_arn(
 'my-function',
 'us-west-2'
) AS aws_lambda_arn_1 \gset

psql=> SELECT aws_commons.create_lambda_function_arn(
 '123456789012:function:my-function',
 'us-west-2'
) AS lambda_partial_arn_1 \gset

psql=> SELECT aws_commons.create_lambda_function_arn(
 'arn:aws:lambda:us-west-2:123456789012:function:my-function'
) AS lambda_arn_1 \gset
```

You can later provide any of these values as a parameter in calls to the `aws_lambda.invoke (p. 1661)` function. For examples, see [Invoking Lambda functions \(p. 1659\)](#).

## Giving RDS access to Lambda

To use a Lambda function, give your PostgreSQL DB instance permission to access Lambda. To do this, use the following procedure.

### To give a PostgreSQL DB instance access to Lambda

1. Create an IAM policy.

This policy provides the permissions that allow your PostgreSQL DB instance to invoke Lambda functions.

As part of creating this policy, take the following steps:

- a. Include in the policy the required action `lambda:InvokeFunction` to allow Lambda invocation from your RDS for PostgreSQL DB instance.
- b. Include the Amazon Resource Name (ARN) that identifies the Lambda function. The ARN format for accessing Lambda is: `arn:aws:lambda:::function:example_function/*`

For more information on creating an IAM policy for RDS for PostgreSQL, see [Creating and using an IAM policy for IAM database access](#). See also [IAM Tutorial: Create and attach your first customer managed policy](#) in the *IAM User Guide*.

The following AWS CLI command creates an IAM policy named `rds-lambda-policy` with these options. It grants access to a function named `example_function`.

```
aws iam create-policy --policy-name rds-lambda-policy --policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowAccessToExampleFunction",
 "Effect": "Allow",
 "Action": "lambda:InvokeFunction",
 "Resource": "arn:aws:lambda:<region>:<123456789012>:function:example_function"
 }
]
}'
```

After you create the policy, note the ARN of the policy. You need the ARN for a subsequent step when you attach the policy to an IAM role.

2. Create an IAM role.

You do this so that RDS for PostgreSQL can assume this IAM role on your behalf to access your Lambda function. For more information, see [Creating a role to delegate permissions to an IAM user](#) in the *IAM User Guide*.

The following example shows using the AWS CLI command to create a role named `rds-lambda-role`.

```
aws iam create-role --role-name rds-lambda-role --assume-role-policy-document '{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Principal": {
 "Service": "rds.amazonaws.com"
 },
 "Action": "sts:AssumeRole"
 }
]
}'
```

3. Attach the IAM policy that you created to the IAM role that you created.

The following AWS CLI command attaches the policy created earlier to the role named `rds-lambda-role`. Replace `your-policy-arn` with the policy ARN that you noted in an earlier step.

```
aws iam attach-role-policy --policy-arn your-policy-arn --role-name rds-lambda-role
```

4. Add the IAM role to the DB instance. You do so by using the AWS CLI, as described following.

Use the following CLI command to add the IAM role to the RDS for PostgreSQL DB instance named `my-db-instance`. Replace `your-role-arn` with the role ARN that you noted in a previous step. Use `Lambda` for the value of the `--feature-name` option, as shown following.

```
aws rds add-role-to-db-instance \
```

```
--db-instance-identifier my-db-instance \
--feature-name Lambda \
--role-arn your-role-arn \
--region your-region
```

## Invoking Lambda functions

Following, you can find some examples of calling the [aws\\_lambda.invoke \(p. 1661\)](#) function. Before you use the `aws_lambda.invoke` function, be sure to complete the following prerequisites:

- Install the required PostgreSQL extensions as described in [Overview of using a Lambda function \(p. 1656\)](#).
- Determine which Lambda function to invoke as described in [Specifying the Lambda function to use \(p. 1657\)](#).
- Make sure that the DB instance has invoke access to Lambda as described in [Giving RDS access to Lambda \(p. 1657\)](#).

You can invoke a Lambda function synchronously or asynchronously. You control this with the following values for the [aws\\_lambda.invoke \(p. 1661\)](#) function's `invocation_type` parameter:

- The `RequestResponse` type of invocation for a Lambda function is synchronous and returns a response payload in the result of the `aws_lambda.invoke` function. Use the `RequestResponse` invocation type when your workflow depends on receiving the Lambda function result immediately. Most of the following examples use synchronous invocation.

The `RequestResponse` type of invocation is the default.

- The `Event` type of invocation for a Lambda function is asynchronous and returns immediately without a returned payload. Use the `Event` type of invocation when you don't need to know the result of the Lambda function before your workflow moves on. For an example of asynchronous invocation, see [Asynchronous event invocation of Lambda functions \(p. 1660\)](#).

The following [aws\\_lambda.invoke \(p. 1661\)](#) examples use a `aws_lambda_arn_1` structure, which contains the identifying information for the Lambda function. To create the structure, use the [aws\\_commons.create\\_lambda\\_function\\_arn \(p. 1663\)](#) function. For an example of using the `aws_commons.create_lambda_function_arn` function, see [Specifying the Lambda function to use \(p. 1657\)](#).

### Topics

- [Synchronous RequestResponse invocation of Lambda functions \(p. 1659\)](#)
- [Asynchronous event invocation of Lambda functions \(p. 1660\)](#)
- [Requesting a Lambda execution log in a function response \(p. 1660\)](#)
- [Including client context in a Lambda function \(p. 1660\)](#)
- [Invoking a specific version of a Lambda function \(p. 1660\)](#)
- [Lambda function error handling \(p. 1661\)](#)

## Synchronous RequestResponse invocation of Lambda functions

Following is an example of a synchronous Lambda function invocation. The following two `aws_lambda.invoke` function call results are the same.

```
psql=> SELECT * FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"'}::json);
```

```
psql=> SELECT * FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json, 'RequestResponse');
```

The parameters are described as follows:

- `:'aws_lambda_arn_1'` – This parameter is a structure that identifies the Lambda function to call. This example uses a variable to identify the previously created structure. You can instead create the structure by including the [aws\\_commons.create\\_lambda\\_function\\_arn \(p. 1663\)](#) function call inline within the [aws\\_lambda.invoke \(p. 1661\)](#) function call as follows.

```
psql=> SELECT * FROM aws_lambda.invoke(aws_commons.create_lambda_function_arn('my-function', 'us-west-2'), '{"body": "Hello from Postgres!"}':json);
```

- `'{"body": "Hello from PostgreSQL!"}':json` – The JSON payload to pass to the Lambda function.
- `'RequestResponse'` – The Lambda invocation type.

## Asynchronous event invocation of Lambda functions

Following is an example of an asynchronous Lambda function invocation. The `Event` invocation type schedules the Lambda function invocation with the specified input payload and returns immediately. Use the `Event` invocation type in certain workflows that don't depend on the results of the Lambda function.

```
psql=> SELECT * FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json, 'Event');
```

## Requesting a Lambda execution log in a function response

You can request to include the last 4 KB of the execution log in the function response, as shown following.

```
psql=> SELECT *, select convert_from(decode(log_result, 'base64'), 'utf-8') as log FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json, 'RequestResponse', 'Tail');
```

Set the [aws\\_lambda.invoke \(p. 1661\)](#) function's `log_type` parameter to `Tail` to include the execution log in the response. The default value for the `log_type` parameter is `None`.

The `log_result` that's returned is a `base64` encoded string. You can decode the contents using a combination of the `decode` and `convert_from` PostgreSQL functions.

## Including client context in a Lambda function

You can pass in client context information that is separate from the payload, as shown following.

```
psql=> SELECT *, convert_from(decode(log_result, 'base64'), 'utf-8') as log FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json, 'RequestResponse', 'Tail');
```

To include client context, use a JSON object for the [aws\\_lambda.invoke \(p. 1661\)](#) function's `context` parameter.

## Invoking a specific version of a Lambda function

For an example of invoking a specific version of a Lambda function, see the following.

```
psql=> SELECT * FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json, 'RequestResponse', 'None', NULL, 'custom_version');
```

To identify a Lambda function's version, use the [aws\\_lambda.invoke \(p. 1661\)](#) function's `qualifier` parameter. In this example, '`custom_version`' is an alias or version that identifies the version of the function to invoke.

You can instead supply a Lambda function qualifier with the function name information as follows.

```
psql=> SELECT * FROM aws_lambda.invoke(aws_commons.create_lambda_function_arn('my-function:custom_version', 'us-west-2'), '{"body": "Hello from Postgres!"}':json);
```

## Lambda function error handling

If a Lambda function throws an exception during request processing, `aws_lambda.invoke` fails with a PostgreSQL error such as the following.

```
psql=> SELECT * FROM aws_lambda.invoke(:'aws_lambda_arn_1', '{"body": "Hello from Postgres!"}':json);
ERROR: lambda invocation failed
DETAIL: "arn:aws:lambda:us-west-2:123456789012:function:my-function" returned error
"Unhandled", details: "<Error details string>".
```

## Function reference

Following is the reference for the functions to use for invoking Lambda functions with RDS for PostgreSQL.

### Functions

- [aws\\_lambda.invoke \(p. 1661\)](#)
- [aws\\_commons.create\\_lambda\\_function\\_arn \(p. 1663\)](#)

### aws\_lambda.invoke

Runs a Lambda function for an RDS for PostgreSQL DB instance.

For more details about invoking Lambda functions, see also [Invoke](#) in the *AWS Lambda Developer Guide*.

### Syntax

JSON

```
aws_lambda.invoke(
 IN function_name TEXT,
 IN payload JSON,
 IN region TEXT DEFAULT NULL,
 IN invocation_type TEXT DEFAULT 'RequestResponse',
 IN log_type TEXT DEFAULT 'None',
 IN context JSON DEFAULT NULL,
 IN qualifier VARCHAR(128) DEFAULT NULL,
 OUT status_code INT,
 OUT payload JSON,
 OUT executed_version TEXT,
```

```
OUT log_result TEXT)
```

```
aws_lambda.invoke(
 IN function_name aws_commons._lambda_function_arn_1,
 IN payload JSON,
 IN invocation_type TEXT DEFAULT 'RequestResponse',
 IN log_type TEXT DEFAULT 'None',
 IN context JSON DEFAULT NULL,
 IN qualifier VARCHAR(128) DEFAULT NULL,
 OUT status_code INT,
 OUT payload JSON,
 OUT executed_version TEXT,
 OUT log_result TEXT)
```

## JSONB

```
aws_lambda.invoke(
 IN function_name TEXT,
 IN payload JSONB,
 IN region TEXT DEFAULT NULL,
 IN invocation_type TEXT DEFAULT 'RequestResponse',
 IN log_type TEXT DEFAULT 'None',
 IN context JSONB DEFAULT NULL,
 IN qualifier VARCHAR(128) DEFAULT NULL,
 OUT status_code INT,
 OUT payload JSONB,
 OUT executed_version TEXT,
 OUT log_result TEXT)
```

```
aws_lambda.invoke(
 IN function_name aws_commons._lambda_function_arn_1,
 IN payload JSONB,
 IN invocation_type TEXT DEFAULT 'RequestResponse',
 IN log_type TEXT DEFAULT 'None',
 IN context JSONB DEFAULT NULL,
 IN qualifier VARCHAR(128) DEFAULT NULL,
 OUT status_code INT,
 OUT payload JSONB,
 OUT executed_version TEXT,
 OUT log_result TEXT
)
```

## Input parameters

### *function\_name*

The identifying name of the Lambda function. The value can be the function name, an ARN, or a partial ARN. For a listing of possible formats, see [Lambda function name formats](#) in the *AWS Lambda Developer Guide*.

### *payload*

The input for the Lambda function. The format can be JSON or JSONB. For more information, see [JSON Types](#) in the PostgreSQL documentation.

### *region*

(Optional) The Lambda Region for the function. By default, RDS resolves the AWS Region from the full ARN in the *function\_name* or it uses the RDS for PostgreSQL DB instance Region. If this Region value conflicts with the one provided in the *function\_name* ARN, an error is raised.

#### *invocation\_type*

The invocation type of the Lambda function. The value is case-sensitive. Possible values include the following:

- `RequestResponse` – The default. This type of invocation for a Lambda function is synchronous and returns a response payload in the result. Use the `RequestResponse` invocation type when your workflow depends on receiving the Lambda function result immediately.
- `Event` – This type of invocation for a Lambda function is asynchronous and returns immediately without a returned payload. Use the `Event` invocation type when you don't need results of the Lambda function before your workflow moves on.
- `DryRun` – This type of invocation tests access without running the Lambda function.

#### *log\_type*

The type of Lambda log to return in the `log_result` output parameter. The value is case-sensitive. Possible values include the following:

- `Tail` – The returned `log_result` output parameter will include the last 4 KB of the execution log.
- `None` – No Lambda log information is returned.

#### *context*

Client context in JSON or JSONB format. Fields to use include `custom` and `env`.

#### *qualifier*

A qualifier that identifies a Lambda function's version to be invoked. If this value conflicts with one provided in the `function_name` ARN, an error is raised.

## Output parameters

#### *status\_code*

An HTTP status response code. For more information, see [Lambda Invoke response elements](#) in the [AWS Lambda Developer Guide](#).

#### *payload*

The information returned from the Lambda function that ran. The format is in JSON or JSONB.

#### *executed\_version*

The version of the Lambda function that ran.

#### *log\_result*

The execution log information returned if the `log_type` value is `Tail` when the Lambda function was invoked. The result contains the last 4 KB of the execution log encoded in Base64.

## [aws\\_commons.create\\_lambda\\_function\\_arn](#)

Creates an `aws_commons._lambda_function_arn_1` structure to hold Lambda function name information. You can use the results of the `aws_commons.create_lambda_function_arn` function in the `function_name` parameter of the `aws_lambda.invoke` ([p. 1661](#)) function.

### Syntax

```
aws_commons.create_lambda_function_arn(
 function_name TEXT,
 region TEXT DEFAULT NULL
)
```

```
RETURNS aws_commons._lambda_function_arn_1
```

### Input parameters

*function\_name*

A required text string containing the Lambda function name. The value can be a function name, a partial ARN, or a full ARN.

*region*

An optional text string containing the AWS Region that the Lambda function is in. For a listing of Region names and associated values, see [Regions, Availability Zones, and Local Zones \(p. 48\)](#).

# Security in Amazon RDS

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security of the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS compliance programs](#). To learn about the compliance programs that apply to Amazon RDS, see [AWS services in scope by compliance program](#).
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Amazon RDS. The following topics show you how to configure Amazon RDS to meet your security and compliance objectives. You also learn how to use other AWS services that help you monitor and secure your Amazon RDS resources.

You can manage access to your Amazon RDS resources and your databases on a DB instance. The method you use to manage access depends on what type of task the user needs to perform with Amazon RDS:

- Run your DB instance in a virtual private cloud (VPC) based on the Amazon VPC service for the greatest possible network access control. For more information about creating a DB instance in a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).
- Use AWS Identity and Access Management (IAM) policies to assign permissions that determine who is allowed to manage Amazon RDS resources. For example, you can use IAM to determine who is allowed to create, describe, modify, and delete DB instances, tag resources, or modify security groups.
- Use security groups to control what IP addresses or Amazon EC2 instances can connect to your databases on a DB instance. When you first create a DB instance, its firewall prevents any database access except through rules specified by an associated security group.
- Use Secure Socket Layer (SSL) or Transport Layer Security (TLS) connections with DB instances running the MySQL, MariaDB, PostgreSQL, Oracle, or Microsoft SQL Server database engines. For more information on using SSL/TLS with a DB instance, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).
- Use Amazon RDS encryption to secure your DB instances and snapshots at rest. Amazon RDS encryption uses the industry standard AES-256 encryption algorithm to encrypt your data on the server that hosts your DB instance. For more information, see [Encrypting Amazon RDS resources \(p. 1668\)](#).
- Use network encryption and transparent data encryption with Oracle DB instances; for more information, see [Oracle native network encryption \(p. 1188\)](#) and [Oracle Transparent Data Encryption \(p. 1216\)](#).
- Use the security features of your DB engine to control who can log in to the databases on a DB instance. These features work just as if the database was on your local network.

## Note

You only have to configure security for your use cases. You don't have to configure security access for processes that Amazon RDS manages. These include creating backups, replicating data between a primary DB instance and a read replica, and other processes.

For more information on managing access to Amazon RDS resources and your databases on a DB instance, see the following topics.

**Topics**

- [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#)

## Database authentication with Amazon RDS

Amazon RDS supports several ways to authenticate database users.

Password, Kerberos, and IAM database authentication use different methods of authenticating to the database. Therefore, a specific user can log in to a database using only one authentication method.

For PostgreSQL, use only one of the following role settings for a user of a specific database:

- To use IAM database authentication, assign the `rds_iam` role to the user.
- To use Kerberos authentication, assign the `rds_ad` role to the user.
- To use password authentication, don't assign either the `rds_iam` or `rds_ad` roles to the user.

Don't assign both the `rds_iam` and `rds_ad` roles to a user of a PostgreSQL database either directly or indirectly by nested grant access. If the `rds_iam` role is added to the master user, IAM authentication takes precedence over password authentication so the master user has to log in as an IAM user.

**Topics**

- [Password authentication \(p. 1666\)](#)
- [IAM database authentication \(p. 1667\)](#)
- [Kerberos authentication \(p. 1667\)](#)

## Password authentication

With *password authentication*, your DB instance performs all administration of user accounts. You create users with SQL statements such as `CREATE USER` and specify passwords in the `IDENTIFIED BY` clause.

All RDS DB engines support password authentication. For more information about password authentication, see the documentation for your DB engine.

With password authentication, your database controls and authenticates user accounts. If a DB engine has strong password management features, they can enhance security. Database authentication might be easier to administer using password authentication when you have small user communities. Because

clear text passwords are generated in this case, integrating with AWS Secrets Manager can enhance security.

For information about using Secrets Manager with Amazon RDS, see [Creating a basic secret](#) and [Rotating secrets for supported Amazon RDS databases](#) in the *AWS Secrets Manager User Guide*. For information about programmatically retrieving your secrets in your custom applications, see [Retrieving the secret value](#) in the *AWS Secrets Manager User Guide*.

## IAM database authentication

You can authenticate to your DB instance using AWS Identity and Access Management (IAM) database authentication. IAM database authentication works with MySQL and PostgreSQL. With this authentication method, you don't need to use a password when you connect to a DB instance. Instead, you use an authentication token.

For more information about IAM database authentication, including information about availability for specific DB engines, see [IAM database authentication for MySQL and PostgreSQL \(p. 1698\)](#).

## Kerberos authentication

Amazon RDS supports external authentication of database users using Kerberos and Microsoft Active Directory. Kerberos is a network authentication protocol that uses tickets and symmetric-key cryptography to eliminate the need to transmit passwords over the network. Kerberos has been built into Active Directory and is designed to authenticate users to network resources, such as databases.

Amazon RDS support for Kerberos and Active Directory provides the benefits of single sign-on and centralized authentication of database users. You can keep your user credentials in Active Directory. Active Directory provides a centralized place for storing and managing credentials for multiple DB instances.

You can enable your database users to authenticate against DB instances in two ways. They can use credentials stored either in AWS Directory Service for Microsoft Active Directory or in your on-premises Active Directory.

Microsoft SQL Server, MySQL, and PostgreSQL DB instances support one- and two-way forest trust relationships. Oracle DB instances support one- and two-way external and forest trust relationships. For more information, see [When to create a trust relationship](#) in the *AWS Directory Service Administration Guide*.

For information about Kerberos authentication with a specific DB engine, see the following:

- [Using Windows Authentication with an Amazon RDS for SQL Server DB instance \(p. 719\)](#)
- [Using Kerberos authentication for MySQL \(p. 948\)](#)
- [Configuring Kerberos authentication for Amazon RDS for Oracle \(p. 1026\)](#)
- [Using Kerberos authentication with Amazon RDS for PostgreSQL \(p. 1558\)](#)

### Note

Currently, Kerberos authentication isn't supported for MariaDB DB instances.

## Data protection in Amazon RDS

The AWS [shared responsibility model](#) applies to data protection in Amazon Relational Database Service. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the

AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the [AWS Security Blog](#).

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put sensitive identifying information, such as your customers' account numbers, into free-form fields such as a **Name** field. This includes when you work with Amazon RDS or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into Amazon RDS or other services might get picked up for inclusion in diagnostic logs. When you provide a URL to an external server, don't include credentials information in the URL to validate your request to that server.

#### Topics

- [Protecting data using encryption \(p. 1668\)](#)
- [Internetwork traffic privacy \(p. 1681\)](#)

## Protecting data using encryption

You can enable encryption for database resources. You can also encrypt connections to DB instances.

#### Topics

- [Encrypting Amazon RDS resources \(p. 1668\)](#)
- [Customer master key \(CMK\) management \(p. 1671\)](#)
- [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#)
- [Rotating your SSL/TLS certificate \(p. 1673\)](#)

## Encrypting Amazon RDS resources

Amazon RDS can encrypt your Amazon RDS DB instances. Data that is encrypted at rest includes the underlying storage for DB instances, its automated backups, read replicas, and snapshots.

Amazon RDS encrypted DB instances use the industry standard AES-256 encryption algorithm to encrypt your data on the server that hosts your Amazon RDS DB instances. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data transparently with a minimal impact on performance. You don't need to modify your database client applications to use encryption.

#### Note

For encrypted and unencrypted DB instances, data that is in transit between the source and the read replicas is encrypted, even when replicating across AWS Regions.

## Topics

- [Overview of encrypting Amazon RDS resources \(p. 1669\)](#)
- [Enabling Amazon RDS encryption for a DB instance \(p. 1669\)](#)
- [Availability of Amazon RDS encryption \(p. 1670\)](#)
- [Limitations of Amazon RDS encrypted DB instances \(p. 1670\)](#)

## Overview of encrypting Amazon RDS resources

Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest.

Amazon RDS also supports encrypting an Oracle or SQL Server DB instance with Transparent Data Encryption (TDE). TDE can be used with encryption at rest, although using TDE and encryption at rest simultaneously might slightly affect the performance of your database. You must manage different keys for each encryption method. For more information on TDE, see [Oracle Transparent Data Encryption \(p. 1216\)](#) or [Support for Transparent Data Encryption in SQL Server \(p. 762\)](#).

For an Amazon RDS encrypted DB instance, all logs, backups, and snapshots are encrypted. Amazon RDS uses an AWS KMS customer master key (CMK) to encrypt these resources. For more information about CMKs, see [Customer master keys \(CMKs\)](#) in the *AWS Key Management Service Developer Guide*. If you copy an encrypted snapshot, you can use a different CMK to encrypt the target snapshot than the one that was used to encrypt the source snapshot.

A read replica of an Amazon RDS encrypted instance must be encrypted using the same CMK as the primary DB instance when both are in the same AWS Region. If the primary DB instance and read replica are in different AWS Regions, you encrypt the read replica using the CMK for that AWS Region.

To manage the customer master keys (CMKs) used for encrypting and decrypting your Amazon RDS resources, you use the [AWS Key Management Service \(AWS KMS\)](#). AWS KMS combines secure, highly available hardware and software to provide a key management system scaled for the cloud. Using AWS KMS, you can create CMKs and define the policies that control how these CMKs can be used. AWS KMS supports CloudTrail, so you can audit CMK usage to verify that CMKs are being used appropriately. You can use your CMKs with Amazon RDS and supported AWS services such as Amazon S3, Amazon EBS, and Amazon Redshift. For a list of services that are integrated with AWS KMS, see [Supported services](#) in the *AWS Key Management Service Developer Guide*.

## Enabling Amazon RDS encryption for a DB instance

To enable encryption for a new DB instance, choose **Enable encryption** on the Amazon RDS console. For information on creating a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

If you use the `create-db-instance` AWS CLI command to create an encrypted DB instance, set the `--storage-encrypted` parameter. If you use the `CreateDBInstance` API operation, set the `StorageEncrypted` parameter to true.

When you create an encrypted DB instance, you can choose a customer managed CMK or the AWS managed CMK for Amazon RDS to encrypt your DB instance. If you don't specify the key identifier for a customer managed CMK, Amazon RDS uses the AWS managed CMK for your new DB instance. Amazon RDS creates an AWS managed CMK for Amazon RDS for your AWS account. Your AWS account has a different AWS managed CMK for Amazon RDS for each AWS Region.

Once you have created an encrypted DB instance, you can't change the CMK used by that DB instance. Therefore, be sure to determine your CMK requirements before you create your encrypted DB instance.

If you use the AWS CLI `create-db-instance` command to create an encrypted DB instance with a customer managed CMK, set the `--kms-key-id` parameter to any key identifier for the CMK. If you use

the Amazon RDS API `CreateDBInstance` operation, set the `KmsKeyId` parameter to any key identifier for the CMK. To use a customer managed CMK in a different AWS account, specify the key ARN or alias ARN.

**Important**

If Amazon RDS loses access to the CMK for a DB instance—for example, when RDS access to a CMK is revoked—then the encrypted DB instance goes into a terminal state. In this case, you can only restore the DB instance from a backup. We strongly recommend that you always enable backups for encrypted DB instances to guard against the loss of encrypted data in your databases.

## Availability of Amazon RDS encryption

Amazon RDS encryption is currently available for all database engines and storage types.

Amazon RDS encryption is available for most DB instance classes. The following table lists DB instance classes that *do not support* Amazon RDS encryption:

Instance type	Instance class
General Purpose (M1)	db.m1.small
	db.m1.medium
	db.m1.large
	db.m1.xlarge
Memory Optimized (M2)	db.m2.xlarge
	db.m2.2xlarge
	db.m2.4xlarge
Burst Capable (T2)	db.t2.micro

**Note**

Encryption at rest is not available for DB instances running SQL Server Express Edition.

## Limitations of Amazon RDS encrypted DB instances

The following limitations exist for Amazon RDS encrypted DB instances:

- You can only enable encryption for an Amazon RDS DB instance when you create it, not after the DB instance is created.

However, because you can encrypt a copy of an unencrypted snapshot, you can effectively add encryption to an unencrypted DB instance. That is, you can create a snapshot of your DB instance, and then create an encrypted copy of that snapshot. You can then restore a DB instance from the encrypted snapshot, and thus you have an encrypted copy of your original DB instance. For more information, see [Copying a snapshot \(p. 355\)](#).

- You can't disable encryption on an encrypted DB instance.
- You can't create an encrypted snapshot of an unencrypted DB instance.
- A snapshot of an encrypted DB instance must be encrypted using the same CMK as the DB instance.
- You can't have an encrypted read replica of an unencrypted DB instance or an unencrypted read replica of an encrypted DB instance.

- Encrypted read replicas must be encrypted with the same CMK as the source DB instance when both are in the same AWS Region.
- You can't restore an unencrypted backup or snapshot to an encrypted DB instance.
- To copy an encrypted snapshot from one AWS Region to another, you must specify the CMK in the destination AWS Region. This is because CMKs are specific to the AWS Region that they are created in.

The source snapshot remains encrypted throughout the copy process. Amazon RDS uses envelope encryption to protect data during the copy process. For more information about envelope encryption, see [Envelope encryption in the AWS Key Management Service Developer Guide](#).

- You can't unencrypt an encrypted DB instance. However, you can export data from an encrypted DB instance and import the data into an unencrypted DB instance.

## Customer master key (CMK) management

Amazon RDS automatically integrates with AWS Key Management Service (AWS KMS) for key management. Amazon RDS uses envelope encryption. For more information about envelope encryption, see [Envelope encryption in the AWS Key Management Service Developer Guide](#).

A *customer master key (CMK)* is a logical representation of a master key. The CMK includes metadata, such as the key ID, creation date, description, and key state. The CMK also contains the key material used to encrypt and decrypt data. For more information about customer managed CMKs, see [Customer managed CMKs in the AWS Key Management Service Developer Guide](#).

You can manage CMKs used for Amazon RDS encrypted DB instances using the [AWS Key Management Service \(AWS KMS\)](#) in the [AWS KMS console](#), the AWS CLI, or the AWS KMS API. If you want full control over a CMK, then you must create a customer managed CMK.

*AWS managed CMKs* are CMKs in your account that are created, managed, and used on your behalf by an AWS service that is integrated with AWS KMS. You can't delete, edit, or rotate AWS managed CMKs. For more information about AWS managed CMKs, see [AWS managed CMKs in the AWS Key Management Service Developer Guide](#).

You can't share a snapshot that has been encrypted using the AWS managed CMK of the AWS account that shared the snapshot.

You can view audit logs of every action taken with an AWS managed or customer managed CMK by using [AWS CloudTrail](#).

### Important

When RDS encounters a DB instance encrypted by a CMK that RDS doesn't have access to, RDS puts the DB instance into a terminal state. In this state, the DB instance is no longer available and the current state of the database can't be recovered. To restore the DB instance, you must re-enable access to the CMK for RDS, and then restore the DB instance from a backup.

## Authorizing use of the CMK

When RDS uses a CMK in cryptographic operations, it acts on behalf of the user who is creating or changing the RDS resource.

To use the customer managed CMK for an RDS resource on your behalf, a user must have permissions to call the following operations on the CMK:

- `kms:GenerateDataKey`
- `kms:Decrypt`

You can specify these required permissions in a key policy, or in an IAM policy if the key policy allows it.

You can make the IAM policy stricter in various ways. For example, to allow the CMK to be used only for requests that originate in RDS, you can use the [kms:ViaService condition key](#) with the `rds.<region>.amazonaws.com` value.

You can also use the keys or values in the [encryption context](#) as a condition for using the CMK for cryptographic operations.

## Using SSL/TLS to encrypt a connection to a DB instance

You can use Secure Socket Layer (SSL) or Transport Layer Security (TLS) from your application to encrypt a connection to a DB instance running MySQL, MariaDB, SQL Server, Oracle, or PostgreSQL. Each DB engine has its own process for implementing SSL/TLS. To learn how to implement SSL/TLS for your DB instance, use the link following that corresponds to your DB engine:

- [Using SSL with a MariaDB DB instance \(p. 591\)](#)
- [Using SSL with a Microsoft SQL Server DB instance \(p. 711\)](#)
- [Using SSL with a MySQL DB instance \(p. 843\)](#)
- [Encrypting client connections with SSL \(p. 1022\)](#)
- [Using SSL with a PostgreSQL DB instance \(p. 1551\)](#)

### Note

All certificates are only available for download using SSL/TLS connections.

To get a certificate bundle that contains both the intermediate and root certificates for all AWS Regions, download from <https://truststore.pki.rds.amazonaws.com/global/global-bundle.pem>.

If your application is on Microsoft Windows and requires a PKCS7 file, you can download the PKCS7 certificate bundle. This bundle contains both the intermediate and root certificates at <https://truststore.pki.rds.amazonaws.com/global/global-bundle.p7b>.

### Note

Amazon RDS Proxy uses certificates from the AWS Certificate Manager (ACM). If you are using RDS Proxy, you don't need to download Amazon RDS certificates or update applications that use RDS Proxy connections. For more information about using TLS/SSL with RDS Proxy, see [Using TLS/SSL with RDS Proxy \(p. 170\)](#).

## Certificate bundles for AWS Regions

To get a certificate bundle that contains both the intermediate and root certificates for an AWS Region, download from the link for the AWS Region in the following table.

AWS Region	Certificate bundle (PEM)	Certificate bundle (PKCS7)
US East (N. Virginia)	<a href="#">us-east-1-bundle.pem</a>	<a href="#">us-east-1-bundle.p7b</a>
US East (Ohio)	<a href="#">us-east-2-bundle.pem</a>	<a href="#">us-east-2-bundle.p7b</a>
US West (N. California)	<a href="#">us-west-1-bundle.pem</a>	<a href="#">us-west-1-bundle.p7b</a>
US West (Oregon)	<a href="#">us-west-2-bundle.pem</a>	<a href="#">us-west-2-bundle.p7b</a>
Africa (Cape Town)	<a href="#">af-south-1-bundle.pem</a>	<a href="#">af-south-1-bundle.p7b</a>
Asia Pacific (Hong Kong)	<a href="#">ap-east-1-bundle.pem</a>	<a href="#">ap-east-1-bundle.p7b</a>
Asia Pacific (Mumbai)	<a href="#">ap-south-1-bundle.pem</a>	<a href="#">ap-south-1-bundle.p7b</a>
Asia Pacific (Osaka)	<a href="#">ap-northeast-3-bundle.pem</a>	<a href="#">ap-northeast-3-bundle.p7b</a>

## AWS GovCloud (US) certificates

To get a certificate bundle that contains both the intermediate and root certificates for the AWS GovCloud (US) Regions, download from <https://truststore.pki.us-gov-west-1.rds.amazonaws.com/global/global-bundle.pem>.

If your application is on Microsoft Windows and requires a PKCS7 file, you can download the PKCS7 certificate bundle. This bundle contains both the intermediate and root certificates at <https://truststore.pki.us-gov-west-1.rds.amazonaws.com/global/global-bundle.p7b>.

To get a certificate bundle that contains both the intermediate and root certificates for an AWS GovCloud (US) Region, download from the link for the AWS GovCloud (US) Region in the following table.

AWS GovCloud (US) Region	Certificate bundle (PEM)	Certificate bundle (PKCS7)
AWS GovCloud (US-East)	<a href="#">us-gov-east-1-bundle.pem</a>	<a href="#">us-gov-east-1-bundle.p7b</a>
AWS GovCloud (US-West)	<a href="#">us-gov-west-1-bundle.pem</a>	<a href="#">us-gov-west-1-bundle.p7b</a>

## Rotating your SSL/TLS certificate

As of March 5, 2020, Amazon RDS CA-2015 certificates have expired. If you use or plan to use Secure Sockets Layer (SSL) or Transport Layer Security (TLS) with certificate verification to connect to your RDS DB instances, you require Amazon RDS CA-2019 certificates, which are enabled by default for new DB instances. If you currently do not use SSL/TLS with certificate verification, you might still have expired CA-2015 certificates and must update them to CA-2019 certificates if you plan to use SSL/TLS with certificate verification to connect to your RDS databases.

Follow these instructions to complete your updates. Before you update your DB instances to use the new CA certificate, make sure that you update your clients or applications connecting to your RDS databases.

Amazon RDS provides new CA certificates as an AWS security best practice. For information about the new certificates and the supported AWS Regions, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

**Note**

Amazon RDS Proxy uses certificates from the AWS Certificate Manager (ACM). If you are using RDS Proxy, when you rotate your SSL/TLS certificate, you don't need to update applications that use RDS Proxy connections. For more information about using TLS/SSL with RDS Proxy, see [Using TLS/SSL with RDS Proxy \(p. 170\)](#).

**Note**

If you are using a Go version 1.15 application with a DB instance that was created or updated to the `rds-ca-2019` certificate prior to July 28, 2020, you must update the certificate again. Run the `modify-db-instance` command shown in the AWS CLI section using `rds-ca-2019` as the CA certificate identifier. In this case, it isn't possible to update the certificate using the AWS Management Console. If you created your DB instance or updated its certificate after July 28, 2020, no action is required. For more information, see [Go GitHub issue #39568](#).

**Topics**

- [Updating your CA certificate by modifying your DB instance \(p. 1674\)](#)
- [Updating your CA certificate by applying DB instance maintenance \(p. 1676\)](#)
- [Sample script for importing certificates into your trust store \(p. 1680\)](#)

## Updating your CA certificate by modifying your DB instance

Complete the following steps to update your CA certificate.

### To update your CA certificate by modifying your DB instance

1. Download the new SSL/TLS certificate as described in [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).
2. Update your applications to use the new SSL/TLS certificate.

The methods for updating applications for new SSL/TLS certificates depend on your specific applications. Work with your application developers to update the SSL/TLS certificates for your applications.

For information about checking for SSL/TLS connections and updating applications for each DB engine, see the following topics:

- [Updating applications to connect to MariaDB DB instances using new SSL/TLS certificates \(p. 601\)](#)
- [Updating applications to connect to Microsoft SQL Server DB instances using new SSL/TLS certificates \(p. 669\)](#)
- [Updating applications to connect to MySQL DB instances using new SSL/TLS certificates \(p. 857\)](#)
- [Updating applications to use new SSL/TLS certificates \(p. 1023\)](#)
- [Updating applications to connect to PostgreSQL DB instances using new SSL/TLS certificates \(p. 1554\)](#)

For a sample script that updates a trust store for a Linux operating system, see [Sample script for importing certificates into your trust store \(p. 1680\)](#).

**Note**

The certificate bundle contains certificates for both the old and new CA, so you can upgrade your application safely and maintain connectivity during the transition period. If you are using the AWS Database Migration Service to migrate a database to a DB instance, we recommend using the certificate bundle to ensure connectivity during the migration.

3. Modify the DB instance to change the CA from **rds-ca-2015** to **rds-ca-2019**.

**Important**

By default, this operation restarts your DB instance. If you don't want to restart your DB instance during this operation, you can use the `modify-db-instance` CLI command and specify the `--no-certificate-rotation-restart` option.

This option will not rotate the certificate until the next time the database restarts, either for planned or unplanned maintenance. This option is only recommended if you don't use SSL/TLS.

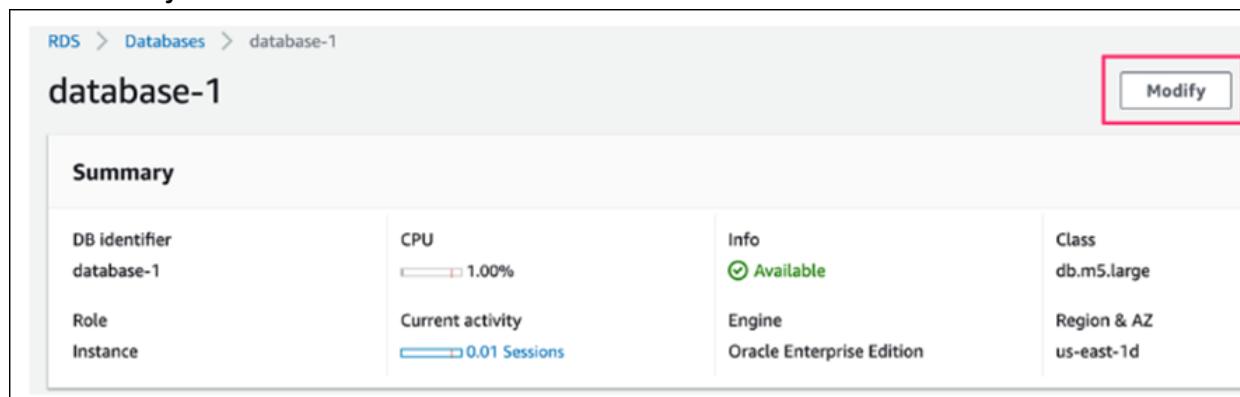

If you are experiencing connectivity issues after certificate expiry, use the `apply immediately` option by specifying **Apply immediately** in the console or by specifying the `--apply-immediately` option using the AWS CLI. By default, this operation is scheduled to run during your next maintenance window.

You can use the AWS Management Console or the AWS CLI to change the CA certificate from **rds-ca-2015** to **rds-ca-2019** for a DB instance.

[Console](#)

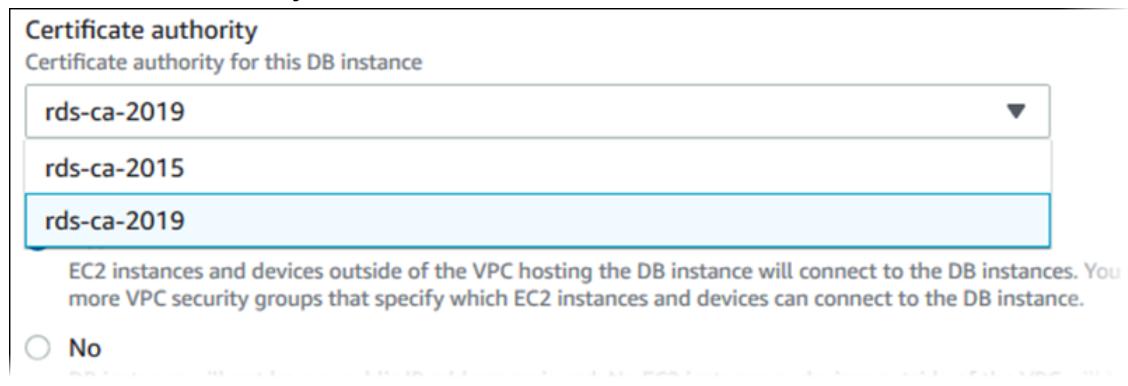

**To change the CA from rds-ca-2015 to rds-ca-2019 for a DB instance**

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**, and then choose the DB instance that you want to modify.
3. Choose **Modify**.

The **Modify DB Instance** page appears.

4. In the **Network & Security** section, choose **rds-ca-2019**.

5. Choose **Continue** and check the summary of modifications.

6. To apply the changes immediately, choose **Apply immediately**.

**Important**

Choosing this option restarts your database immediately.

7. On the confirmation page, review your changes. If they are correct, choose **Modify DB Instance** to save your changes.

**Important**

When you schedule this operation, make sure that you have updated your client-side trust store beforehand.

Or choose **Back** to edit your changes or **Cancel** to cancel your changes.

## AWS CLI

To use the AWS CLI to change the CA from `rds-ca-2015` to `rds-ca-2019` for a DB instance, call the `modify-db-instance` command. Specify the DB instance identifier and the `--ca-certificate-identifier` option.

**Important**

When you schedule this operation, make sure that you have updated your client-side trust store beforehand.

### Example

The following code modifies `mydbinstance` by setting the CA certificate to `rds-ca-2019`. The changes are applied during the next maintenance window by using `--no-apply-immediately`. Use `--apply-immediately` to apply the changes immediately.

**Important**

By default, this operation reboots your DB instance. If you don't want to reboot your DB instance during this operation, you can use the `modify-db-instance` CLI command and specify the `--no-certificate-rotation-restart` option.

This option will not rotate the certificate until the next time the database restarts, either for planned or unplanned maintenance. This option is only recommended if you do not use SSL/TLS.

Use `--apply-immediately` to apply the update immediately. By default, this operation is scheduled to run during your next maintenance window.

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
 --db-instance-identifier mydbinstance \
 --ca-certificate-identifier rds-ca-2019 \
 --no-apply-immediately
```

For Windows:

```
aws rds modify-db-instance ^
 --db-instance-identifier mydbinstance ^
 --ca-certificate-identifier rds-ca-2019 ^
 --no-apply-immediately
```

## Updating your CA certificate by applying DB instance maintenance

Complete the following steps to update your CA certificate by applying DB instance maintenance.

## To update your CA certificate by applying DB instance maintenance

1. Download the new SSL/TLS certificate as described in [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).
2. Update your database applications to use the new SSL/TLS certificate.

The methods for updating applications for new SSL/TLS certificates depend on your specific applications. Work with your application developers to update the SSL/TLS certificates for your applications.

For information about checking for SSL/TLS connections and updating applications for each DB engine, see the following topics:

- [Updating applications to connect to MariaDB DB instances using new SSL/TLS certificates \(p. 601\)](#)
- [Updating applications to connect to Microsoft SQL Server DB instances using new SSL/TLS certificates \(p. 669\)](#)
- [Updating applications to connect to MySQL DB instances using new SSL/TLS certificates \(p. 857\)](#)
- [Updating applications to use new SSL/TLS certificates \(p. 1023\)](#)
- [Updating applications to connect to PostgreSQL DB instances using new SSL/TLS certificates \(p. 1554\)](#)

For a sample script that updates a trust store for a Linux operating system, see [Sample script for importing certificates into your trust store \(p. 1680\)](#).

### Note

The certificate bundle contains certificates for both the old and new CA, so you can upgrade your application safely and maintain connectivity during the transition period.

3. Apply DB instance maintenance to change the CA from **rds-ca-2015** to **rds-ca-2019**.

### Important

You can choose to apply the change immediately. By default, this operation is scheduled to run during your next maintenance window.

You can use the AWS Management Console to apply DB instance maintenance to change the CA certificate from **rds-ca-2015** to **rds-ca-2019** for multiple DB instances.

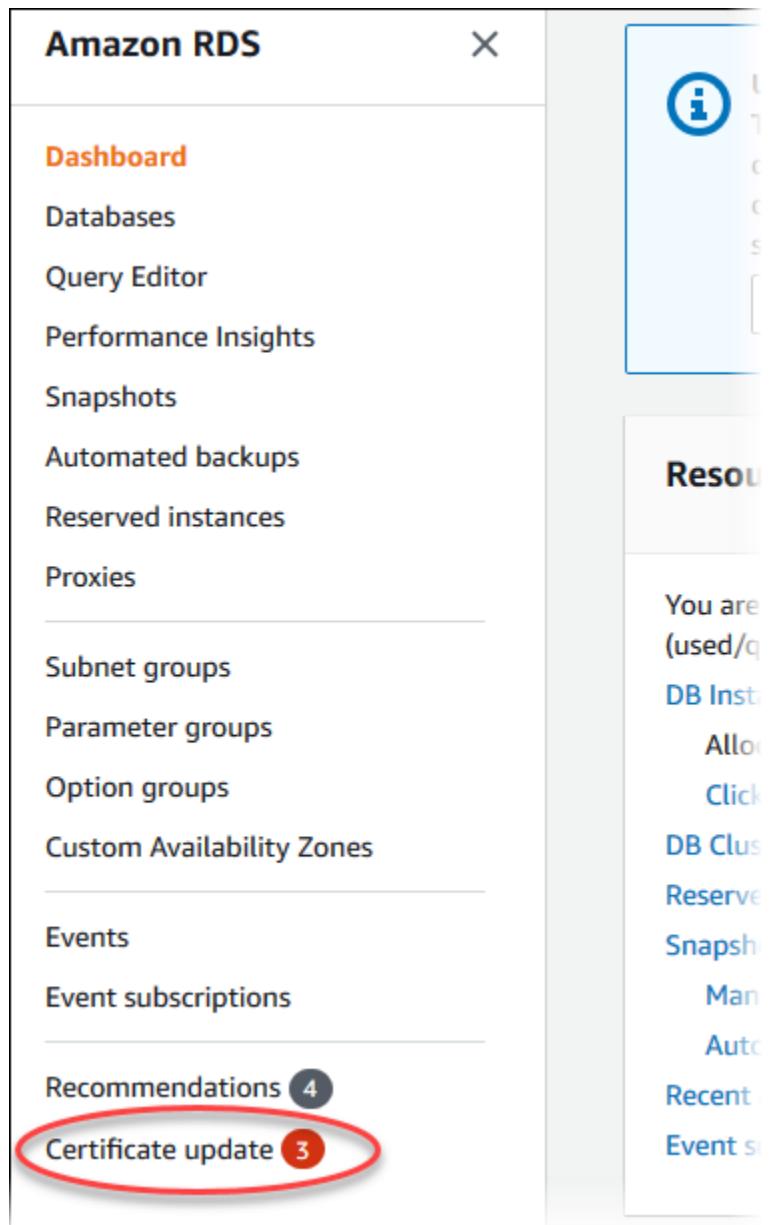

## Updating your CA certificate by applying maintenance to multiple DB instances

Use the AWS Management Console to change the CA certificate for multiple DB instances.

### To change the CA from **rds-ca-2015** to **rds-ca-2019** for multiple DB instances

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.

In the navigation pane, there is a **Certificate update** option that shows the total number of affected DB instances.

Choose **Certificate update** in the navigation pane.

The **Update your Amazon RDS SSL/TLS certificates** page appears.

RDS > Update Your Amazon RDS SSL/TLS Certificates

## Update your Amazon RDS SSL/TLS certificates before March 5, 2020

To avoid interruption of your applications using RDS and Aurora databases, update the Certificate Authority (CA) certificates for these databases before March 5, 2020. We strongly recommend making your updates before February 5, 2020, to leave time for deployments, testing, and validation. New databases created after January 14, 2020, will default to using the new CA certificates. Make sure that you update your client applications with the new certificates first. Find the new CA certificates and info: [RDS](#) [Aurora](#)

Databases requiring update (3)		<a href="#">Export this list to .csv</a>	<a href="#">Update now</a>	<a href="#">Update at the next maintenance window</a>
<a href="#"></a> <a href="#">Find resources</a> <span style="float: right;">&lt; 1 &gt; <a href="#"></a></span>				
DB identifier	DB cluster identifier	Status	Apply date	
<input checked="" type="radio"/> mydbinstancecf	-	Requires Update	-	
<input type="radio"/> mydbinstancecf2	-	Requires Update	-	
<input type="radio"/> oracledb	-	Requires Update	-	

**Note**

This page only shows the DB instances for the current AWS Region. If you have DB instances in more than one AWS Region, check this page in each AWS Region to see all DB instances with old SSL/TLS certificates.

3. Choose the DB instance you want to update.

You can schedule the certificate rotation for your next maintenance window by choosing **Update at the next maintenance window**. Apply the rotation immediately by choosing **Update now**.

**Important**

When your CA certificate is rotated, the operation restarts your DB instance.

If you experience connectivity issues after certificate expiry, use the **Update now** option.

4. If you choose **Update at the next maintenance window** or **Update now**, you are prompted to confirm the CA certificate rotation.

**Important**

Before scheduling the CA certificate rotation on your database, update any client applications that use SSL/TLS and the server certificate to connect. These updates are specific to your DB engine. To determine whether your applications use SSL/TLS and the server certificate to connect, see [Step 2: Update Your Database Applications to Use the New SSL/TLS Certificate \(p. 1677\)](#). After you have updated these client applications, you can confirm the CA certificate rotation.

**Confirm rotation of CA certificate?**

Before scheduling the CA certificate rotation, update client applications that connect to your database to use the new CA certificate. Not doing this will cause an interruption of connectivity between your applications and your database. [Get new CA certificates](#)

I understand that not doing so will break SSL/TLS connectivity to my database.

[Cancel](#)

[Confirm](#)

To continue, choose the check box, and then choose **Confirm**.

5. Repeat steps 3 and 4 for each DB instance that you want to update.

## Sample script for importing certificates into your trust store

The following are sample shell scripts that import the certificate bundle into a trust store.

### Topics

- [Sample script for importing certificates on Linux \(p. 1680\)](#)
- [Sample script for importing certificates on macOS \(p. 1680\)](#)

### Sample script for importing certificates on Linux

The following is a sample shell script that imports the certificate bundle into a trust store on a Linux operating system.

```
mydir=tmp/certs
if [! -e "${mydir}"]
then
mkdir -p "${mydir}"
fi

truststore=${mydir}/rds-truststore.jks
storepassword=changeit

curl -ss "https://s3.amazonaws.com/rds-downloads/rds-combined-ca-bundle.pem" > ${mydir}/
rds-combined-ca-bundle.pem
awk 'split_after == 1 {n++;split_after=0} /-----END CERTIFICATE-----/ {split_after=1}{print
> "rds-ca-" n ".pem"}' < ${mydir}/rds-combined-ca-bundle.pem

for CERT in rds-ca-*; do
alias=$(openssl x509 -noout -text -in $CERT | perl -ne 'next unless /Subject:/; s/.*(CN=|CN =)//; print')
echo "Importing $alias"
keytool -import -file ${CERT} -alias "${alias}" -storepass ${storepassword} -keystore
${truststore} -noprompt
rm ${CERT}
done

rm ${mydir}/rds-combined-ca-bundle.pem

echo "Trust store content is: "

keytool -list -v -keystore "$truststore" -storepass ${storepassword} | grep Alias | cut -d
" " -f3- | while read alias
do
expiry=`keytool -list -v -keystore "$truststore" -storepass ${storepassword} -alias
"${alias}" | grep Valid | perl -ne 'if(/until: (.*)\n/) { print "$1\n"; }'`'
echo " Certificate ${alias} expires in '$expiry'"
done
```

### Sample script for importing certificates on macOS

The following is a sample shell script that imports the certificate bundle into a trust store on macOS.

```
mydir=tmp/certs
if [! -e "${mydir}"]
then
mkdir -p "${mydir}"
fi
```

```
truststore=${mydir}/rds-truststore.jks
storepassword=changeit

curl -sS "https://s3.amazonaws.com/rds-downloads/rds-combined-ca-bundle.pem" > ${mydir}/
rds-combined-ca-bundle.pem
split -p "-----BEGIN CERTIFICATE-----" ${mydir}/rds-combined-ca-bundle.pem rds-ca-
for CERT in rds-ca-*; do
 alias=$(openssl x509 -noout -text -in $CERT | perl -ne 'next unless /Subject:/; s/.*(CN=|CN =)//; print')
 echo "Importing $alias"
 keytool -import -file ${CERT} -alias "${alias}" -storepass ${storepassword} -keystore
${truststore} -noprompt
 rm ${CERT}
done

rm ${mydir}/rds-combined-ca-bundle.pem

echo "Trust store content is: "

keytool -list -v -keystore "$truststore" -storepass ${storepassword} | grep Alias | cut -d
" " -f3- | while read alias
do
 expiry=`keytool -list -v -keystore "$truststore" -storepass ${storepassword} -alias
"${alias}" | grep Valid | perl -ne 'if(/until: (.*)\n/) { print "$1\n"; }'`"
 echo " Certificate ${alias} expires in '$expiry'"
done
```

## Internetwork traffic privacy

Connections are protected both between Amazon RDS and on-premises applications and between Amazon RDS and other AWS resources within the same AWS Region.

## Traffic between service and on-premises clients and applications

You have two connectivity options between your private network and AWS:

- An AWS Site-to-Site VPN connection. For more information, see [What is AWS Site-to-Site VPN?](#)
- An AWS Direct Connect connection. For more information, see [What is AWS Direct Connect?](#)

You get access to Amazon RDS through the network by using AWS-published API operations. Clients must support Transport Layer Security (TLS) 1.0. We recommend TLS 1.2. Clients must also support cipher suites with Perfect Forward Secrecy (PFS), such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Diffie-Hellman Ephemeral (ECDHE). Most modern systems such as Java 7 and later support these modes. Additionally, you must sign requests using an access key identifier and a secret access key that are associated with an IAM principal. Or you can use the [AWS security token service \(STS\)](#) to generate temporary security credentials to sign requests.

# Identity and access management in Amazon RDS

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Amazon RDS resources. IAM is an AWS service that you can use with no additional charge.

## Topics

- [Audience \(p. 1682\)](#)
- [Authenticating with identities \(p. 1682\)](#)
- [Managing access using policies \(p. 1684\)](#)
- [How Amazon RDS works with IAM \(p. 1686\)](#)
- [Amazon RDS identity-based policy examples \(p. 1688\)](#)
- [IAM database authentication for MySQL and PostgreSQL \(p. 1698\)](#)
- [Troubleshooting Amazon RDS identity and access \(p. 1727\)](#)

## Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work you do in Amazon RDS.

**Service user** – If you use the Amazon RDS service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more Amazon RDS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in Amazon RDS, see [Troubleshooting Amazon RDS identity and access \(p. 1727\)](#).

**Service administrator** – If you're in charge of Amazon RDS resources at your company, you probably have full access to Amazon RDS. It's your job to determine which Amazon RDS features and resources your employees should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with Amazon RDS, see [How Amazon RDS works with IAM \(p. 1686\)](#).

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to Amazon RDS. To view example Amazon RDS identity-based policies that you can use in IAM, see [Amazon RDS identity-based policy examples \(p. 1688\)](#).

## Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. For more information about signing in using the AWS Management Console, see [The IAM console and sign-in page](#) in the *IAM User Guide*.

You must be *authenticated* (signed in to AWS) as the AWS account root user, an IAM user, or by assuming an IAM role. You can also use your company's single sign-on authentication, or even sign in using Google or Facebook. In these cases, your administrator previously set up identity federation using IAM roles. When you access AWS using credentials from another company, you are assuming a role indirectly.

To sign in directly to the [AWS Management Console](#), use your password with your root user email or your IAM user name. You can access AWS programmatically using your root user or IAM user access keys. AWS provides SDK and command line tools to cryptographically sign your request using your credentials. If you don't use AWS tools, you must sign the request yourself. Do this using *Signature Version 4*, a protocol

for authenticating inbound API requests. For more information about authenticating requests, see [Signature Version 4 signing process](#) in the *AWS General Reference*.

Regardless of the authentication method that you use, you might also be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *IAM User Guide*.

## AWS account root user

When you first create an AWS account, you begin with a single sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the *AWS account root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks, even the administrative ones. Instead, adhere to the [best practice of using the root user only to create your first IAM user](#). Then securely lock away the root user credentials and use them to perform only a few account and service management tasks.

## IAM users and groups

An *IAM user* is an identity within your AWS account that has specific permissions for a single person or application. An IAM user can have long-term credentials such as a user name and password or a set of access keys. To learn how to generate access keys, see [Managing access keys for IAM users](#) in the *IAM User Guide*. When you generate access keys for an IAM user, make sure you view and securely save the key pair. You cannot recover the secret access key in the future. Instead, you must generate a new access key pair.

An *IAM group* is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see [When to create an IAM user \(instead of a role\)](#) in the *IAM User Guide*.

You can authenticate to your DB instance using IAM database authentication.

IAM database authentication works with the following DB engines:

- Amazon RDS for MySQL
- Amazon RDS for PostgreSQL

For more information about authenticating to your DB instance using IAM, see [IAM database authentication for MySQL and PostgreSQL \(p. 1698\)](#).

## IAM roles

An *IAM role* is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by [switching roles](#). You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see [Using IAM roles](#) in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Temporary IAM user permissions** – An IAM user can assume an IAM role to temporarily take on different permissions for a specific task.
- **Federated user access** – Instead of creating an IAM user, you can use existing identities from AWS Directory Service, your enterprise user directory, or a web identity provider. These are known as *federated users*. AWS assigns a role to a federated user when access is requested through an [identity provider](#). For more information about federated users, see [Federated users and roles](#) in the *IAM User Guide*.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see [How IAM roles differ from resource-based policies](#) in the *IAM User Guide*.
- **AWS service access** – A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. Service roles provide access only within your account and cannot be used to grant access to services in other accounts. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *IAM User Guide*.

To learn whether to use IAM roles, see [When to create an IAM role \(instead of a user\)](#) in the *IAM User Guide*.

## Managing access using policies

You control access in AWS by creating policies and attaching them to IAM identities or AWS resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when an entity (root user, IAM user, or IAM role) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see [Overview of JSON policies](#) in the *IAM User Guide*.

An IAM administrator can use policies to specify who has access to AWS resources, and what actions they can perform on those resources. Every IAM entity (user or role) starts with no permissions. In other words, by default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

## Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, role, or group. These policies control what actions that identity can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](#) in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](#) in the *IAM User Guide*.

The following AWS managed policies, which you can attach to users in your account, are specific to Amazon RDS:

- **AmazonRDSReadOnlyAccess** – Grants read-only access to all Amazon RDS resources for the AWS account specified.
- **AmazonRDSFullAccess** – Grants full access to all Amazon RDS resources for the AWS account specified.

## Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](#) in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see [How SCPs work](#) in the *AWS Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see [Session policies](#) in the *IAM User Guide*.

## Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](#) in the *IAM User Guide*.

For more information about identity and access management for Amazon RDS, continue to the following pages:

- [How Amazon RDS works with IAM \(p. 1686\)](#)
- [Troubleshooting Amazon RDS identity and access \(p. 1727\)](#)

## How Amazon RDS works with IAM

Before you use IAM to manage access to Amazon RDS, you should understand what IAM features are available to use with Amazon RDS. To get a high-level view of how Amazon RDS and other AWS services work with IAM, see [AWS services that work with IAM](#) in the *IAM User Guide*.

### Topics

- [Amazon RDS identity-based policies \(p. 1686\)](#)
- [Amazon RDS resource-based policies \(p. 1688\)](#)
- [Authorization based on Amazon RDS tags \(p. 1688\)](#)
- [Amazon RDS IAM roles \(p. 1688\)](#)

## Amazon RDS identity-based policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. Amazon RDS supports specific actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see [IAM JSON policy elements reference](#) in the *IAM User Guide*.

### Actions

The `Action` element of an IAM identity-based policy describes the specific action or actions that will be allowed or denied by the policy. Policy actions usually have the same name as the associated AWS API operation. The action is used in a policy to grant permissions to perform the associated operation.

Policy actions in Amazon RDS use the following prefix before the action: `rds:`. For example, to grant someone permission to describe DB instances with the Amazon RDS `DescribeDBInstances` API operation, you include the `rds:DescribeDBInstances` action in their policy. Policy statements must include either an `Action` or `NotAction` element. Amazon RDS defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [
 "rds:action1",
 "rds:action2"]
```

You can specify multiple actions using wildcards (\*). For example, to specify all actions that begin with the word `Describe`, include the following action:

```
"Action": "rds:Describe*"
```

To see a list of Amazon RDS actions, see [Actions Defined by Amazon RDS](#) in the *Service Authorization Reference*.

### Resources

The `Resource` element specifies the object or objects to which the action applies. Statements must include either a `Resource` or a `NotResource` element. You specify a resource using an ARN or using the wildcard (\*) to indicate that the statement applies to all resources.

The DB instance resource has the following ARN:

```
arn:${Partition}:rds:${Region}:${Account}:{ResourceType}/${Resource}
```

For more information about the format of ARNs, see [Amazon Resource Names \(ARNs\) and AWS service namespaces](#).

For example, to specify the dbtest DB instance in your statement, use the following ARN:

```
"Resource": "arn:aws:rds:us-west-2:123456789012:db:dbtest"
```

To specify all DB instances that belong to a specific account, use the wildcard (\*):

```
"Resource": "arn:aws:rds:us-east-1:123456789012:db:/*"
```

Some RDS API operations, such as those for creating resources, cannot be performed on a specific resource. In those cases, you must use the wildcard (\*).

```
"Resource": "*"
```

Many Amazon RDS API operations involve multiple resources. For example, `CreateDBInstance` creates a DB instance. You can specify that an IAM user must use a specific security group and parameter group when creating a DB instance. To specify multiple resources in a single statement, separate the ARNs with commas.

```
"Resource": [
 "resource1",
 "resource2"]
```

To see a list of Amazon RDS resource types and their ARNs, see [Resources Defined by Amazon RDS](#) in the *Service Authorization Reference*. To learn with which actions you can specify the ARN of each resource, see [Actions Defined by Amazon RDS](#).

## Condition keys

The `Condition` element (or `Condition block`) lets you specify conditions in which a statement is in effect. The `Condition` element is optional. You can build conditional expressions that use [condition operators](#), such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple `Condition` elements in a statement, or multiple keys in a single `Condition` element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see [IAM policy elements: Variables and tags](#) in the *IAM User Guide*.

Amazon RDS defines its own set of condition keys and also supports using some global condition keys. To see all AWS global condition keys, see [AWS global condition context keys](#) in the *IAM User Guide*.

All RDS API operations support the `aws:RequestedRegion` condition key.

To see a list of Amazon RDS condition keys, see [Condition Keys for Amazon RDS](#) in the *Service Authorization Reference*. To learn with which actions and resources you can use a condition key, see [Actions Defined by Amazon RDS](#).

## Examples

To view examples of Amazon RDS identity-based policies, see [Amazon RDS identity-based policy examples \(p. 1688\)](#).

## Amazon RDS resource-based policies

Amazon RDS does not support resource-based policies.

## Authorization based on Amazon RDS tags

You can attach tags to Amazon RDS resources or pass tags in a request to Amazon RDS. To control access based on tags, you provide tag information in the [condition element](#) of a policy using the `rds:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys. For more information about tagging Amazon RDS resources, see [Specifying conditions: Using custom tags \(p. 1695\)](#).

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see [Grant permission for actions on a resource with a specific tag with two different values \(p. 1693\)](#).

## Amazon RDS IAM roles

An [IAM role](#) is an entity within your AWS account that has specific permissions.

### Using temporary credentials with Amazon RDS

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as [AssumeRole](#) or [GetFederationToken](#).

Amazon RDS supports using temporary credentials.

### Service-linked roles

[Service-linked roles](#) allow AWS services to access resources in other services to complete an action on your behalf. Service-linked roles appear in the Roles list in the IAM Management Console and are owned by the service. An IAM administrator can view but not edit the permissions for service-linked roles.

Amazon RDS supports service-linked roles. For details about creating or managing Amazon RDS service-linked roles, see [Using service-linked roles for Amazon RDS \(p. 1752\)](#).

### Service roles

This feature allows a service to assume a [service role](#) on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in the Roles list in the IAM Management Console and are owned by your account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

Amazon RDS supports service roles.

## Amazon RDS identity-based policy examples

By default, IAM users and roles don't have permission to create or modify Amazon RDS resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM

administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see [Creating policies on the JSON tab](#) in the *IAM User Guide*.

## Policy best practices

Identity-based policies are very powerful. They determine whether someone can create, access, or delete Amazon RDS resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get Started Using AWS Managed Policies** – To start using Amazon RDS quickly, use AWS managed policies to give your employees the permissions they need. These policies are already available in your account and are maintained and updated by AWS. For more information, see [Get started using permissions with AWS managed policies](#) in the *IAM User Guide*.
- **Grant Least Privilege** – When you create custom policies, grant only the permissions required to perform a task. Start with a minimum set of permissions and grant additional permissions as necessary. Doing so is more secure than starting with permissions that are too lenient and then trying to tighten them later. For more information, see [Grant least privilege](#) in the *IAM User Guide*.
- **Enable MFA for Sensitive Operations** – For extra security, require IAM users to use multi-factor authentication (MFA) to access sensitive resources or API operations. For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *IAM User Guide*.
- **Use Policy Conditions for Extra Security** – To the extent that it's practical, define the conditions under which your identity-based policies allow access to a resource. For example, you can write conditions to specify a range of allowable IP addresses that a request must come from. You can also write conditions to allow requests only within a specified date or time range, or to require the use of SSL or MFA. For more information, see [IAM JSON policy elements: Condition](#) in the *IAM User Guide*.

## Using the Amazon RDS console

To access the Amazon RDS console, you must have a minimum set of permissions. These permissions must enable you to list and view details about the Amazon RDS resources in your AWS account. You can

create an identity-based policy that is more restrictive than the minimum required permissions. However, if you do, the console doesn't function as intended for entities (IAM users or roles) with that policy.

To ensure that those entities can still use the Amazon RDS console, also attach the following AWS managed policy to the entities. For more information, see [Adding permissions to a user](#) in the *IAM User Guide*.

AmazonRDSReadOnlyAccess

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

## Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "ViewOwnUserInfo",
 "Effect": "Allow",
 "Action": [
 "iam:GetUserPolicy",
 "iam>ListGroupsForUser",
 "iam>ListAttachedUserPolicies",
 "iam>ListUserPolicies",
 "iam:GetUser"
],
 "Resource": [
 "arn:aws:iam::*:user/${aws:username}"
]
 },
 {
 "Sid": "NavigateInConsole",
 "Effect": "Allow",
 "Action": [
 "iam:GetGroupPolicy",
 "iam:GetPolicyVersion",
 "iam:GetPolicy",
 "iam>ListAttachedGroupPolicies",
 "iam>ListGroupPolicies",
 "iam>ListPolicyVersions",
 "iam>ListPolicies",
 "iam>ListUsers"
],
 "Resource": "*"
 }
]
}
```

## Allow a user to create DB instances in an AWS account

The following is an example policy that allows the user with the ID 123456789012 to create DB instances for your AWS account. The policy requires that the name of the new DB instance begin with `test`. The new DB instance must also use the MySQL database engine and the `db.t2.micro` DB

instance class. In addition, the new DB instance must use an option group and a DB parameter group that starts with `default`, and it must use the `default` subnet group.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowCreateDBInstanceOnly",
 "Effect": "Allow",
 "Action": [
 "rds:CreateDBInstance"
],
 "Resource": [
 "arn:aws:rds:*:123456789012:db:test*",
 "arn:aws:rds:*:123456789012:og:default*",
 "arn:aws:rds:*:123456789012:pg:default*",
 "arn:aws:rds:*:123456789012:subgrp:default"
],
 "Condition": {
 "StringEquals": {
 "rds:DatabaseEngine": "mysql",
 "rds:DatabaseClass": "db.t2.micro"
 }
 }
 }
]
}
```

The policy includes a single statement that specifies the following permissions for the IAM user:

- The policy allows the IAM user to create a DB instance using the [CreateDBInstance](#) API operation (this also applies to the `create-db-instance` AWS CLI command and the AWS Management Console).
- The `Resource` element specifies that the user can perform actions on or with resources. You specify resources using an Amazon Resources Name (ARN). This ARN includes the name of the service that the resource belongs to (`rds`), the AWS Region (\* indicates any region in this example), the user account number (123456789012 is the user ID in this example), and the type of resource. For more information about creating ARNs, see [Working with Amazon Resource Names \(ARNs\) in Amazon RDS \(p. 311\)](#).

The `Resource` element in the example specifies the following policy constraints on resources for the user:

- The DB instance identifier for the new DB instance must begin with `test` (for example, `testCustomerData1`, `test-region2-data`).
- The option group for the new DB instance must begin with `default`.
- The DB parameter group for the new DB instance must begin with `default`.
- The subnet group for the new DB instance must be the `default` subnet group.
- The `Condition` element specifies that the DB engine must be MySQL and the DB instance class must be `db.t2.micro`. The `Condition` element specifies the conditions when a policy should take effect. You can add additional permissions or restrictions by using the `Condition` element. For more information about specifying conditions, see [Condition keys \(p. 1687\)](#). This example specifies the `rds:DatabaseEngine` and `rds:DatabaseClass` conditions. For information about the valid condition values for `rds:DatabaseEngine`, see the list under the `Engine` parameter in [CreateDBInstance](#). For information about the valid condition values for `rds:DatabaseClass`, see [Supported DB engines for DB instance classes \(p. 8\)](#).

The policy doesn't specify the `Principal` element because in an identity-based policy you don't specify the principal who gets the permission. When you attach policy to a user, the user is the implicit principal.

When you attach a permission policy to an IAM role, the principal identified in the role's trust policy gets the permissions.

To see a list of Amazon RDS actions, see [Actions Defined by Amazon RDS in the Service Authorization Reference](#).

## Permissions required to use the console

For a user to work with the console, that user must have a minimum set of permissions. These permissions allow the user to describe the Amazon RDS resources for their AWS account and to provide other related information, including Amazon EC2 security and network information.

If you create an IAM policy that is more restrictive than the minimum required permissions, the console doesn't function as intended for users with that IAM policy. To ensure that those users can still use the console, also attach the `AmazonRDSReadOnlyAccess` managed policy to the user, as described in [Managing access using policies \(p. 1684\)](#).

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the Amazon RDS API.

The following policy grants full access to all Amazon RDS resources for the root AWS account:

```
AmazonRDSFullAccess
```

## Allow a user to perform any describe action on any RDS resource

The following permissions policy grants permissions to a user to run all of the actions that begin with `Describe`. These actions show information about an RDS resource, such as a DB instance. The wildcard character (\*) in the `Resource` element indicates that the actions are allowed for all Amazon RDS resources owned by the account.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowRDSDescribe",
 "Effect": "Allow",
 "Action": "rds:Describe*",
 "Resource": "*"
 }
]
}
```

## Allow a user to create a DB instance that uses the specified DB parameter group and subnet group

The following permissions policy grants permissions to allow a user to only create a DB instance that must use the `mydbpg` DB parameter group and the `mydbsubnetgroup` DB subnet group.

```
{
 "Version": "2012-10-17",
 "Statement": [
```

```
{
 "Sid": "VisualEditor0",
 "Effect": "Allow",
 "Action": "rds:CreateDBInstance",
 "Resource": [
 "arn:aws:rds:*:pg:mydbpg",
 "arn:aws:rds:*:subgrp:mydbsubnetgroup"
]
}
}
}
```

## Grant permission for actions on a resource with a specific tag with two different values

You can use conditions in your identity-based policy to control access to Amazon RDS resources based on tags. The following policy allows permission to perform the `ModifyDBInstance` and `CreateDBSnapshot` APIs on DB instances with either the `stage` tag set to `development` or `test`.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowDevTestCreate",
 "Effect": "Allow",
 "Action": [
 "rds:ModifyDBInstance",
 "rds:CreateDBSnapshot"
],
 "Resource": "*",
 "Condition": {
 "StringEquals": {
 "rds:db-tag/stage": [
 "development",
 "test"
]
 }
 }
 }
]
}
```

## Prevent a user from deleting a DB instance

The following permissions policy grants permissions to prevent a user from deleting a specific DB instance. For example, you might want to deny the ability to delete your production DB instances to any user that is not an administrator.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "DenyDelete1",
 "Effect": "Deny",
 "Action": "rds:DeleteDBInstance",
 "Resource": "arn:aws:rds:us-west-2:123456789012:db:my-mysql-instance"
 }
]
}
```

## Deny all access to a resource

You can explicitly deny access to a resource. Deny policies take precedence over allow policies. The following policy explicitly denies a user the ability to manage a resource:

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Deny",
 "Action": "rds:*",
 "Resource": "arn:aws:rds:us-east-1:123456789012:db:mydb"
 }
]
}
```

## Example policies: Using condition keys

Following are examples of how you can use condition keys in Amazon RDS IAM permissions policies.

### Example 1: Grant permission to create a DB instance that uses a specific DB engine and isn't MultiAZ

The following policy uses an RDS condition key and allows a user to create only DB instances that use the MySQL database engine and don't use MultiAZ. The Condition element indicates the requirement that the database engine is MySQL.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowMySQLCreate",
 "Effect": "Allow",
 "Action": "rds:CreateDBInstance",
 "Resource": "*",
 "Condition": {
 "StringEquals": {
 "rds:DatabaseEngine": "mysql"
 },
 "Bool": {
 "rds:MultiAz": false
 }
 }
 }
]
}
```

### Example 2: Explicitly deny permission to create DB instances for certain DB instance classes and create DB instances that use Provisioned IOPS

The following policy explicitly denies permission to create DB instances that use the DB instance classes `r3.8xlarge` and `m4.10xlarge`, which are the largest and most expensive DB instance classes. This policy also prevents users from creating DB instances that use Provisioned IOPS, which incurs an additional cost.

Explicitly denying permission supersedes any other permissions granted. This ensures that identities to not accidentally get permission that you never want to grant.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "DenyLargeCreate",
 "Effect": "Deny",
 "Action": "rds:CreateDBInstance",
 "Resource": "*",
 "Condition": {
 "StringEquals": {
 "rds:DatabaseClass": [
 "db.r3.8xlarge",
 "db.m4.10xlarge"
]
 }
 }
 },
 {
 "Sid": "DenyPIOPSCreate",
 "Effect": "Deny",
 "Action": "rds:CreateDBInstance",
 "Resource": "*",
 "Condition": {
 "NumericNotEquals": {
 "rds:Piops": "0"
 }
 }
 }
]
}
```

### Example 3: Limit the set of tag keys and values that can be used to tag a resource

The following policy uses an RDS condition key and allows the addition of a tag with the key `stage` to be added to a resource with the values `test`, `qa`, and `production`.

```
{
 {
 "Version" : "2012-10-17",
 "Statement" : [
 {
 "Effect" : "Allow",
 "Action" : ["rds:AddTagsToResource", "rds:RemoveTagsFromResource"],
 "Resource" : "*",
 "Condition" : { "streq" : { "rds:req-tag/stage" : ["test", "qa", "production"] } }
 }
]
 }
}
```

## Specifying conditions: Using custom tags

Amazon RDS supports specifying conditions in an IAM policy using custom tags.

For example, suppose that you add a tag named `environment` to your DB instances with values such as `beta`, `staging`, `production`, and so on. If you do, you can create a policy that restricts certain users to DB instances based on the `environment` tag value.

**Note**

Custom tag identifiers are case-sensitive.

The following table lists the RDS tag identifiers that you can use in a Condition element.

RDS tag identifier	Applies to
db-tag	DB instances, including read replicas
snapshot-tag	DB snapshots
ri-tag	Reserved DB instances
secgrp-tag	DB security groups
og-tag	DB option groups
pg-tag	DB parameter groups
subgrp-tag	DB subnet groups
es-tag	Event subscriptions
cluster-tag	DB clusters
cluster-pg-tag	DB cluster parameter groups
cluster-snapshot-tag	DB cluster snapshots

The syntax for a custom tag condition is as follows:

```
"Condition": {"StringEquals": {"rds:rds-tag-identifier/tag-name": ["value"]}} }
```

For example, the following Condition element applies to DB instances with a tag named environment and a tag value of production.

```
"Condition": {"StringEquals": {"rds:db-tag/environment": ["production"]}} }
```

For information about creating tags, see [Tagging Amazon RDS resources \(p. 301\)](#).

**Important**

If you manage access to your RDS resources using tagging, we recommend that you secure access to the tags for your RDS resources. You can manage access to tags by creating policies for the AddTagsToResource and RemoveTagsFromResource actions. For example, the following policy denies users the ability to add or remove tags for all resources. You can then create policies to allow specific users to add or remove tags.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "DenyTagUpdates",
 "Effect": "Deny",
 "Action": [
 "rds:AddTagsToResource",
 "rds:RemoveTagsFromResource"
],
 "Resource": "*"
 }
]
}
```

}

To see a list of Amazon RDS actions, see [Actions Defined by Amazon RDS in the Service Authorization Reference](#).

## Example policies: Using custom tags

Following are examples of how you can use custom tags in Amazon RDS IAM permissions policies. For more information about adding tags to an Amazon RDS resource, see [Working with Amazon Resource Names \(ARNs\) in Amazon RDS \(p. 311\)](#).

### Note

All examples use the us-west-2 region and contain fictitious account IDs.

### Example 1: Grant permission for actions on a resource with a specific tag with two different values

The following policy allows permission to perform the `ModifyDBInstance` and `CreateDBSnapshot` APIs on DB instances with either the `stage` tag set to `development` or `test`.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowDevTestCreate",
 "Effect": "Allow",
 "Action": [
 "rds:ModifyDBInstance",
 "rds:CreateDBSnapshot"
],
 "Resource": "*",
 "Condition": {
 "StringEquals": {
 "rds:db-tag/stage": [
 "development",
 "test"
]
 }
 }
 }
]
}
```

### Example 2: Explicitly deny permission to create a DB instance that uses specified DB parameter groups

The following policy explicitly denies permission to create a DB instance that uses DB parameter groups with specific tag values. You might apply this policy if you require that a specific customer-created DB parameter group always be used when creating DB instances. Policies that use `Deny` are most often used to restrict access that was granted by a broader policy.

Explicitly denying permission supersedes any other permissions granted. This ensures that identities to not accidentally get permission that you never want to grant.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "DenyProductionCreate",
 "Effect": "Deny",
 "Action": "rds:CreateDBInstance",
 "Resource": "*"
 }
]
}
```

```
 "Resource": "*",
 "Condition": {
 "StringEquals": {
 "rds:pg-tag/usage": "prod"
 }
 }
]
}
```

**Example 3: Grant permission for actions on a DB instance with an instance name that is prefixed with a user name**

The following policy allows permission to call any API (except to `AddTagsToResource` or `RemoveTagsFromResource`) on a DB instance that has a DB instance name that is prefixed with the user's name and that has a tag called `stage` equal to `devo` or that has no tag called `stage`.

The Resource line in the policy identifies a resource by its Amazon Resource Name (ARN). For more information about using ARNs with Amazon RDS resources, see [Working with Amazon Resource Names \(ARNs\) in Amazon RDS \(p. 311\)](#).

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Sid": "AllowFullDevAccessNoTags",
 "Effect": "Allow",
 "NotAction": [
 "rds:AddTagsToResource",
 "rds:RemoveTagsFromResource"
],
 "Resource": "arn:aws:rds:*:123456789012:db:${aws:username}*",
 "Condition": {
 "StringEqualsIfExists": {
 "rds:db-tag/stage": "devo"
 }
 }
]
]
}
```

## IAM database authentication for MySQL and PostgreSQL

You can authenticate to your DB instance using AWS Identity and Access Management (IAM) database authentication. IAM database authentication works with MySQL and PostgreSQL. With this authentication method, you don't need to use a password when you connect to a DB instance. Instead, you use an authentication token.

An *authentication token* is a unique string of characters that Amazon RDS generates on request. Authentication tokens are generated using AWS Signature Version 4. Each token has a lifetime of 15 minutes. You don't need to store user credentials in the database, because authentication is managed externally using IAM. You can also still use standard database authentication.

IAM database authentication provides the following benefits:

- Network traffic to and from the database is encrypted using Secure Socket Layer (SSL) or Transport Layer Security (TLS). For more information about using SSL/TLS with Amazon RDS, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

- You can use IAM to centrally manage access to your database resources, instead of managing access individually on each DB instance.
- For applications running on Amazon EC2, you can use profile credentials specific to your EC2 instance to access your database instead of a password, for greater security.

#### Topics

- [Availability for IAM database authentication \(p. 1699\)](#)
- [Limitations for IAM database authentication \(p. 1699\)](#)
- [MySQL recommendations for IAM database authentication \(p. 1699\)](#)
- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)
- [Connecting to your DB instance using IAM authentication \(p. 1706\)](#)

## Availability for IAM database authentication

IAM database authentication is available for the following database engines:

- MySQL 8.0, minor version 8.0.16 or higher
- MySQL 5.7, minor version 5.7.16 or higher
- MySQL 5.6, minor version 5.6.34 or higher
- PostgreSQL 13, all minor versions
- PostgreSQL 12, all minor versions
- PostgreSQL 11, all minor versions
- PostgreSQL 10, minor version 10.6 or higher
- PostgreSQL 9.6, minor version 9.6.11 or higher
- PostgreSQL 9.5, minor version 9.5.15 or higher

## Limitations for IAM database authentication

When using IAM database authentication, the following limitations apply:

- The maximum number of connections per second for your DB instance might be limited depending on its DB instance class and your workload.
- Currently, IAM database authentication doesn't support all global condition context keys.

For more information about global condition context keys, see [AWS global condition context keys](#) in the *IAM User Guide*.

- Currently, IAM database authentication isn't supported for CNAMEs.
- For PostgreSQL, if the IAM role (`rds_iam`) is added to the master user, IAM authentication takes precedence over Password authentication so the master user has to log in as an IAM user.

## MySQL recommendations for IAM database authentication

We recommend the following when using the MySQL DB engine:

- Use IAM database authentication as a mechanism for temporary, personal access to databases.
- Use IAM database authentication only for workloads that can be easily retried.

- Use IAM database authentication when your application requires fewer than 200 new IAM database authentication connections per second.

The database engines that work with Amazon RDS don't impose any limits on authentication attempts per second. However, when you use IAM database authentication, your application must generate an authentication token. Your application then uses that token to connect to the DB instance. If you exceed the limit of maximum new connections per second, then the extra overhead of IAM database authentication can cause connection throttling. The extra overhead can cause even existing connections to drop. For information about the maximum total connections for MySQL, see [Maximum MySQL and MariaDB connections \(p. 1790\)](#).

**Note**

These recommendations don't apply to Amazon RDS for PostgreSQL DB instances.

## Enabling and disabling IAM database authentication

By default, IAM database authentication is disabled on DB instances. You can enable or disable IAM database authentication using the AWS Management Console, AWS CLI, or the API.

You can enable IAM database authentication when you perform one of the following actions:

- To create a new DB instance with IAM database authentication enabled, see [Creating an Amazon RDS DB instance \(p. 140\)](#).
- To modify a DB instance to enable IAM database authentication, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- To restore a DB instance from a snapshot with IAM database authentication enabled, see [Restoring from a DB snapshot \(p. 352\)](#).
- To restore a DB instance to a point in time with IAM database authentication enabled, see [Restoring a DB instance to a specified time \(p. 392\)](#).

IAM authentication for PostgreSQL DB instances requires that the SSL value be 1. You can't enable IAM authentication for a PostgreSQL DB instance if the SSL value is 0. You can't change the SSL value to 0 if IAM authentication is enabled for a PostgreSQL DB instance.

### Console

Each creation or modification workflow has a **Database authentication** section, where you can enable or disable IAM database authentication. In that section, choose **Password and IAM database authentication** to enable IAM database authentication.

### To enable or disable IAM database authentication for an existing DB instance

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.
3. Choose the DB instance that you want to modify.

**Note**

Make sure that the DB instance is compatible with IAM authentication. Check the compatibility requirements in [Availability for IAM database authentication \(p. 1699\)](#).

4. Choose **Modify**.
5. In the **Database authentication** section, choose **Password and IAM database authentication** to enable IAM database authentication.
6. Choose **Continue**.
7. To apply the changes immediately, choose **Immediately** in the **Scheduling of modifications** section.

## 8. Choose **Modify DB instance** .

### AWS CLI

To create a new DB instance with IAM authentication by using the AWS CLI, use the [create-db-instance](#) command. Specify the `--enable-iam-database-authentication` option, as shown in the following example.

```
aws rds create-db-instance \
 --db-instance-identifier mydbinstance \
 --db-instance-class db.m3.medium \
 --engine MySQL \
 --allocated-storage 20 \
 --master-username masterawsuser \
 --master-user-password masteruserpassword \
 --enable-iam-database-authentication
```

To update an existing DB instance to have or not have IAM authentication, use the AWS CLI command [modify-db-instance](#). Specify either the `--enable-iam-database-authentication` or `--no-enable-iam-database-authentication` option, as appropriate.

#### Note

Make sure that the DB instance is compatible with IAM authentication. Check the compatibility requirements in [Availability for IAM database authentication \(p. 1699\)](#).

By default, Amazon RDS performs the modification during the next maintenance window. If you want to override this and enable IAM DB authentication as soon as possible, use the `--apply-immediately` parameter.

The following example shows how to immediately enable IAM authentication for an existing DB instance.

```
aws rds modify-db-instance \
 --db-instance-identifier mydbinstance \
 --apply-immediately \
 --enable-iam-database-authentication
```

If you are restoring a DB instance, use one of the following AWS CLI commands:

- [restore-db-instance-to-point-in-time](#)
- [restore-db-instance-from-db-snapshot](#)

The IAM database authentication setting defaults to that of the source snapshot. To change this setting, set the `--enable-iam-database-authentication` or `--no-enable-iam-database-authentication` option, as appropriate.

### RDS API

To create a new DB instance with IAM authentication by using the API, use the API operation [CreateDBInstance](#). Set the `EnableIAMDatabaseAuthentication` parameter to `true`.

To update an existing DB instance to have IAM authentication, use the API operation [ModifyDBInstance](#). Set the `EnableIAMDatabaseAuthentication` parameter to `true` to enable IAM authentication, or `false` to disable it.

#### Note

Make sure that the DB instance is compatible with IAM authentication. Check the compatibility requirements in [Availability for IAM database authentication \(p. 1699\)](#).

If you are restoring a DB instance, use one of the following API operations:

- [RestoreDBInstanceFromDBSnapshot](#)
- [RestoreDBInstanceToPointInTime](#)

The IAM database authentication setting defaults to that of the source snapshot. To change this setting, set the `EnableIAMDatabaseAuthentication` parameter to `true` to enable IAM authentication, or `false` to disable it.

## Creating and using an IAM policy for IAM database access

To allow an IAM user or role to connect to your DB instance, you must create an IAM policy. After that, you attach the policy to an IAM user or role.

### Note

To learn more about IAM policies, see [Identity and access management in Amazon RDS \(p. 1682\)](#).

The following example policy allows an IAM user to connect to a DB instance using IAM database authentication.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "rds-db:connect"
],
 "Resource": [
 "arn:aws:rds-db:us-east-2:1234567890:dbuser:db-ABCDEFGHIJKLM01234/db_user"
]
 }
]
}
```

### Important

An IAM administrator user can access DB instances without explicit permissions in an IAM policy.

The example in [Create an IAM user \(p. 66\)](#) creates an IAM administrator user. If you want to restrict administrator access to DB instances, you can create an IAM role with the appropriate, lesser privileged permissions and assign it to the administrator.

### Note

Don't confuse the `rds-db:` prefix with other RDS API operation prefixes that begin with `rds:`. You use the `rds-db:` prefix and the `rds-db:connect` action only for IAM database authentication. They aren't valid in any other context.

Currently, the IAM console displays an error for policies with the `rds-db:connect` action. You can ignore this error.

The example policy includes a single statement with the following elements:

- **Effect** – Specify `Allow` to grant access to the DB instance. If you don't explicitly allow access, then access is denied by default.
- **Action** – Specify `rds-db:connect` to allow connections to the DB instance.
- **Resource** – Specify an Amazon Resource Name (ARN) that describes one database account in one DB instance. The ARN format is as follows.

```
arn:aws:rds-db:region:account-id:dbuser:DbiResourceId/db-user-name
```

In this format, replace the following:

- **region** is the AWS Region for the DB instance. In the example policy, the AWS Region is `us-east-2`.
- **account-id** is the AWS account number for the DB instance. In the example policy, the account number is `1234567890`.
- **DbiResourceId** is the identifier for the DB instance. This identifier is unique to an AWS Region and never changes. In the example policy, the identifier is `db-ABCDEFGHIJKL01234`.

To find a DB instance resource ID in the AWS Management Console for Amazon RDS, choose the DB instance to see its details. Then choose the **Configuration** tab. The **Resource ID** is shown in the **Configuration** section.

Alternatively, you can use the AWS CLI command to list the identifiers and resource IDs for all of your DB instance in the current AWS Region, as shown following.

```
aws rds describe-db-instances --query "DBInstances[*].
[DBInstanceIdentifier,DbiResourceId]"
```

#### Note

If you are connecting to a database through RDS Proxy, specify the proxy resource ID, such as `prx-ABCDEFGHIJKL01234`. For information about using IAM database authentication with RDS Proxy, see [Connecting to a proxy using IAM authentication \(p. 184\)](#).

- **db-user-name** is the name of the database account to associate with IAM authentication. In the example policy, the database account is `db_user`.

You can construct other ARNs to support various access patterns. The following policy allows access to two different database accounts in a DB instance.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "rds-db:connect"
],
 "Resource": [
 "arn:aws:rds-db:us-east-2:123456789012:dbuser:db-ABCDEFGHIJKL01234/jane_doe",
 "arn:aws:rds-db:us-east-2:123456789012:dbuser:db-ABCDEFGHIJKL01234/mary_roe"
]
 }
]
}
```

The following policy uses the `"*"` character to match all DB instances and database accounts for a particular AWS account and AWS Region.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "rds-db:connect"
],
 "Resource": [
 "arn:aws:rds-db:us-east-2:1234567890:dbuser:/*/*"
]
 }
]
}
```

The following policy matches all of the DB instances for a particular AWS account and AWS Region. However, the policy only grants access to DB instances that have a `jane_doe` database account.

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "rds-db:connect"
],
 "Resource": [
 "arn:aws:rds-db:us-east-2:123456789012:dbuser:*/jane_doe"
]
 }
]
}
```

The IAM user or role has access to only those databases that the database user does. For example, suppose that your DB instance has a database named `dev`, and another database named `test`. If the database user `jane_doe` has access only to `dev`, any IAM users or roles that access that DB instance with the `jane_doe` user also have access only to `dev`. This access restriction is also true for other database objects, such as tables, views, and so on.

An IAM administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions. For examples of policies, see [Amazon RDS identity-based policy examples \(p. 1688\)](#).

## Attaching an IAM policy to an IAM user or role

After you create an IAM policy to allow database authentication, you need to attach the policy to an IAM user or role. For a tutorial on this topic, see [Create and attach your first customer managed policy](#) in the *IAM User Guide*.

As you work through the tutorial, you can use one of the policy examples shown in this section as a starting point and tailor it to your needs. At the end of the tutorial, you have an IAM user with an attached policy that can make use of the `rds-db:connect` action.

### Note

You can map multiple IAM users or roles to the same database user account. For example, suppose that your IAM policy specified the following resource ARN.

```
arn:aws:rds-db:us-east-2:123456789012:dbuser:db-12ABC34DEFG5HIJ6KLMNOP78QR/jane_doe
```

If you attach the policy to IAM users *Jane*, *Bob*, and *Diego*, then each of those users can connect to the specified DB instance using the `jane_doe` database account.

## Creating a database account using IAM authentication

With IAM database authentication, you don't need to assign database passwords to the user accounts you create. If you remove an IAM user that is mapped to a database account, you should also remove the database account with the `DROP USER` statement.

### Note

The user name used for IAM authentication must match the case of the user name in the database.

### Topics

- [Using IAM authentication with MySQL \(p. 1705\)](#)
- [Using IAM authentication with PostgreSQL \(p. 1705\)](#)

## Using IAM authentication with MySQL

With MySQL, authentication is handled by `AWSAuthenticationPlugin`—an AWS-provided plugin that works seamlessly with IAM to authenticate your IAM users. Connect to the DB instance and issue the `CREATE USER` statement, as shown in the following example.

```
CREATE USER jane_doe IDENTIFIED WITH AWSAuthenticationPlugin AS 'RDS';
```

The `IDENTIFIED WITH` clause allows MySQL to use the `AWSAuthenticationPlugin` to authenticate the database account (`jane_doe`). The `AS 'RDS'` clause refers to the authentication method. Make sure the specified database user name is the same as a resource in the IAM policy for IAM database access. For more information, see [Creating and using an IAM policy for IAM database access \(p. 1702\)](#).

### Note

If you see the following message, it means that the AWS-provided plugin is not available for the current DB instance.

`ERROR 1524 (HY000): Plugin 'AWSAuthenticationPlugin' is not loaded`  
To troubleshoot this error, verify that you are using a supported configuration and that you have enabled IAM database authentication on your DB instance. For more information, see [Availability for IAM database authentication \(p. 1699\)](#) and [Enabling and disabling IAM database authentication \(p. 1700\)](#).

After you create an account using `AWSAuthenticationPlugin`, you manage it in the same way as other database accounts. For example, you can modify account privileges with `GRANT` and `REVOKE` statements, or modify various account attributes with the `ALTER USER` statement.

## Using IAM authentication with PostgreSQL

To use IAM authentication with PostgreSQL, connect to the DB instance, create database users, and then grant them the `rds_iam` role as shown in the following example.

```
CREATE USER db_userx;
GRANT rds_iam TO db_userx;
```

Make sure the specified database user name is the same as a resource in the IAM policy for IAM database access. For more information, see [Creating and using an IAM policy for IAM database access \(p. 1702\)](#).

## Connecting to your DB instance using IAM authentication

With IAM database authentication, you use an authentication token when you connect to your DB instance. An *authentication token* is a string of characters that you use instead of a password. After you generate an authentication token, it's valid for 15 minutes before it expires. If you try to connect using an expired token, the connection request is denied.

Every authentication token must be accompanied by a valid signature, using AWS signature version 4. (For more information, see [Signature Version 4 signing process](#) in the *AWS General Reference*.) The AWS CLI and an AWS SDK, such as the AWS SDK for Java or AWS SDK for Python (Boto3), can automatically sign each token you create.

You can use an authentication token when you connect to Amazon RDS from another AWS service, such as AWS Lambda. By using a token, you can avoid placing a password in your code. Alternatively, you can use an AWS SDK to programmatically create and programmatically sign an authentication token.

After you have a signed IAM authentication token, you can connect to an Amazon RDS DB instance. Following, you can find out how to do this using either a command line tool or an AWS SDK, such as the AWS SDK for Java or AWS SDK for Python (Boto3).

For more information, see the following blog posts:

- [Use IAM authentication to connect with SQL Workbench/J to Aurora MySQL or Amazon RDS for MySQL](#)
- [Using IAM authentication to connect with pgAdmin Amazon Aurora PostgreSQL or Amazon RDS for PostgreSQL](#)

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

### Topics

- [Connecting to your DB instance using IAM authentication from the command line: AWS CLI and mysql client \(p. 1706\)](#)
- [Connecting to your DB instance using IAM authentication from the command line: AWS CLI and psql client \(p. 1708\)](#)

- [Connecting to your DB instance using IAM authentication and the AWS SDK for Python \(Boto3\) \(p. 1725\)](#)

## Connecting to your DB instance using IAM authentication from the command line: AWS CLI and mysql client

You can connect from the command line to an Amazon RDS DB instance with the AWS CLI and `mysql` command line tool as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

**Note**

For information about connecting to your database using SQL Workbench/J with IAM authentication, see the blog post [Use IAM authentication to connect with SQL Workbench/J to Aurora MySQL or Amazon RDS for MySQL](#).

**Topics**

- [Generating an IAM authentication token \(p. 1707\)](#)
- [Connecting to a DB instance \(p. 1707\)](#)

### Generating an IAM authentication token

The following example shows how to get a signed authentication token using the AWS CLI.

```
aws rds generate-db-auth-token \
 --hostname rdsmysql.123456789012.us-west-2.rds.amazonaws.com \
 --port 3306 \
 --region us-west-2 \
 --username jane_doe
```

In the example, the parameters are as follows:

- **--hostname** – The host name of the DB instance that you want to access
- **--port** – The port number used for connecting to your DB instance
- **--region** – The AWS Region where the DB instance is running
- **--username** – The database account that you want to access

The first several characters of the token look like the following.

```
rdsmysql.123456789012.us-west-2.rds.amazonaws.com:3306/?Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Expires=900...
```

### Connecting to a DB instance

The general format for connecting is shown following.

```
mysql --host=hostName --port=portNumber --ssl-ca=[full path]rds-combined-ca-bundle.pem --enable-cleartext-plugin --user=userName --password=authToken
```

The parameters are as follows:

- **--host** – The host name of the DB instance that you want to access
- **--port** – The port number used for connecting to your DB instance
- **--ssl-ca** – The SSL certificate file that contains the public key

For more information, see [Using SSL with a MySQL DB instance \(p. 843\)](#).

For more information, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

- `--enable-cleartext-plugin` – A value that specifies that `AWSAuthenticationPlugin` must be used for this connection

If you are using a MariaDB client, the `--enable-cleartext-plugin` option isn't required.

- `--user` – The database account that you want to access
- `--password` – A signed IAM authentication token

The authentication token consists of several hundred characters. It can be unwieldy on the command line. One way to work around this is to save the token to an environment variable, and then use that variable when you connect. The following example shows one way to perform this workaround.

```
RDSHOST="rdsmysql.123456789012.us-west-2.rds.amazonaws.com"
TOKEN=$(aws rds generate-db-auth-token --hostname $RDSHOST --port 3306 --region us-west-2
--username jane_doe)"

mysql --host=$RDSHOST --port=3306 --ssl-ca=/sample_dir/rds-combined-ca-bundle.pem --enable-
cleartext-plugin --user=jane_doe --password=$TOKEN
```

When you connect using `AWSAuthenticationPlugin`, the connection is secured using SSL. To verify this, type the following at the `mysql>` command prompt.

```
show status like 'Ssl%';
```

The following lines in the output show more details.

```
+-----+-----+
| Variable_name | Value
+-----+-----+
| ... | ...
| Ssl_cipher | AES256-SHA

| ... | ...
| Ssl_version | TLSv1.1

| ... | ...
+-----+
| ... | ...
| ... | ...
+-----+
```

## Connecting to your DB instance using IAM authentication from the command line: AWS CLI and psql client

You can connect from the command line to an Amazon RDS for PostgreSQL DB instance with the AWS CLI and `psql` command line tool as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

### Note

For information about connecting to your database using pgAdmin with IAM authentication, see the blog post [Using IAM authentication to connect with pgAdmin Amazon Aurora PostgreSQL or Amazon RDS for PostgreSQL](#).

### Topics

- [Generating an IAM authentication token \(p. 1709\)](#)
- [Connecting to an Amazon RDS PostgreSQL instance \(p. 1709\)](#)

### Generating an IAM authentication token

The authentication token consists of several hundred characters so it can be unwieldy on the command line. One way to work around this is to save the token to an environment variable, and then use that variable when you connect. The following example shows how to use the AWS CLI to get a signed authentication token using the `generate-db-auth-token` command, and store it in a `PGPASSWORD` environment variable.

```
export RDSHOST="rdspostgres.123456789012.us-west-2.rds.amazonaws.com"
export PGPASSWORD="$(aws rds generate-db-auth-token --hostname $RDSHOST --port 5432 --
region us-west-2 --username jane_doe)"
```

In the example, the parameters to the `generate-db-auth-token` command are as follows:

- `--hostname` – The host name of the DB instance that you want to access
- `--port` – The port number used for connecting to your DB instance
- `--region` – The AWS Region where the DB instance is running
- `--username` – The database account that you want to access

The first several characters of the generated token look like the following.

```
rdspostgres.123456789012.us-west-2.rds.amazonaws.com:5432/?Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Expires=900...
```

### Connecting to an Amazon RDS PostgreSQL instance

The general format for using `psql` to connect is shown following.

```
psql "host=hostName port=portNumber sslmode=verify-full sslrootcert=certificateFile
 dbname=DBName user=userName password=authToken"
```

The parameters are as follows:

- `host` – The host name of the DB instance that you want to access
- `port` – The port number used for connecting to your DB instance
- `sslmode` – The SSL mode to use

When you use `sslmode=verify-full`, the SSL connection verifies the DB instance endpoint against the endpoint in the SSL certificate.

- `sslrootcert` – The SSL certificate file that contains the public key

For more information, see [Using SSL with a PostgreSQL DB instance \(p. 1551\)](#).

For information about downloading the SSL certificate, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).

- `dbname` – The database that you want to access
- `user` – The database account that you want to access
- `password` – A signed IAM authentication token

The following example shows using `psql` to connect. In the example `psql` uses the environment variable `PGPASSWORD` that was set when the token was generated in the previous section.

```
psql "host=$RDSHOST port=5432 sslmode=verify-full sslrootcert=/sample_dir/rds-combined-ca-bundle.pem dbname=DBName user=jane_doe password=$PGPASSWORD"
```

## Connecting to your DB instance using IAM authentication and the AWS SDK for .NET

You can connect to an RDS for MySQL or PostgreSQL for DB instance with the AWS SDK for .NET as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

The following code example shows how to generate an authentication token, and then use it to connect to a DB instance.

To run this code example, you need the [AWS SDK for .NET](#), found on the AWS site. The `AWSSDK.Core` and the `AWSSDK.RDS` packages are required. To connect to a DB instance, use the .NET database connector for the DB engine, such as `MySQLConnector` for MySQL or `Npgsql` for PostgreSQL.

Modify the values of the following variables as needed:

- `server` – The endpoint of the DB instance that you want to access
- `port` – The port number used for connecting to your DB instance
- `user` – The database account that you want to access.

This code connects to a MySQL DB instance.

```
using System;
using System.Data;
using MySql.Data;
using MySql.Data.MySqlClient;
using Amazon;

namespace ubuntu
{
 class Program
 {
 static void Main(string[] args)
 {
 var pwd =
 Amazon.RDS.Util.RDSAuthTokenGenerator.GenerateAuthToken(RegionEndpoint.USEast1,
 "mysqladb.123456789012.us-east-1.rds.amazonaws.com", 3306, "jane_doe");
```

```
// for debug only Console.WriteLine("{0}\n", pwd); //this verifies the token is
generated

MySqlConnection conn = new MySqlConnection("server=mysqldb.123456789012.us-
east-1.rds.amazonaws.com;user=jane_doe;database=mydB;port=3306;password={pwd};SslMode=Required;SslCa=..
rds-ca-2019-root.pem");
conn.Open();

// Define a query
MySqlCommand sampleCommand = new MySqlCommand("SHOW DATABASES;", conn);

// Execute a query
MySqlDataReader mysqlDataRdr = sampleCommand.ExecuteReader();

// Read all rows and output the first column in each row
while (mysqlDataRdr.Read())
 Console.WriteLine(mysqlDataRdr[0]);

mysqlDataRdr.Close();
// Close connection
conn.Close();
}

}
```

This code connects to a PostgreSQL DB instance.

```
using System;
using Npgsql;
using Amazon.RDS.Util;

namespace ConsoleApp1
{
 class Program
 {
 static void Main(string[] args)
 {
 var pwd =
 RDSAuthTokenGenerator.GenerateAuthToken("postgresql.123456789012.us-
 east-1.rds.amazonaws.com", 5432, "jane_doe");
 // for debug only Console.WriteLine("{0}\n", pwd); //this verifies the token is generated

 NpgsqlConnection conn = new
 NpgsqlConnection($"Server=postgresql.123456789012.us-east-1.rds.amazonaws.com;User
 Id=jane_doe;Password={pwd};Database=mydb;SSL Mode=Require;Trust Server
 Certificate=true;");
 conn.Open();

 // Define a query
 NpgsqlCommand cmd = new NpgsqlCommand("select count(*) FROM pg_user",
 conn);

 // Execute a query
 NpgsqlDataReader dr = cmd.ExecuteReader();

 // Read all rows and output the first column in each row
 while (dr.Read())
 Console.WriteLine("{0}\n", dr[0]);

 // Close connection
 conn.Close();
 }
 }
}
```

## Connecting to your DB instance using IAM authentication and the AWS SDK for Go

You can connect to an RDS for MySQL or RDS for PostgreSQL DB instance with the AWS SDK for Go as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

To run these code examples, you need the [AWS SDK for Go](#), found on the AWS site.

Modify the values of the following variables as needed:

- `dbName` – The database that you want to access
- `dbUser` – The database account that you want to access
- `dbHost` – The endpoint of the DB instance that you want to access
- `dbPort` – The port number used for connecting to your DB instance
- `region` – The AWS Region where the DB instance is running

In addition, make sure the imported libraries in the sample code exist on your system.

### Important

The examples in this section use the following code to provide credentials that access a database from a local environment:

```
creds := credentials.NewEnvCredentials()
```

If you are accessing a database from an AWS service, such as Amazon EC2 or Amazon ECS, you can replace the code with the following code:

```
sess := session.Must(session.NewSession())
creds := sess.Config.Credentials
```

If you make this change, make sure you add the following import:  
`"github.com/aws/aws-sdk-go/aws/session"`

## Connecting using IAM authentication and the AWS SDK for Go V2

You can connect to a DB instance using IAM authentication and the AWS SDK for Go V2.

### Topics

- [Generating an IAM authentication token \(p. 1712\)](#)
- [Connecting to a DB instance \(p. 1713\)](#)

### Generating an IAM authentication token

The auth package provides utilities for generating authentication tokens for connecting to Amazon RDS MySQL and PostgreSQL database instances. Using the `BuildAuthToken` method, you generate a database authorization token by providing the database endpoint, AWS Region, username, and

a `aws.CredentialProvider` implantation that returns IAM credentials with permission connect to the database using IAM database authentication.

The following example shows how to use `BuildAuthToken` to create an authentication token for connecting to a MySQL DB instance.

```
package main

import "context"
import "github.com/aws/aws-sdk-go-v2/config"
import "github.com/aws/aws-sdk-go-v2/feature/rds/auth"

func main() {

 cfg, err := config.LoadDefaultConfig(context.TODO())
 if err != nil {
 panic("configuration error: " + err.Error())
 }

 authenticationToken, err := auth.BuildAuthToken(
 context.TODO(),
 "mydb.123456789012.us-east-1.rds.amazonaws.com:3306", // Database Endpoint (With Port)
 "us-east-1", // AWS Region
 "jane_doe", // Database Account
 cfg.Credentials,
)
 if err != nil {
 panic("failed to create authentication token: " + err.Error())
 }
}
```

The following example shows how to use `BuildAuthToken` to create an authentication token for connecting to a PostgreSQL DB instance.

```
package main

import "context"
import "github.com/aws/aws-sdk-go-v2/config"
import "github.com/aws/aws-sdk-go-v2/feature/rds/auth"

func main() {

 cfg, err := config.LoadDefaultConfig(context.TODO())
 if err != nil {
 panic("configuration error: " + err.Error())
 }

 authenticationToken, err := auth.BuildAuthToken(
 context.TODO(),
 "mydb.123456789012.us-east-1.rds.amazonaws.com:5432", // Database Endpoint (With Port)
 "us-east-1", // AWS Region
 "jane_doe", // Database Account
 cfg.Credentials,
)
 if err != nil {
 panic("failed to create authentication token: " + err.Error())
 }
}
```

## Connecting to a DB instance

The following code example shows how to generate an authentication token, and then use it to connect to a DB instance.

This code connects to a MySQL DB instance.

```
package main

import "context"
import "github.com/aws/aws-sdk-go-v2/config"
import "github.com/aws/aws-sdk-go-v2/feature/rds/auth"

func main() {

 cfg, err := config.LoadDefaultConfig(context.TODO())
 if err != nil {
 panic("configuration error: " + err.Error())
 }

 authenticationToken, err := auth.BuildAuthToken(
 context.TODO(),
 "mydb.123456789012.us-east-1.rds.amazonaws.com:3306", // Database Endpoint (With Port)
 "us-east-1", // AWS Region
 "jane_doe", // Database Account
 cfg.Credentials,
)
 if err != nil {
 panic("failed to create authentication token: " + err.Error())
 }

 dsn := fmt.Sprintf("%s:%s@tcp(%s)/%s?tls=true&allowCleartextPasswords=true",
 dbUser, authenticationToken, dbEndpoint, dbName,
)

 db, err := sql.Open("mysql", dsn)
 if err != nil {
 panic(err)
 }

 err = db.Ping()
 if err != nil {
 panic(err)
 }
}
```

This code connects to a PostgreSQL DB instance.

```
package main

import "context"
import "github.com/aws/aws-sdk-go-v2/config"
import "github.com/aws/aws-sdk-go-v2/feature/rds/auth"

func main() {

 cfg, err := config.LoadDefaultConfig(context.TODO())
 if err != nil {
 panic("configuration error: " + err.Error())
 }

 authenticationToken, err := auth.BuildAuthToken(
 context.TODO(),
 "mydb.123456789012.us-east-1.rds.amazonaws.com:5432", // Database Endpoint (With Port)
 "us-east-1", // AWS Region
 "jane_doe", // Database Account
 cfg.Credentials,
)
 if err != nil {
```

```
 panic("failed to create authentication token: " + err.Error())
}

dsn := fmt.Sprintf("host=%s port=%d user=%s password=%s dbname=%s",
 dbHost, dbPort, dbUser, authToken, dbName,
)

db, err := sql.Open("postgres", dsn)
if err != nil {
 panic(err)
}

err = db.Ping()
if err != nil {
 panic(err)
}
}
```

## Connecting using IAM authentication and the AWS SDK for Go V1.

You can connect to a DB instance using IAM authentication and the AWS SDK for Go V1

### Topics

- [Generating an IAM authentication token \(p. 1715\)](#)
- [Connecting to a DB instance \(p. 1716\)](#)

### Generating an IAM authentication token

You can use the [rdsutils](#) package to generate tokens used to connect to a DB instance. Call the [BuildAuthToken](#) function to generate a token. Provide the DB instance endpoint, AWS region, username, and IAM credentials to generate the token for connecting to a DB instance with IAM credentials.

The following example shows how to use `BuildAuthToken` to create an authentication token for connecting to a MySQL DB instance.

```
package main

import (
 "database/sql"
 "fmt"
 "log"

 "github.com/aws/aws-sdk-go/aws/credentials"
 "github.com/aws/aws-sdk-go/service/rds/rdsutils"
)

func main() {
 dbName := "app"
 dbUser := "jane_doe"
 dbHost := "mydb.123456789012.us-east-1.rds.amazonaws.com"
 dbPort := 3306
 dbEndpoint := fmt.Sprintf("%s:%d", dbHost, dbPort)
 region := "us-east-1"

 creds := credentials.NewEnvCredentials()
 authToken, err := rdsutils.BuildAuthToken(dbEndpoint, region, dbUser, creds)
 if err != nil {
 log.Fatalf("failed to build auth token %v", err)
 }
}
```

The following example shows how to use `BuildAuthToken` to create an authentication token for connecting to a PostgreSQL DB instance.

```
package main

import (
 "database/sql"
 "fmt"
 "log"

 "github.com/aws/aws-sdk-go/aws/credentials"
 "github.com/aws/aws-sdk-go/service/rds/rdsutils"
)

func main() {
 dbName := "app"
 dbUser := "jane_doe"
 dbHost := "mydb.123456789012.us-east-1.rds.amazonaws.com"
 dbPort := 5432
 dbEndpoint := fmt.Sprintf("%s:%d", dbHost, dbPort)
 region := "us-east-1"

 creds := credentials.NewEnvCredentials()
 authToken, err := rdsutils.BuildAuthToken(dbEndpoint, region, dbUser, creds)
 if err != nil {
 log.Fatalf("failed to build auth token %v", err)
 }
}
```

## Connecting to a DB instance

The following code example shows how to generate an authentication token, and then use it to connect to a DB instance.

This code connects to a MySQL DB instance.

```
package main

import (
 "database/sql"
 "fmt"
 "log"

 "github.com/aws/aws-sdk-go/aws/credentials"
 "github.com/aws/aws-sdk-go/service/rds/rdsutils"
 _ "github.com/go-sql-driver/mysql"
)

func main() {
 dbName := "app"
 dbUser := "jane_doe"
 dbHost := "mydb.123456789012.us-east-1.rds.amazonaws.com"
 dbPort := 3306
 dbEndpoint := fmt.Sprintf("%s:%d", dbHost, dbPort)
 region := "us-east-1"

 creds := credentials.NewEnvCredentials()
 authToken, err := rdsutils.BuildAuthToken(dbEndpoint, region, dbUser, creds)
 if err != nil {
 panic(err)
 }

 dsn := fmt.Sprintf("%s:%s@tcp(%s)/%s?tls=true&allowCleartextPasswords=true",
 dbUser, authToken, dbHost, dbName)
 db, err := sql.Open("mysql", dsn)
 if err != nil {
 log.Fatal(err)
 }
 defer db.Close()
}
```

```

 dbUser, authToken, dbEndpoint, dbName,
)

 db, err := sql.Open("mysql", dsn)
 if err != nil {
 panic(err)
 }

 err = db.Ping()
 if err != nil {
 panic(err)
 }
}

```

This code connects to a PostgreSQL DB instance.

```

package main

import (
 "database/sql"
 "fmt"

 "github.com/aws/aws-sdk-go/aws/credentials"
 "github.com/aws/aws-sdk-go/service/rds/rdsutils"
 _ "github.com/lib/pq"
)

func main() {
 dbName := "app"
 dbUser := "jane_doe"
 dbHost := "mydb.123456789012.us-east-1.rds.amazonaws.com"
 dbPort := 5432
 dbEndpoint := fmt.Sprintf("%s:%d", dbHost, dbPort)
 region := "us-east-1"

 creds := credentials.NewEnvCredentials()
 authToken, err := rdsutils.BuildAuthToken(dbEndpoint, region, dbUser, creds)
 if err != nil {
 panic(err)
 }

 dsn := fmt.Sprintf("host=%s port=%d user=%s password=%s dbname=%s",
 dbHost, dbPort, dbUser, authToken, dbName,
)

 db, err := sql.Open("postgres", dsn)
 if err != nil {
 panic(err)
 }

 err = db.Ping()
 if err != nil {
 panic(err)
 }
}

```

## Connecting to your DB instance using IAM authentication and the AWS SDK for Java

You can connect to an RDS for MySQL or RDS for PostgreSQL DB instance with the AWS SDK for Java as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)
- [Set up the AWS SDK for Java](#)

## Topics

- [Generating an IAM authentication token \(p. 1718\)](#)
- [Manually constructing an IAM authentication token \(p. 1719\)](#)
- [Connecting to a DB instance \(p. 1721\)](#)

### Generating an IAM authentication token

If you are writing programs using the AWS SDK for Java, you can get a signed authentication token using the `RdsIamAuthTokenGenerator` class. Using this class requires that you provide AWS credentials. To do this, you create an instance of the `DefaultAWSCredentialsProviderChain` class. `DefaultAWSCredentialsProviderChain` uses the first AWS access key and secret key that it finds in the [default credential provider chain](#). For more information about AWS access keys, see [Managing access keys for IAM users](#).

After you create an instance of `RdsIamAuthTokenGenerator`, you can call the `getAuthToken` method to obtain a signed token. Provide the AWS Region, host name, port number, and user name. The following code example illustrates how to do this.

```
package com.amazonaws.codesamples;

import com.amazonaws.auth.DefaultAWSCredentialsProviderChain;
import com.amazonaws.services.rds.auth.GetIamAuthTokenRequest;
import com.amazonaws.services.rds.auth.RdsIamAuthTokenGenerator;

public class GenerateRDSAuthToken {

 public static void main(String[] args) {

 String region = "us-west-2";
 String hostname = "rdsmysql.123456789012.us-west-2.rds.amazonaws.com";
 String port = "3306";
 String username = "jane_doe";

 System.out.println(generateAuthToken(region, hostname, port, username));
 }

 static String generateAuthToken(String region, String hostName, String port, String
username) {

 RdsIamAuthTokenGenerator generator = RdsIamAuthTokenGenerator.builder()
 .credentials(new DefaultAWSCredentialsProviderChain())
 .region(region)
 .build();

 String authToken = generator.getAuthToken(
 GetIamAuthTokenRequest.builder()
 .hostname(hostName)
 .port(Integer.parseInt(port))
 .userName(username)
 .build());

 return authToken;
 }
}
```

}

## Manually constructing an IAM authentication token

In Java, the easiest way to generate an authentication token is to use `RdsIamAuthTokenGenerator`. This class creates an authentication token for you, and then signs it using AWS signature version 4. For more information, see [Signature version 4 signing process](#) in the *AWS General Reference*.

However, you can also construct and sign an authentication token manually, as shown in the following code example.

```
package com.amazonaws.codesamples;

import com.amazonaws.SdkClientException;
import com.amazonaws.auth.DefaultAWSCredentialsProviderChain;
import com.amazonaws.auth.SigningAlgorithm;
import com.amazonaws.util.BinaryUtils;
import org.apache.commons.lang3.StringUtils;

import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;
import java.nio.charset.Charset;
import java.security.MessageDigest;
import java.text.SimpleDateFormat;
import java.util.Date;
import java.util.SortedMap;
import java.util.TreeMap;

import static com.amazonaws.auth.internal.SignerConstants.AWS4_TERMINATOR;
import static com.amazonaws.util.StringUtils.UTF8;

public class CreateRDSAuthTokenManually {

 "Unable to compute hash while signing request: "
 + e.getMessage(), e);
 }
}
}

```

## Connecting to a DB instance

The following code example shows how to generate an authentication token, and then use it to connect to an instance running MySQL.

To run this code example, you need the [AWS SDK for Java](#), found on the AWS site. In addition, you need the following:

- MySQL Connector/J. This code example was tested with `mysql-connector-java-5.1.33-bin.jar`.
- An intermediate certificate for Amazon RDS that is specific to an AWS Region. (For more information, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#).) At runtime, the class loader looks for the certificate in the same directory as this Java code example, so that the class loader can find it.
- Modify the values of the following variables as needed:
  - `RDS_INSTANCE_HOSTNAME` – The host name of the DB instance that you want to access.
  - `RDS_INSTANCE_PORT` – The port number used for connecting to your PostgreSQL DB instance.
  - `REGION_NAME` – The AWS Region where the DB instance is running.
  - `DB_USER` – The database account that you want to access.
  - `SSL_CERTIFICATE` – An SSL certificate for Amazon RDS that is specific to an AWS Region.

To download a certificate for your AWS Region, see [Using SSL/TLS to encrypt a connection to a DB instance \(p. 1672\)](#). Place the SSL certificate in the same directory as this Java program file, so that the class loader can find the certificate at runtime.

This code example obtains AWS credentials from the [default credential provider chain](#).

```

 System.clearProperty("javax.net.ssl.trustStorePassword");
 }

}
```

## Connecting to your DB instance using IAM authentication and the AWS SDK for Python (Boto3)

You can connect to an RDS for MySQL or RDS for PostgreSQL DB instance with the AWS SDK for Python (Boto3) as described following.

The following are prerequisites for connecting to your DB instance using IAM authentication:

- [Enabling and disabling IAM database authentication \(p. 1700\)](#)
- [Creating and using an IAM policy for IAM database access \(p. 1702\)](#)
- [Creating a database account using IAM authentication \(p. 1705\)](#)

In addition, make sure the imported libraries in the sample code exist on your system.

The code examples use profiles for shared credentials. For information about the specifying credentials, see [Credentials](#) in the AWS SDK for Python (Boto3) documentation.

### Topics

- [Generating an IAM authentication token \(p. 1725\)](#)
- [Connecting to a DB instance \(p. 1726\)](#)

### Generating an IAM authentication token

You can call the `generate_db_auth_token` method to obtain a signed token. Provide the DB instance endpoint, port, user name, AWS Region, and DB engine to generate the token for connecting to a DB instance with IAM credentials.

This code generates an IAM authentication token for a MySQL DB instance.

```
import sys
import boto3
import os

ENDPOINT="mysqladb.123456789012.us-east-1.rds.amazonaws.com"
PORT="3306"
USR="jane_doe"
REGION="us-east-1"
os.environ['LIBMYSQL_ENABLE_CLEARTEXT_PLUGIN'] = '1'

#gets the credentials from .aws/credentials
```

```
session = boto3.Session(profile_name='RDSCreds')
client = session.client('rds')

token = client.generate_db_auth_token(DBHostname=ENDPOINT, Port=PORT, DBUsername=USR,
Region=REGION)
```

This code generates an IAM authentication token for a PostgreSQL DB instance.

```
import sys
import boto3
import os

ENDPOINT="postgresmydb.123456789012.us-east-1.rds.amazonaws.com"
PORT="5432"
USR="jane_doe"
REGION="us-east-1"

#gets the credentials from .aws/credentials
session = boto3.Session(profile_name='RDSCreds')
client = session.client('rds')

token = client.generate_db_auth_token(DBHostname=ENDPOINT, Port=PORT, DBUsername=USR,
Region=REGION)
```

## Connecting to a DB instance

The following code example shows how to generate an authentication token, and then use it to connect to a DB instance.

To run this code example, you need the [AWS SDK for Python \(Boto3\)](#), found on the AWS site.

Modify the values of the following variables as needed:

- **ENDPOINT** – The endpoint of the DB instance that you want to access
- **PORT** – The port number used for connecting to your DB instance
- **USER** – The database account that you want to access.
- **REGION** – The AWS Region where the DB instance is running
- **DBNAME** – The database that you want to access

This code connects to a MySQL DB instance.

```
import mysql.connector
import sys
import boto3
import os

ENDPOINT="mysqladb.123456789012.us-east-1.rds.amazonaws.com"
PORT="3306"
USR="jane_doe"
REGION="us-east-1"
DBNAME="mydb"
os.environ['LIBMYSQL_ENABLE_CLEARTEXT_PLUGIN'] = '1'

#gets the credentials from .aws/credentials
session = boto3.Session(profile_name='default')
```

```
client = session.client('rds')

token = client.generate_db_auth_token(DBHostname=ENDPOINT, Port=PORT, DBUsername=USR,
Region=REGION)

try:
 conn = mysql.connector.connect(host=ENDPOINT, user=USR, passwd=token, port=PORT,
database=DBNAME, ssl_ca='[full path]rds-combined-ca-bundle.pem')
 cur = conn.cursor()
 cur.execute("""SELECT now()""")
 query_results = cur.fetchall()
 print(query_results)
except Exception as e:
 print("Database connection failed due to {}".format(e))
```

This code connects to a PostgreSQL DB instance.

```
import psycopg2
import sys
import boto3
import os

ENDPOINT="postgresmydb.123456789012.us-east-1.rds.amazonaws.com"
PORT="5432"
USR="jane_doe"
REGION="us-east-1"
DBNAME="mydb"

#gets the credentials from .aws/credentials
session = boto3.Session(profile_name='RDSCreds')
client = session.client('rds')

token = client.generate_db_auth_token(DBHostname=ENDPOINT, Port=PORT, DBUsername=USR,
Region=REGION)

try:
 conn = psycopg2.connect(host=ENDPOINT, port=PORT, database=DBNAME, user=USR,
password=token, ssl_ca='[full path]rds-combined-ca-bundle.pem')
 cur = conn.cursor()
 cur.execute("""SELECT now()""")
 query_results = cur.fetchall()
 print(query_results)
except Exception as e:
 print("Database connection failed due to {}".format(e))
```

## Troubleshooting Amazon RDS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Amazon RDS and IAM.

### Topics

- [I'm not authorized to perform an action in Amazon RDS \(p. 1728\)](#)
- [I'm not authorized to perform iam:PassRole \(p. 1728\)](#)
- [I want to view my access keys \(p. 1728\)](#)
- [I'm an administrator and want to allow others to access Amazon RDS \(p. 1729\)](#)
- [I want to allow people outside of my AWS account to access my Amazon RDS resources \(p. 1729\)](#)

## I'm not authorized to perform an action in Amazon RDS

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a `widget` but does not have `rds:GetWidget` permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
rds:GetWidget on resource: my-example-widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the `my-example-widget` resource using the `rds:GetWidget` action.

## I'm not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password. Ask that person to update your policies to allow you to pass a role to Amazon RDS.

Some AWS services allow you to pass an existing role to that service, instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Amazon RDS. However, the action requires the service to have permissions granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole
```

In this case, Mary asks her administrator to update her policies to allow her to perform the `iam:PassRole` action.

## I want to view my access keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, `AKIAIOSFODNN7EXAMPLE`) and a secret access key (for example, `wJAlrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

### Important

Do not provide your access keys to a third party, even to help [find your canonical user ID](#). By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see [Managing access keys](#) in the *IAM User Guide*.

## I'm an administrator and want to allow others to access Amazon RDS

To enable others to access Amazon RDS, you must create an IAM entity (user or role) for the person or application that needs access. They use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in Amazon RDS.

To get started right away, see [Creating your first IAM delegated user and group](#) in the *IAM User Guide*.

## I want to allow people outside of my AWS account to access my Amazon RDS resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Amazon RDS supports these features, see [How Amazon RDS works with IAM \(p. 1686\)](#).
- To learn how to provide access to your resources across AWS accounts that you own, see [Providing access to an IAM user in another AWS account that you own](#) in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see [Providing access to AWS accounts owned by third parties](#) in the *IAM User Guide*.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users \(identity federation\)](#) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see [How IAM roles differ from resource-based policies](#) in the *IAM User Guide*.

## Logging and monitoring in Amazon RDS

Monitoring is an important part of maintaining the reliability, availability, and performance of Amazon RDS and your AWS solutions. You should collect monitoring data from all of the parts of your AWS solution so that you can more easily debug a multi-point failure if one occurs. AWS provides several tools for monitoring your Amazon RDS resources and responding to potential incidents:

### Amazon CloudWatch Alarms

Using Amazon CloudWatch alarms, you watch a single metric over a time period that you specify. If the metric exceeds a given threshold, a notification is sent to an Amazon SNS topic or AWS Auto Scaling policy. CloudWatch alarms do not invoke actions because they are in a particular state. Rather the state must have changed and been maintained for a specified number of periods.

### AWS CloudTrail Logs

CloudTrail provides a record of actions taken by a user, role, or an AWS service in Amazon RDS. CloudTrail captures all API calls for Amazon RDS as events, including calls from the console and from code calls to Amazon RDS API operations. Using the information collected by CloudTrail, you can determine the request that was made to Amazon RDS, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, see [Working with AWS CloudTrail and Amazon RDS \(p. 563\)](#).

## Enhanced Monitoring

Amazon RDS provides metrics in real time for the operating system (OS) that your DB instance runs on. You can view the metrics for your DB instance using the console, or consume the Enhanced Monitoring JSON output from Amazon CloudWatch Logs in a monitoring system of your choice. For more information, see [Monitoring OS metrics using Enhanced Monitoring \(p. 477\)](#).

## Amazon RDS Performance Insights

Performance Insights expands on existing Amazon RDS monitoring features to illustrate your database's performance and help you analyze any issues that affect it. With the Performance Insights dashboard, you can visualize the database load and filter the load by waits, SQL statements, hosts, or users. For more information, see [Monitoring with Performance Insights on Amazon RDS \(p. 417\)](#).

## Database Logs

You can view, download, and watch database logs using the AWS Management Console, AWS CLI, or RDS API. For more information, see [Working with Amazon RDS database log files \(p. 524\)](#).

## Amazon RDS Recommendations

Amazon RDS provides automated recommendations for database resources. These recommendations provide best practice guidance by analyzing DB instance configuration, usage, and performance data. For more information, see [Viewing Amazon RDS recommendations \(p. 410\)](#).

## Amazon RDS Event Notification

Amazon RDS uses the Amazon Simple Notification Service (Amazon SNS) to provide notification when an Amazon RDS event occurs. These notifications can be in any notification form supported by Amazon SNS for an AWS Region, such as an email, a text message, or a call to an HTTP endpoint. For more information, see [Using Amazon RDS event notification \(p. 504\)](#).

## AWS Trusted Advisor

Trusted Advisor draws upon best practices learned from serving hundreds of thousands of AWS customers. Trusted Advisor inspects your AWS environment and then makes recommendations when opportunities exist to save money, improve system availability and performance, or help close security gaps. All AWS customers have access to five Trusted Advisor checks. Customers with a Business or Enterprise support plan can view all Trusted Advisor checks.

Trusted Advisor has the following Amazon RDS-related checks:

- Amazon RDS Idle DB Instances
- Amazon RDS Security Group Access Risk
- Amazon RDS Backups
- Amazon RDS Multi-AZ

For more information on these checks, see [Trusted Advisor best practices \(checks\)](#).

For more information about monitoring Amazon RDS, see [Monitoring an Amazon RDS DB instance \(p. 402\)](#).

# Compliance validation for Amazon RDS

Third-party auditors assess the security and compliance of Amazon RDS as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see [AWS services in scope by compliance program](#). For general information, see [AWS compliance programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading reports in AWS Artifact](#).

Your compliance responsibility when using Amazon RDS is determined by the sensitivity of your data, your organization's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and compliance quick start guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- [Architecting for HIPAA security and compliance whitepaper](#) – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
- [AWS compliance resources](#) – This collection of workbooks and guides that might apply to your industry and location.
- [AWS Config](#) – This AWS service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

# Resilience in Amazon RDS

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS global infrastructure](#).

In addition to the AWS global infrastructure, Amazon RDS offers features to help support your data resiliency and backup needs.

## Backup and restore

Amazon RDS creates and saves automated backups of your DB instance. Amazon RDS creates a storage volume snapshot of your DB instance, backing up the entire DB instance and not just individual databases.

Amazon RDS creates automated backups of your DB instance during the backup window of your DB instance. Amazon RDS saves the automated backups of your DB instance according to the backup retention period that you specify. If necessary, you can recover your database to any point in time during the backup retention period. You can also back up your DB instance manually, by manually creating a DB snapshot.

You can create a DB instance by restoring from this DB snapshot as a disaster recovery solution if the source DB instance fails.

For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

## Replication

Amazon RDS uses the MariaDB, MySQL, Oracle, and PostgreSQL DB engines' built-in replication functionality to create a special type of DB instance called a read replica from a source DB instance. Updates made to the source DB instance are asynchronously copied to the read replica. You can reduce the load on your source DB instance by routing read queries from your applications to the read replica. Using read replicas, you can elastically scale out beyond the capacity constraints of a single DB instance for read-heavy database workloads. You can promote a read replica to a standalone instance as a disaster recovery solution if the source DB instance fails. For some DB engines, Amazon RDS also supports other replication options.

For more information, see [Working with read replicas \(p. 279\)](#).

## Failover

Amazon RDS provides high availability and failover support for DB instances using Multi-AZ deployments. Amazon RDS uses several different technologies to provide failover support. Multi-AZ deployments for Oracle, PostgreSQL, MySQL, and MariaDB DB instances use Amazon's failover technology. SQL Server DB instances use SQL Server Database Mirroring (DBM).

For more information, see [High availability \(Multi-AZ\) for Amazon RDS \(p. 52\)](#).

# Infrastructure security in Amazon RDS

As a managed service, Amazon RDS is protected by the AWS global network security procedures that are described in the [Amazon Web Services: Overview of security processes](#) whitepaper.

You use AWS published API calls to access Amazon RDS through the network. Clients must support Transport Layer Security (TLS) 1.0. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service \(AWS STS\)](#) to generate temporary security credentials to sign requests.

In addition, Amazon RDS offers features to help support infrastructure security.

## Security groups

Security groups control the access that traffic has in and out of a DB instance. By default, network access is turned off to a DB instance. You can specify rules in a security group that allow access from an IP address range, port, or security group. After ingress rules are configured, the same rules apply to all DB instances that are associated with that security group.

For more information, see [Controlling access with security groups \(p. 1737\)](#).

## Public accessibility

When you launch a DB instance inside a virtual private cloud (VPC) based on the Amazon VPC service, you can turn on or off public accessibility for that instance. To designate whether the DB instance that you create has a DNS name that resolves to a public IP address, you use the *Public accessibility* parameter. By using this parameter, you can designate whether there is public access to the DB instance. You can modify a DB instance to turn on or off public accessibility by modifying the *Public accessibility* parameter.

For more information, see [Hiding a DB instance in a VPC from the internet \(p. 1767\)](#).

### Note

If your DB instance is in a VPC but isn't publicly accessible, you can also use an AWS Site-to-Site VPN connection or an AWS Direct Connect connection to access it from a private network. For more information, see [Internetwork traffic privacy \(p. 1681\)](#).

# Amazon RDS API and interface VPC endpoints (AWS PrivateLink)

You can establish a private connection between your VPC and Amazon RDS API endpoints by creating an *interface VPC endpoint*. Interface endpoints are powered by [AWS PrivateLink](#).

AWS PrivateLink enables you to privately access Amazon RDS API operations without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to communicate with Amazon RDS API endpoints to launch, modify, or terminate DB instances. Your instances also don't need public IP addresses to use any of the available RDS API operations. Traffic between your VPC and Amazon RDS doesn't leave the Amazon network.

Each interface endpoint is represented by one or more elastic network interfaces in your subnets. For more information on elastic network interfaces, see [Elastic network interfaces](#) in the *Amazon EC2 User Guide*.

For more information about VPC endpoints, see [Interface VPC endpoints \(AWS PrivateLink\)](#) in the *Amazon VPC User Guide*. For more information about RDS API operations, see [Amazon RDS API Reference](#).

## Considerations for VPC endpoints

Before you set up an interface VPC endpoint for Amazon RDS API endpoints, ensure that you review [Interface endpoint properties and limitations](#) in the *Amazon VPC User Guide*.

All RDS API operations relevant to managing Amazon RDS resources are available from your VPC using AWS PrivateLink.

VPC endpoint policies are supported for RDS API endpoints. By default, full access to RDS API operations is allowed through the endpoint. For more information, see [Controlling access to services with VPC endpoints](#) in the *Amazon VPC User Guide*.

## Availability

Amazon RDS API currently supports VPC endpoints in the following AWS Regions:

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Africa (Cape Town)
- Asia Pacific (Hong Kong)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)

- Europe (Ireland)
- Europe (London)
- Europe (Paris)
- Europe (Stockholm)
- Europe (Milan)
- Middle East (Bahrain)
- South America (São Paulo)
- China (Beijing)
- China (Ningxia)
- AWS GovCloud (US-East)
- AWS GovCloud (US-West)

## Creating an interface VPC endpoint for Amazon RDS API

You can create a VPC endpoint for the Amazon RDS API using either the Amazon VPC console or the AWS Command Line Interface (AWS CLI). For more information, see [Creating an interface endpoint](#) in the *Amazon VPC User Guide*.

Create a VPC endpoint for Amazon RDS API using the service name `com.amazonaws.region.rds`.

Excluding AWS Regions in China, if you enable private DNS for the endpoint, you can make API requests to Amazon RDS with the VPC endpoint using its default DNS name for the AWS Region, for example `rds.us-east-1.amazonaws.com`. For the China (Beijing) and China (Ningxia) AWS Regions, you can make API requests with the VPC endpoint using `rds-api.cn-north-1.amazonaws.com.cn` and `rds-api.cn-northwest-1.amazonaws.com.cn`, respectively.

For more information, see [Accessing a service through an interface endpoint](#) in the *Amazon VPC User Guide*.

## Creating a VPC endpoint policy for Amazon RDS API

You can attach an endpoint policy to your VPC endpoint that controls access to Amazon RDS API. The policy specifies the following information:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see [Controlling access to services with VPC endpoints](#) in the *Amazon VPC User Guide*.

### Example: VPC endpoint policy for Amazon RDS API actions

The following is an example of an endpoint policy for Amazon RDS API. When attached to an endpoint, this policy grants access to the listed Amazon RDS API actions for all principals on all resources.

```
{
 "Statement": [
 {
```

```
 "Principal": "*",
 "Effect": "Allow",
 "Action": [
 "rds:CreateDBInstance",
 "rds:ModifyDBInstance",
 "rds:CreateDBSnapshot"
],
 "Resource": "*"
 }
}
```

#### Example: VPC endpoint policy that denies all access from a specified AWS account

The following VPC endpoint policy denies AWS account 123456789012 all access to resources using the endpoint. The policy allows all actions from other accounts.

```
{
 "Statement": [
 {
 "Action": "*",
 "Effect": "Allow",
 "Resource": "*",
 "Principal": "*"
 },
 {
 "Action": "*",
 "Effect": "Deny",
 "Resource": "*",
 "Principal": {
 "AWS": [
 "123456789012"
]
 }
 }
]
}
```

## Security best practices for Amazon RDS

Use AWS Identity and Access Management (IAM) accounts to control access to Amazon RDS API operations, especially operations that create, modify, or delete Amazon RDS resources. Such resources include DB instances, security groups, and parameter groups. Also use IAM to control actions that perform common administrative actions such as backing up and restoring DB instances.

- Create an individual IAM user for each person who manages Amazon RDS resources, including yourself. Don't use AWS root credentials to manage Amazon RDS resources.
- Grant each user the minimum set of permissions required to perform his or her duties.
- Use IAM groups to effectively manage permissions for multiple users.
- Rotate your IAM credentials regularly.
- Configure AWS Secrets Manager to automatically rotate the secrets for Amazon RDS. For more information, see [Rotating your AWS Secrets Manager secrets](#) in the *AWS Secrets Manager User Guide*. You can also retrieve the credential from AWS Secrets Manager programmatically. For more information, see [Retrieving the secret value](#) in the *AWS Secrets Manager User Guide*.

For more information about IAM, see [AWS Identity and Access Management](#). For information on IAM best practices, see [IAM best practices](#).

Use the AWS Management Console, the AWS CLI, or the RDS API to change the password for your master user. If you use another tool, such as a SQL client, to change the master user password, it might result in privileges being revoked for the user unintentionally.

## Controlling access with security groups

Security groups control the access that traffic has in and out of a DB instance. Three types of security groups are used with Amazon RDS: VPC security groups, DB security groups, and EC2-Classic security groups. In simple terms, these work as follows:

- A VPC security group controls access to DB instances and EC2 instances inside a VPC.
- A DB security group controls access to EC2-Classic DB instances that are not in a VPC.
- An EC2-Classic security group controls access to an EC2 instance. For more information about EC2-Classic security groups, see [EC2-Classic](#) in the Amazon EC2 documentation.

By default, network access is disabled for a DB instance. You can specify rules in a security group that allow access from an IP address range, port, or security group. Once ingress rules are configured, the same rules apply to all DB instances that are associated with that security group. You can specify up to 20 rules in a security group.

### VPC security groups

Each VPC security group rule enables a specific source to access a DB instance in a VPC that is associated with that VPC security group. The source can be a range of addresses (for example, 203.0.113.0/24), or another VPC security group. By specifying a VPC security group as the source, you allow incoming traffic from all instances (typically application servers) that use the source VPC security group. VPC security groups can have rules that govern both inbound and outbound traffic, though the outbound traffic rules typically do not apply to DB instances. Outbound traffic rules only apply if the DB instance acts as a client. For example, outbound traffic rules apply to an Oracle DB instance with outbound database links. You must use the [Amazon EC2 API](#) or the **Security Group** option on the VPC Console to create VPC security groups.

When you create rules for your VPC security group that allow access to the instances in your VPC, you must specify a port for each range of addresses that the rule allows access for. For example, if you want to enable SSH access to instances in the VPC, then you create a rule allowing access to TCP port 22 for the specified range of addresses.

You can configure multiple VPC security groups that allow access to different ports for different instances in your VPC. For example, you can create a VPC security group that allows access to TCP port 80 for web servers in your VPC. You can then create another VPC security group that allows access to TCP port 3306 for RDS for MySQL DB instances in your VPC.

For more information on VPC security groups, see [Security groups](#) in the *Amazon Virtual Private Cloud User Guide*.

#### Note

If your DB instance is in a VPC but isn't publicly accessible, you can also use an AWS Site-to-Site VPN connection or an AWS Direct Connect connection to access it from a private network. For more information, see [Internetwork traffic privacy \(p. 1681\)](#).

### DB security groups

DB security groups are used with DB instances that are not in a VPC and on the EC2-Classic platform. Each DB security group rule enables a specific source to access a DB instance that is associated with that

DB security group. The source can be a range of addresses (for example, 203.0.113.0/24), or an EC2-Classic security group. When you specify an EC2-Classic security group as the source, you allow incoming traffic from all EC2 instances that use that EC2-Classic security group. DB security group rules apply to inbound traffic only; outbound traffic is not currently permitted for DB instances.

You don't need to specify a destination port number when you create DB security group rules. The port number defined for the DB instance is used as the destination port number for all rules defined for the DB security group. DB security groups can be created using the Amazon RDS API operations or the Amazon RDS page of the AWS Management Console.

For more information about working with DB security groups, see [Working with DB security groups \(EC2-Classic platform\) \(p. 1742\)](#).

## DB security groups vs. VPC security groups

The following table shows the key differences between DB security groups and VPC security groups.

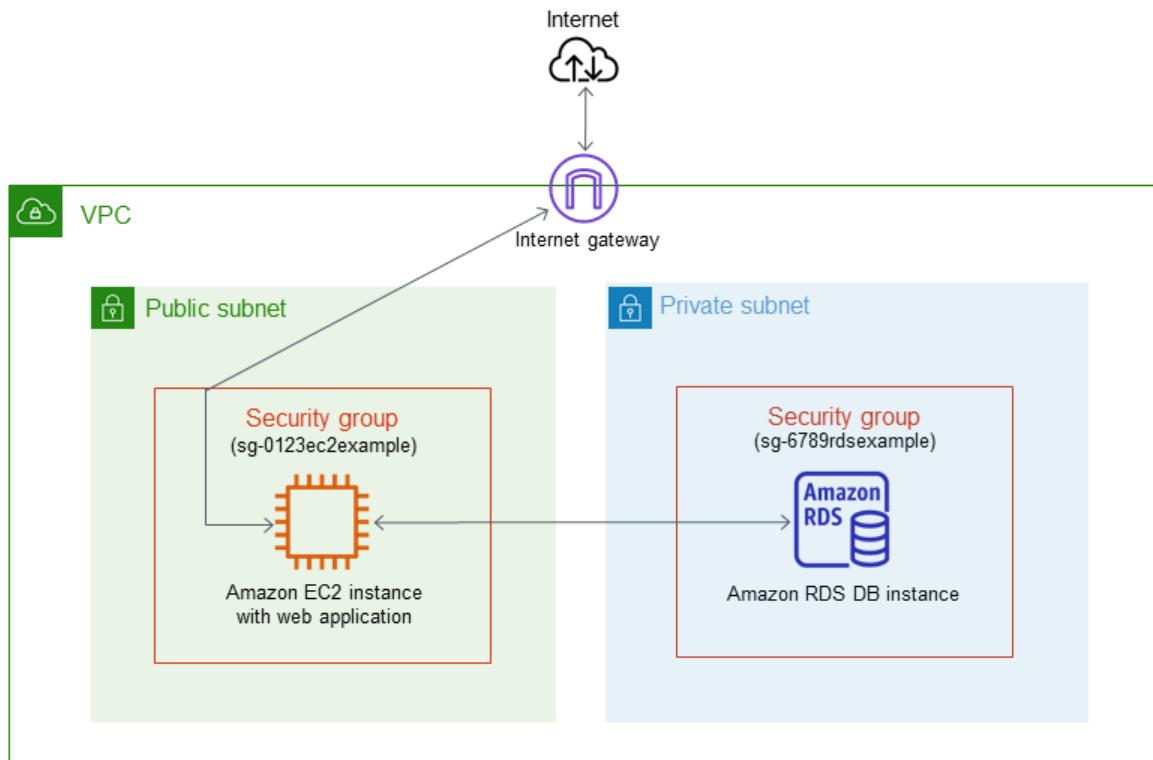

DB security group	VPC security group
Controls access to DB instances outside a VPC.	Controls access to DB instances in VPC.
Uses Amazon RDS API operations or the Amazon RDS page of the AWS Management Console to create and manage group and rules.	Uses Amazon EC2 API operations or the Amazon VPC page of the AWS Management Console to create and manage group and rules.
When you add a rule to a group, you don't need to specify port number or protocol.	When you add a rule to a group, specify the protocol as TCP. In addition, specify the same port number that you used to create the DB instances (or options) that you plan to add as members to the group.
Groups allow access from EC2-Classic security groups in your AWS account or other accounts.	Groups allow access from other VPC security groups in your VPC only.

## Security group scenario

A common use of a DB instance in a VPC is to share data with an application server running in an Amazon EC2 instance in the same VPC, which is accessed by a client application outside the VPC. For this scenario, you use the RDS and VPC pages on the AWS Management Console or the RDS and EC2 API operations to create the necessary instances and security groups:

1. Create a VPC security group (for example, `sg-0123ec2example`) and define inbound rules that use the IP addresses of the client application as the source. This security group allows your client application to connect to EC2 instances in a VPC that uses this security group.
2. Create an EC2 instance for the application and add the EC2 instance to the VPC security group (`sg-0123ec2example`) that you created in the previous step.
3. Create a second VPC security group (for example, `sg-6789rdsexample`) and create a new rule by specifying the VPC security group that you created in step 1 (`sg-0123ec2example`) as the source.
4. Create a new DB instance and add the DB instance to the VPC security group (`sg-6789rdsexample`) that you created in the previous step. When you create the DB instance, use the same port number as the one specified for the VPC security group (`sg-6789rdsexample`) rule that you created in step 3.

The following diagram shows this scenario.

For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

## Creating a VPC security group

You can create a VPC security group for a DB instance by using the VPC console. For information about creating a security group, see [Provide access to your DB instance in your VPC by creating a security group \(p. 69\)](#) and [Security groups](#) in the *Amazon Virtual Private Cloud User Guide*.

## Associating a security group with a DB instance

You can associate a security group with a DB instance by using **Modify** on the RDS console, the `ModifyDBInstance` Amazon RDS API, or the `modify-db-instance` AWS CLI command.

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#). For security group considerations when you restore a DB instance from a DB snapshot, see [Security group considerations \(p. 352\)](#).

## Deleting DB VPC security groups

DB VPC security groups are an RDS mechanism to synchronize security information with a VPC security group. However, this synchronization is no longer required, because RDS has been updated to use VPC security group information directly.

### Note

DB VPC security groups are deprecated, and they are different from DB security groups, VPC security groups, and EC2-Classic security groups.

We strongly recommend that you delete any DB VPC security groups that you currently use. If you don't delete your DB VPC security groups, you might encounter unintended behaviors with your DB instances,

which can be as severe as losing access to a DB instance. The unintended behaviors might result from taking an action such as an update to a DB instance, a parameter group, or similar. Such updates cause RDS to resynchronize the DB VPC security group with the VPC security group. This resynchronization can result in your security information being overwritten with incorrect and outdated security information. This in turn can have a severe impact on your ability to access to your DB instances.

## How can I determine if I have a DB VPC security group?

Because DB VPC security groups have been deprecated, they don't appear in the RDS console. However, you can call the [describe-db-security-groups](#) AWS CLI command or the [DescribeDBSecurityGroups](#) API operation to determine if you have any DB VPC security groups.

In this case, you can call the [describe-db-security-groups](#) AWS CLI command with JSON specified as the output format. If you do, you can identify DB VPC security groups by the VPC identifier on the second line of the output for the security group as shown in the following example.

```
{
 "DBSecurityGroups": [
 {
 "VpcId": "vpc-abcd1234",
 "DBSecurityGroupDescription": "default:vpc-abcd1234",
 "IPRanges": [
 {
 "Status": "authorized",
 "CIDRIP": "xxx.xxx.xxx.xxx/n"
 },
 {
 "Status": "authorized",
 "CIDRIP": "xxx.xxx.xxx.xxx/n"
 }
],
 "OwnerId": "123456789012",
 "EC2SecurityGroups": [],
 "DBSecurityGroupName": "default:vpc-abcd1234"
 }
]
}
```

If you run the [DescribeDBSecurityGroups](#) API operation, then you can identify DB VPC security groups using the `<VpcId>` response element as shown in the following example.

```
<DBSecurityGroup>
 <EC2SecurityGroups/>
 <DBSecurityGroupDescription>default:vpc-abcd1234</DBSecurityGroupDescription>
 <IPRanges>
 <IPRange>
 <CIDRIP>xxx.xxx.xxx.xxx/n</CIDRIP>
 <Status>authorized</Status>
 </IPRange>
 <IPRange>
 <CIDRIP>xxx.xxx.xxx.xxx/n</CIDRIP>
 <Status>authorized</Status>
 </IPRange>
 </IPRanges>
 <VpcId>vpc-abcd1234</VpcId>
 <OwnerId>123456789012</OwnerId>
 <DBSecurityGroupName>default:vpc-abcd1234</DBSecurityGroupName>
</DBSecurityGroup>
```

## How do I delete a DB VPC security group?

Because DB VPC security groups don't appear in the RDS console, you must call the [delete-db-security-group](#) AWS CLI command or the [DeleteDBSecurityGroup](#) API operation to delete a DB VPC security group.

After you delete a DB VPC security group, your DB instances in your VPC continue to be secured by the VPC security group for that VPC. The DB VPC security group that was deleted was merely a copy of the VPC security group information.

## Review your AWS CloudFormation templates

Older versions of AWS CloudFormation templates can contain instructions to create a DB VPC security group. Because DB VPC security groups are not yet fully deprecated, they can still be created. Make sure that any AWS CloudFormation templates that you use to provision a DB instance with security settings don't also create a DB VPC security group. Don't use AWS CloudFormation templates that create an RDS `DBSecurityGroup` with an `EC2VpcId` as shown in the following example.

```
{
 "DbSecurityByEC2SecurityGroup" : {
 "Type" : "AWS::RDS::DBSecurityGroup",
 "Properties" : {
 "GroupDescription" : "Ingress for security group",
 "EC2VpcId" : "MyVPC",
 "DBSecurityGroupIngress" : [{
 "EC2SecurityGroupId" : "sg-b0ff1111",
 "EC2SecurityGroupOwnerId" : "111122223333"
 }, {
 "EC2SecurityGroupId" : "sg-ffd722222",
 "EC2SecurityGroupOwnerId" : "111122223333"
 }]
 }
 }
}
```

Instead, add security information for your DB instances in a VPC using VPC security groups, as shown in the following example.

```
{
 "DBInstance" : {
 "Type": "AWS::RDS::DBInstance",
 "Properties": {
 "DBName" : { "Ref" : "DBName" },
 "Engine" : "MySQL",
 "MultiAZ" : { "Ref": "MultiAZDatabase" },
 "MasterUsername" : { "Ref" : "<master_username>" },
 "DBInstanceClass" : { "Ref" : "DBClass" },
 "AllocatedStorage" : { "Ref" : "DBAllocatedStorage" },
 "MasterUserPassword": { "Ref" : "<master_password>" },
 "VPCSecurityGroups" : [{ "Fn::GetAtt": ["VPCSecurityGroup", "GroupId"] }]
 }
 }
}
```

# Working with DB security groups (EC2-Classic platform)

By default, network access is turned off to a DB instance. You can specify rules in a *security group* that allows access from an IP address range, port, or security group. Once ingress rules are configured, the same rules apply to all DB instances that are associated with that security group. You can specify up to 20 rules in a security group.

Amazon RDS supports two different kinds of security groups. The one you use depends on which Amazon RDS platform you are on:

- **VPC security groups** – for the EC2-VPC platform.
- **DB security groups** – for the EC2-Classic platform.

You are most likely on the EC2-VPC platform (and must use VPC security groups) if any of the following are true:

- If you are a new Amazon RDS customer.
- If you have never created a DB instance before.
- If you are creating a DB instance in an AWS Region you have not used before.

Otherwise, if you are on the EC2-Classic platform, you use DB security groups to manage access to your Amazon RDS DB instances. For more information about the differences between DB security groups and VPC security groups, see [Controlling access with security groups \(p. 1737\)](#).

#### Note

To determine which platform you are on, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).

If you are on the EC2-VPC platform, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

#### Topics

- [Creating a DB security group \(p. 1742\)](#)
- [Listing available DB security groups \(p. 1744\)](#)

## Creating a DB security group

To create a DB security group, you need to provide a name and a description.

#### Console

##### To create a DB security group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

**Note**

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

3. Choose **Create DB Security Group**.
4. Type the name and description of the new DB security group in the **Name** and **Description** text boxes. The security group name can't contain spaces and can't start with a number.
5. Choose **Yes, Create**.

The DB security group is created.

A newly created DB security group doesn't provide access to a DB instance by default. You must specify a range of IP addresses or an EC2-Classic security group that can have access to the DB instance. To specify IP addresses or an EC2-Classic security group for a DB security group, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).

## AWS CLI

To create a DB security group, use the AWS CLI command `create-db-security-group`.

### Example

For Linux, macOS, or Unix:

```
aws rds create-db-security-group \
 --db-security-group-name mydbsecuritygroup \
 --db-security-group-description "My new security group"
```

For Windows:

```
aws rds create-db-security-group ^
 --db-security-group-name mydbsecuritygroup ^
 --db-security-group-description "My new security group"
```

A newly created DB security group doesn't provide access to a DB instance by default. You must specify a range of IP addresses or an EC2-Classic security group that can have access to the DB instance. To specify IP addresses or an EC2-Classic security group for a DB security group, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).

## API

To create a DB security group, call the Amazon RDS function `CreateDBSecurityGroup` with the following parameters:

- `DBSecurityGroupName` = *mydbsecuritygroup*
- `Description` = *"My new security group"*

### Example

```
https://rds.amazonaws.com/
 ?Action=CreateDBSecurityGroup
 &DBSecurityGroupName=mydbsecuritygroup
 &Description=My%20new%20db%20security%20group
 &Version=2012-01-15
 &SignatureVersion=2
```

```
&SignatureMethod=HmacSHA256
&Timestamp=2012-01-20T22%3A06%3A23.624Z
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

A newly created DB security group doesn't provide access to a DB instance by default. You must specify a range of IP addresses or an EC2-Classic security group that can have access to the DB instance. To specify IP addresses or an EC2-Classic security group for a DB security group, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).

## Listing available DB security groups

You can list which DB security groups have been created for your AWS account.

### Console

#### To list all available DB security groups for an AWS account

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

The available DB security groups appear in the **DB Security Groups** list.

#### Note

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

### AWS CLI

To list all available DB security groups for an AWS account, Use the AWS CLI command `describe-db-security-groups` with no parameters.

### Example

```
aws rds describe-db-security-groups
```

### API

To list all available DB security groups for an AWS account, call `DescribeDBSecurityGroups` with no parameters.

### Example

```
https://rds.amazonaws.com/
?Action=DescribeDBSecurityGroups
&MaxRecords=100
&Version=2009-10-16
&SignatureVersion=2
&SignatureMethod=HmacSHA256
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

## Viewing a DB security group

You can view detailed information about your DB security group to see what IP ranges have been authorized.

## Console

### To view properties of a specific DB security group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

#### Note

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

3. Select the details icon for the DB security group you want to view. The detailed information for the DB security group is displayed.

## AWS CLI

To view the properties of a specific DB security group use the AWS CLI `describe-db-security-groups`. Specify the DB security group you want to view.

### Example

For Linux, macOS, or Unix:

```
aws rds describe-db-security-groups \
--db-security-group-name mydbsecuritygroup
```

For Windows:

```
aws rds describe-db-security-groups ^
--db-security-group-name mydbsecuritygroup
```

## API

To view properties of a specific DB security group, call `DescribeDBSecurityGroups` with the following parameters:

- `DBSecurityGroupName=mydbsecuritygroup`

### Example

```
https://rds.amazonaws.com/
?Action=DescribeDBSecurityGroups
&DBSecurityGroupName=mydbsecuritygroup
&Version=2009-10-16
&SignatureVersion=2
&SignatureMethod=HmacSHA256
&Timestamp=2009-10-16T22%3A23%3A07.107Z
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

## Associating a DB security group with a DB instance

You can associate a DB security group with a DB instance using the RDS console's **Modify** option, the `ModifyDBInstance` Amazon RDS API, or the AWS CLI `modify-db-instance` command.

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Authorizing network access to a DB security group from an IP range

By default, network access is turned off to a DB instance. If you want to access a DB instance that is not in a VPC, you must set access rules for a DB security group to allow access from specific EC2-Classic security groups or CIDR IP ranges. You then must associate that DB instance with that DB security group. This process is called *ingress*. Once ingress is configured for a DB security group, the same ingress rules apply to all DB instances associated with that DB security group.

### Warning

Talk with your network administrator if you are intending to access a DB instance behind a firewall to determine the IP addresses you should use.

In following example, you configure a DB security group with an ingress rule for a CIDR IP range.

### Console

#### To configure a DB security group with an ingress rule for a CIDR IP range

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

### Note

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

3. Select the details icon for the DB security group you want to authorize.
4. In the details page for your security group, select *CIDR/IP* from the **Connection Type** drop-down list, type the CIDR range for the ingress rule you want to add to this DB security group into the **CIDR** text box, and choose **Authorize**.

### Tip

The AWS Management Console displays a CIDR IP based on your connection below the CIDR text field. If you are not accessing the DB instance from behind a firewall, you can use this CIDR IP.

5. The status of the ingress rule is **authorizing** until the new ingress rule has been applied to all DB instances that are associated with the DB security group that you modified. After the ingress rule has been successfully applied, the status changes to **authorized**.

### AWS CLI

To configure a DB security group with an ingress rule for a CIDR IP range, use the AWS CLI command `aws rds authorize-db-security-group-ingress`.

### Example

For Linux, macOS, or Unix:

```
aws rds authorize-db-security-group-ingress \
--db-security-group-name mydbsecuritygroup \
--cidr 192.168.1.10/27
```

For Windows:

```
aws rds authorize-db-security-group-ingress ^
--db-security-group-name mydbsecuritygroup ^
--cidrip 192.168.1.10/27
```

The command should produce output similar to the following.

```
SECURITYGROUP mydbsecuritygroup My new DBSecurityGroup
IP-RANGE 192.168.1.10/27 authorizing
```

## API

To configure a DB security group with an ingress rule for a CIDR IP range, call the Amazon RDS API [AuthorizeDBSecurityGroupIngress](#) with the following parameters:

- DBSecurityGroupName = *mydbsecuritygroup*
- CIDRIP = *192.168.1.10/27*

## Example

```
https://rds.amazonaws.com/
?Action=AuthorizeDBSecurityGroupIngress
&CIDRIP=192.168.1.10%2F27
&DBSecurityGroupName=mydbsecuritygroup
&Version=2009-10-16
&Action=AuthorizeDBSecurityGroupIngress
&SignatureVersion=2
&SignatureMethod=HmacSHA256
&Timestamp=2009-10-22T17%3A10%3A50.274Z
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

## Authorizing network access to a DB instance from an Amazon EC2 instance

If you want to access your DB instance from an Amazon EC2 instance, you must first determine if your EC2 instance and DB instance are in a VPC. If you are using a default VPC, you can assign the same EC2 or VPC security group that you used for your EC2 instance when you create or modify the DB instance that the EC2 instance accesses.

If your DB instance and EC2 instance are not in a VPC, you must configure the DB instance's security group with an ingress rule that allows traffic from the Amazon EC2 instance. You do this by adding the EC2-Classic security group for the EC2 instance to the DB security group for the DB instance. In this example, you add an ingress rule to a DB security group for an EC2-Classic security group.

### Important

- Adding an ingress rule to a DB security group for an EC2-Classic security group only grants access to your DB instances from Amazon EC2 instances associated with that EC2-Classic security group.
- You can't authorize an EC2-Classic security group that is in a different AWS Region than your DB instance. You can authorize an IP range, or specify an EC2-Classic security group in the same AWS Region that refers to IP address in another AWS Region. If you specify an IP range, we recommend that you use the private IP address of your Amazon EC2 instance, which provides a more direct network route from your Amazon EC2 instance to your Amazon RDS DB instance, and doesn't incur network charges for data sent outside of the Amazon network.

## Console

### To add an EC2-Classic security group to a DB security group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

#### Note

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

3. Select the details icon for the DB security group you want to grant access.
4. In the details page for your security group, choose **EC2 Security Group** for **Connection Type**, and then select the EC2-Classic security group you want to use. Then choose **Authorize**.
5. The status of the ingress rule is **authorizing** until the new ingress rule has been applied to all DB instances that are associated with the DB security group that you modified. After the ingress rule has been successfully applied, the status changes to **authorized**.

## AWS CLI

To grant access to an EC2-Classic security group, use the AWS CLI command `authorize-db-security-group-ingress`.

### Example

For Linux, macOS, or Unix:

```
aws rds authorize-db-security-group-ingress \
 --db-security-group-name default \
 --ec2-security-group-name myec2group \
 --ec2-security-group-owner-id 987654321021
```

For Windows:

```
aws rds authorize-db-security-group-ingress ^
 --db-security-group-name default ^
 --ec2-security-group-name myec2group ^
 --ec2-security-group-owner-id 987654321021
```

The command should produce output similar to the following:

SECGROUP	Name	Description
SECGROUP	<i>default</i>	default
EC2-SECGROUP	<i>myec2group</i>	<i>987654321021</i> authorizing

## API

To authorize network access to an EC2-Classic security group, call that Amazon RDS API function, [https://docs.aws.amazon.com/AmazonRDS/latest/APIReference/API\\_AuthorizeDBSecurityGroupIngress.html](https://docs.aws.amazon.com/AmazonRDS/latest/APIReference/API_AuthorizeDBSecurityGroupIngress.html) with the following parameters:

- `EC2SecurityGroupName` = *myec2group*
- `EC2SecurityGroupOwnerId` = *987654321021*

## Example

```
https://rds.amazonaws.com/
?Action=AuthorizeDBSecurityGroupIngress
&EC2SecurityGroupOwnerId=987654321021
&EC2SecurityGroupName=myec2group
&Version=2009-10-16
&SignatureVersion=2
&SignatureMethod=HmacSHA256
&Timestamp=2009-10-22T17%3A10%3A50.274Z
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

## Revoking network access to a DB instance from an IP range

You can easily revoke network access from a CIDR IP range to DB instances belonging to a DB security group by revoking the associated CIDR IP ingress rule.

In this example, you revoke an ingress rule for a CIDR IP range on a DB security group.

### Console

#### To revoke an ingress rule for a CIDR IP range on a DB security group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. From the navigation pane, choose **Security Groups**.

#### Note

If you are on the EC2-VPC platform, the **Security Groups** option does not appear in the navigation pane. In this case, you must use VPC security groups instead of DB security groups. For more information about using a VPC, see [Amazon Virtual Private Cloud VPCs and Amazon RDS \(p. 1756\)](#).

3. Select the details icon for the DB security group that has the ingress rule you want to revoke.
4. In the details page for your security group, choose **Remove** next to the ingress rule you want to revoke.
5. The status of the ingress rule is **revoking** until the ingress rule has been removed from all DB instances that are associated with the DB security group that you modified. After the ingress rule has been successfully removed, the ingress rule is removed from the DB security group.

### AWS CLI

To revoke an ingress rule for a CIDR IP range on a DB security group, use the AWS CLI command `revoke-db-security-group-ingress`.

## Example

For Linux, macOS, or Unix:

```
aws rds revoke-db-security-group-ingress \
--db-security-group-name mydbsecuritygroup \
--cidrip 192.168.1.1/27
```

For Windows:

```
aws rds revoke-db-security-group-ingress ^
--db-security-group-name mydbsecuritygroup ^
--cidrip 192.168.1.1/27
```

The command should produce output similar to the following.

```
SECGROUP mydbsecuritygroup My new DBSecurityGroup
IP-RANGE 192.168.1.1/27 revoking
```

## API

To revoke an ingress rule for a CIDR IP range on a DB security group, call the Amazon RDS API operation [https://docs.aws.amazon.com/AmazonRDS/latest/APIReference/API\\_RevokeDBSecurityGroupIngress.html](https://docs.aws.amazon.com/AmazonRDS/latest/APIReference/API_RevokeDBSecurityGroupIngress.html) with the following parameters:

- DBSecurityGroupName = *mydbsecuritygroup*
- CIDRIP = *192.168.1.10/27*

## Example

```
https://rds.amazonaws.com/
?Action=RevokeDBSecurityGroupIngress
&DBSecurityGroupName=mydbsecuritygroup
&CIDRIP=192.168.1.10%2F27
&Version=2009-10-16
&SignatureVersion=2&SignatureMethod=HmacSHA256
&Timestamp=2009-10-22T22%3A32%3A12.515Z
&AWSAccessKeyId=<Access Key ID>
&Signature=<Signature>
```

# Master user account privileges

When you create a new DB instance, the default master user that you use gets certain privileges for that DB instance. The following table shows the privileges and database roles the master user gets for each of the database engines.

### Important

We strongly recommend that you do not use the master user directly in your applications. Instead, adhere to the best practice of using a database user created with the minimal privileges required for your application.

### Note

If you accidentally delete the permissions for the master user, you can restore them by modifying the DB instance and setting a new master user password. For more information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

Database engine	System privilege	Database role
MySQL and MariaDB	SELECT, INSERT, UPDATE, DELETE, CREATE, DROP, RELOAD, PROCESS, REFERENCES, INDEX, ALTER, SHOW DATABASES, CREATE TEMPORARY TABLES, LOCK TABLES, EXECUTE, REPLICATION CLIENT, CREATE VIEW, SHOW VIEW, CREATE ROUTINE, ALTER ROUTINE, CREATE USER, EVENT, TRIGGER ON *.* WITH GRANT OPTION, REPLICATION SLAVE (only for RDS for MySQL versions 5.6, 5.7 and 8.0, RDS for MariaDB)	—

Database engine	System privilege	Database role
PostgreSQL	<pre>CREATE ROLE, CREATE DB, PASSWORD VALID UNTIL INFINITY, CREATE EXTENSION, ALTER EXTENSION, DROP EXTENSION, CREATE TABLESPACE, ALTER &lt; OBJECT&gt; OWNER, CHECKPOINT, PG_CANCEL_BACKEND(), PG_TERMINATE_BACKEND(), SELECT PG_STAT_REPLICATION, EXECUTE PG_STAT_STATEMENTS_RESET(), OWN POSTGRES_FDW_HANDLER(), OWN POSTGRES_FDW_VALIDATOR(), OWN POSTGRES_FDW, EXECUTE PG_BUFFERCACHE_PAGES(), SELECT PG_BUFFERCACHE</pre>	RDS_SUPERUSER
Oracle	<pre>ALTER DATABASE LINK, ALTER PUBLIC DATABASE LINK, DROP ANY DIRECTORY, EXEMPT ACCESS POLICY, EXEMPT IDENTITY POLICY, GRANT ANY OBJECT PRIVILEGE, RESTRICTED SESSION, EXEMPT REDACTION POLICY</pre>	AQ_ADMINISTRATOR_ROLE, AQ_USER_ROLE, CONNECT, CTXAPP, DBA, EXECUTE_CATALOG_ROLE, RECOVERY_CATALOG_OWNER, RESOURCE, SELECT_CATALOG_ROLE
Microsoft SQL Server	ADMINISTER BULK OPERATIONS, ALTER ANY CONNECTION, ALTER ANY LINKED SERVER, ALTER ANY LOGIN, ALTER SERVER STATE, ALTER TRACE, CONNECT SQL, CREATE ANY DATABASE, VIEW ANY DATABASE, VIEW ANY DEFINITION, VIEW SERVER STATE, ALTER ANY SERVER ROLE, ALTER ANY USER, ALTER ON ROLE SQLAgentOperatorRole	DB_OWNER (database-level role), PROCESSADMIN (server-level role), SETUPADMIN (server-level role), SQLAgentUserRole (database-level role)

# Using service-linked roles for Amazon RDS

Amazon RDS uses AWS Identity and Access Management (IAM) [service-linked roles](#). A service-linked role is a unique type of IAM role that is linked directly to Amazon RDS. Service-linked roles are predefined by Amazon RDS and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes using Amazon RDS easier because you don't have to manually add the necessary permissions. Amazon RDS defines the permissions of its service-linked roles, and unless defined otherwise, only Amazon RDS can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete the roles only after first deleting their related resources. This protects your Amazon RDS resources because you can't inadvertently remove permission to access the resources.

For information about other services that support service-linked roles, see [AWS services that work with IAM](#) and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

## Service-linked role permissions for Amazon RDS

Amazon RDS uses the service-linked role named **AWSServiceRoleForRDS** – to allow Amazon RDS to call AWS services on behalf of your DB instances.

The AWSServiceRoleForRDS service-linked role trusts the following services to assume the role:

- `rds.amazonaws.com`

The role permissions policy allows Amazon RDS to complete the following actions on the specified resources:

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "ec2:AuthorizeSecurityGroupIngress",
 "ec2:CreateNetworkInterface",
 "ec2:CreateSecurityGroup",
 "ec2:DeleteNetworkInterface",
 "ec2:DeleteSecurityGroup",
 "ec2:DescribeAvailabilityZones",
 "ec2:DescribeInternetGateways",
 "ec2:DescribeSecurityGroups",
 "ec2:DescribeSubnets",
 "ec2:DescribeVpcAttribute",
 "ec2:DescribeVpcs",
 "ec2:ModifyNetworkInterfaceAttribute",
 "ec2:ModifyVpcEndpoint",
 "ec2:RevokeSecurityGroupIngress",
 "ec2:CreateVpcEndpoint",
 "ec2:DescribeVpcEndpoints",
 "ec2:DeleteVpcEndpoints",
 "ec2:AssignPrivateIpAddresses",
 "ec2:UnassignPrivateIpAddresses"
],
 "Resource": "*"
 }
]
}
```

```

},
{
 "Effect": "Allow",
 "Action": [
 "sns:Publish"
],
 "Resource": "*"
},
{
 "Effect": "Allow",
 "Action": [
 "logs:CreateLogGroup"
],
 "Resource": [
 "arn:aws:logs:***:log-group:/aws/rds/*",
 "arn:aws:logs:***:log-group:/aws/docdb/*",
 "arn:aws:logs:***:log-group:/aws/neptune/*"
]
},
{
 "Effect": "Allow",
 "Action": [
 "logs:CreateLogStream",
 "logs:PutLogEvents",
 "logs:DescribeLogStreams"
],
 "Resource": [
 "arn:aws:logs:***:log-group:/aws/rds/*:log-stream:*",
 "arn:aws:logs:***:log-group:/aws/docdb/*:log-stream:*",
 "arn:aws:logs:***:log-group:/aws/neptune/*:log-stream:*
]
},
{
 "Effect": "Allow",
 "Action": [
 "kinesis:CreateStream",
 "kinesis:PutRecord",
 "kinesis:PutRecords",
 "kinesis:DescribeStream",
 "kinesis:SplitShard",
 "kinesis:MergeShards",
 "kinesis:DeleteStream",
 "kinesis:UpdateShardCount"
],
 "Resource": [
 "arn:aws:kinesis:***:stream/aws-rds-das-*"
]
}
]
}

```

### Note

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. If you encounter the following error message:

**Unable to create the resource. Verify that you have permission to create service linked role. Otherwise wait and try again later.**

Make sure you have the following permissions enabled:

```
{
 "Action": "iam:CreateServiceLinkedRole",
 "Effect": "Allow",
 "Resource": "arn:aws:iam:***:role/aws-service-role/rds.amazonaws.com/
AWSServiceRoleForRDS",
```

```
 "Condition": {
 "StringLike": {
 "iam:AWSServiceName": "rds.amazonaws.com"
 }
 }
}
```

For more information, see [Service-linked role permissions in the IAM User Guide](#).

## Creating a service-linked role for Amazon RDS

You don't need to manually create a service-linked role. When you create a DB instance, Amazon RDS creates the service-linked role for you.

**Important**

If you were using the Amazon RDS service before December 1, 2017, when it began supporting service-linked roles, then Amazon RDS created the AWSServiceRoleForRDS role in your account. To learn more, see [A new role appeared in my AWS account](#).

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you create a DB instance, Amazon RDS creates the service-linked role for you again.

## Editing a service-linked role for Amazon RDS

Amazon RDS does not allow you to edit the AWSServiceRoleForRDS service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see [Editing a service-linked role](#) in the *IAM User Guide*.

## Deleting a service-linked role for Amazon RDS

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must delete all of your DB instances before you can delete the service-linked role.

### Cleaning up a service-linked role

Before you can use IAM to delete a service-linked role, you must first confirm that the role has no active sessions and remove any resources used by the role.

#### To check whether the service-linked role has an active session in the IAM console

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane of the IAM console, choose **Roles**. Then choose the name (not the check box) of the AWSServiceRoleForRDS role.
3. On the **Summary** page for the chosen role, choose the **Access Advisor** tab.
4. On the **Access Advisor** tab, review recent activity for the service-linked role.

**Note**

If you are unsure whether Amazon RDS is using the AWSServiceRoleForRDS role, you can try to delete the role. If the service is using the role, then the deletion fails and you can view the AWS Regions where the role is being used. If the role is being used, then you must wait

for the session to end before you can delete the role. You cannot revoke the session for a service-linked role.

If you want to remove the AWSServiceRoleForRDS role, you must first delete *all* of your DB instances .

## Deleting all of your instances

Use one of these procedures to delete each of your instances.

### To delete an instance (console)

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**.
3. Choose the instance that you want to delete.
4. For **Actions**, choose **Delete**.
5. If you are prompted for **Create final Snapshot?**, choose **Yes** or **No**.
6. If you chose **Yes** in the previous step, for **Final snapshot name** enter the name of your final snapshot.
7. Choose **Delete**.

### To delete an instance (CLI)

See [delete-db-instance](#) in the *AWS CLI Command Reference*.

### To delete an instance (API)

See [DeleteDBInstance](#) in the *Amazon RDS API Reference*.

You can use the IAM console, the IAM CLI, or the IAM API to delete the AWSServiceRoleForRDS service-linked role. For more information, see [Deleting a service-linked role](#) in the *IAM User Guide*.

# Amazon Virtual Private Cloud VPCs and Amazon RDS

There are two Amazon Elastic Compute Cloud (EC2) platforms that host Amazon RDS DB instances, *EC2-VPC* and *EC2-Classic*. Amazon Virtual Private Cloud (Amazon VPC) enables you to launch AWS resources, such as Amazon RDS DB instances, into a virtual private cloud (VPC).

When you use an Amazon VPC, you have control over your virtual networking environment: you can choose your own IP address range, create subnets, and configure routing and access control lists. The basic functionality of Amazon RDS is the same whether your DB instance is running in an Amazon VPC or not: Amazon RDS manages backups, software patching, automatic failure detection, and recovery. There is no additional cost to run your DB instance in an Amazon VPC.

Accounts that support only the *EC2-VPC* platform have a default VPC. All new DB instances are created in the default VPC unless you specify otherwise. If you are a new Amazon RDS customer, if you have never created a DB instance before, or if you are creating a DB instance in an AWS Region you have not used before, you are most likely on the *EC2-VPC* platform and have a default VPC.

Some legacy DB instances on the *EC2-Classic* platform are not in a VPC. The legacy *EC2-Classic* platform does not have a default VPC, but as is true for either platform, you can create your own VPC and specify that a DB instance be located in that VPC.

## Topics

- [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#)
- [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#)
- [Working with a DB instance in a VPC \(p. 1765\)](#)
- [Updating the VPC for a DB instance \(p. 1772\)](#)
- [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#)

This documentation only discusses VPC functionality relevant to Amazon RDS DB instances. For more information about Amazon VPC, see [Amazon VPC Getting Started Guide](#) and [Amazon VPC User Guide](#). For information about using a network address translation (NAT) gateway, see [NAT gateways](#) in the [Amazon Virtual Private Cloud User Guide](#).

## Determining whether you are using the EC2-VPC or EC2-Classic platform

Your AWS account and the AWS Region you choose determines which of the two RDS platforms your DB instance is created on: *EC2-VPC* or *EC2-Classic*. The type of platform determines if you have a default VPC, and which type of security group you use to provide access to your DB instance.

The legacy *EC2-Classic* platform is the original platform used by Amazon RDS. If you are on this platform and want to use a VPC, you must create the VPC using the Amazon VPC console or Amazon VPC API. Accounts that only support the *EC2-VPC* platform have a default VPC where all DB instances are created, and you must use either an EC2 or VPC security group to provide access to the DB instance.

### Important

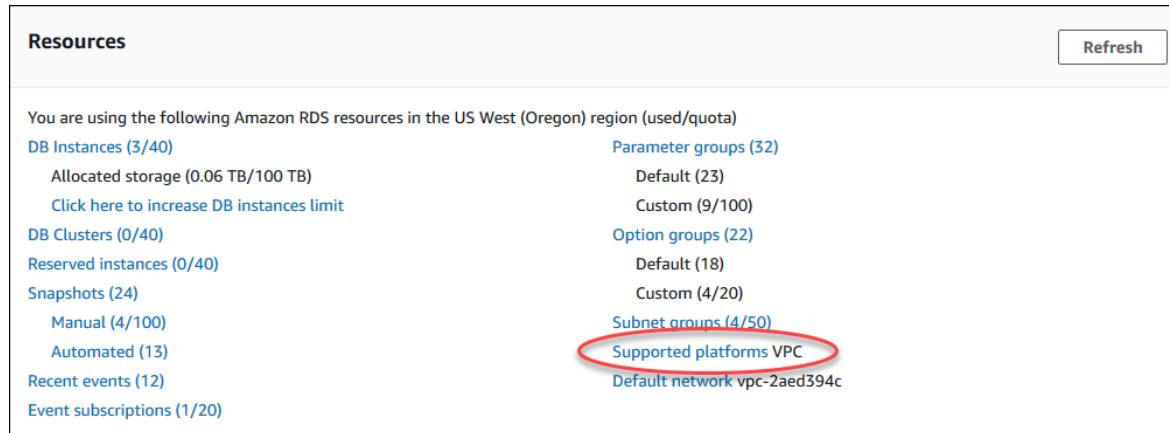

If you are a new Amazon RDS customer, if you have never created a DB instance before, or if you are creating a DB instance in an AWS Region you have not used before, in almost all cases you are on the *EC2-VPC* platform and have a default VPC.

You can tell which platform your AWS account in a given AWS Region is using by looking at the dashboard on the [RDS console](#) or [EC2](#) console. If you are a new Amazon RDS customer, if you have never

created a DB instance before, or if you are creating a DB instance in an AWS Region you have not used before, you might be redirected to the first-run console page and not see the home page following.

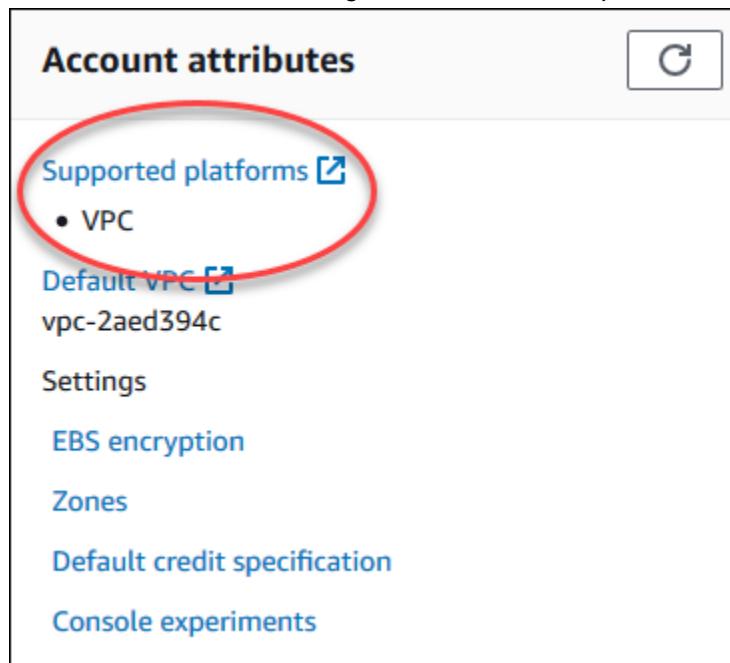

## EC2-VPC platform in the console

If **Supported platforms** indicates VPC, as shown following in the RDS console, your AWS account in the current AWS Region uses the *EC2-VPC* platform, and uses a default VPC.

The screenshot shows the 'Resources' page in the Amazon RDS console. The 'Supported platforms' section is highlighted with a red oval. It shows 'Supported platforms VPC' and 'Default network vpc-2aed394c'. Other sections include 'DB Instances (3/40)', 'DB Clusters (0/40)', 'Snapshots (24)', and 'Recent events (12)'. A 'Refresh' button is in the top right corner.

Similarly, if **Supported platforms** indicates VPC, as shown following in the EC2 console, your AWS account in the current AWS Region uses the *EC2-VPC* platform, and uses a default VPC.

The screenshot shows the 'Account attributes' page in the EC2 console. The 'Supported platforms' section is highlighted with a red oval. It shows 'VPC' and 'Default VPC vpc-2aed394c'. Other sections include 'Settings', 'EBS encryption', 'Zones', 'Default credit specification', and 'Console experiments'. A refresh icon is in the top right corner.

In both the RDS and EC2 console, the name of the default VPC is shown below the supported platform. To provide access to a DB instance created on the *EC2-VPC* platform, you must create a VPC security group. For information about creating a VPC security group, see [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#).

## EC2-Classic platform in the console

In both the RDS and EC2 console, if **Supported platforms** indicates EC2, VPC, your AWS account in the current AWS Region uses the *EC2-Classic* platform, and you do not have a default VPC. To provide

access to a DB instance created on the *EC2-Classic* platform, you must create a DB security group. For information about creating a DB security group, see [Creating a DB security group \(p. 1742\)](#).

**Note**

- You can create a VPC on the *EC2-Classic* platform, but one is not created for you by default as it is on accounts that support the *EC2-VPC* platform.
- If you want to move an existing DB instance into a VPC, you can use the AWS Management Console to do it easily. For more information, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).

## Scenarios for accessing a DB instance in a VPC

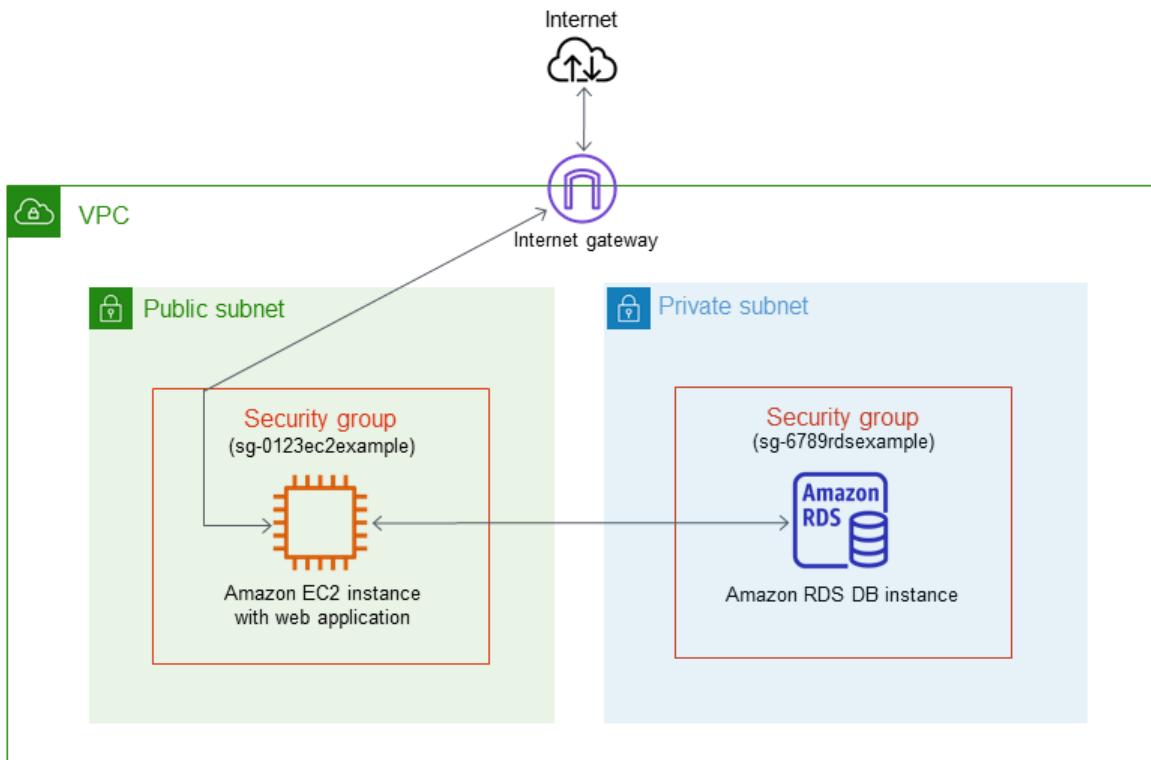

Amazon RDS supports the following scenarios for accessing a DB instance in a VPC:

- [An EC2 instance in the same VPC \(p. 1758\)](#)
- [An EC2 instance in a different VPC \(p. 1760\)](#)
- [A client application through the internet \(p. 1761\)](#)
- [A private network \(p. 1761\)](#)
- [An EC2 instance not in a VPC \(p. 1762\)](#)

### A DB instance in a VPC accessed by an EC2 instance in the same VPC

A common use of a DB instance in a VPC is to share data with an application server that is running in an EC2 instance in the same VPC. This is the user scenario created if you use AWS Elastic Beanstalk to create an EC2 instance and a DB instance in the same VPC.

The following diagram shows this scenario.

The simplest way to manage access between EC2 instances and DB instances in the same VPC is to do the following:

- Create a VPC security group for your DB instances to be in. This security group can be used to restrict access to the DB instances. For example, you can create a custom rule for this security group that allows TCP access using the port you assigned to the DB instance when you created it and an IP address you use to access the DB instance for development or other purposes.
- Create a VPC security group for your EC2 instances (web servers and clients) to be in. This security group can, if needed, allow access to the EC2 instance from the internet by using the VPC's routing table. For example, you can set rules on this security group to allow TCP access to the EC2 instance over port 22.
- Create custom rules in the security group for your DB instances that allow connections from the security group you created for your EC2 instances. This would allow any member of the security group to access the DB instances.

For a tutorial that shows you how to create a VPC with both public and private subnets for this scenario, see [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#).

**To create a rule in a VPC security group that allows connections from another security group, do the following:**

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc>.
2. In the navigation pane, choose **Security Groups**.
3. Choose or create a security group for which you want to allow access to members of another security group. In the scenario preceding, this is the security group that you use for your DB instances. Choose the **Inbound rules** tab, and then choose **Edit inbound rules**.
4. On the **Edit inbound rules** page, choose **Add rule**.

5. From **Type**, choose the entry that corresponds to the port you used when you created your DB instance, such as **MYSQL/Aurora**.
6. In the **Source** box, start typing the ID of the security group, which lists the matching security groups. Choose the security group with members that you want to have access to the resources protected by this security group. In the scenario preceding, this is the security group that you use for your EC2 instance.
7. If required, repeat the steps for the TCP protocol by creating a rule with **All TCP** as the **Type** and your security group in the **Source** box. If you intend to use the UDP protocol, create a rule with **All UDP** as the **Type** and your security group in the **Source** box.
8. Choose **Save rules** when you are done.

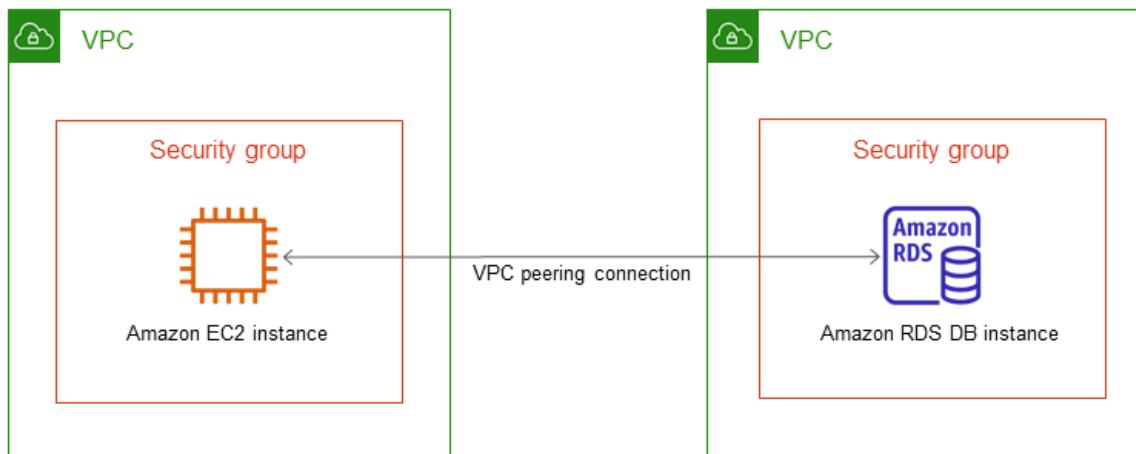

The following screen shows an inbound rule with a security group for its source.

Details	Inbound rules	Outbound rules	Tags
<b>Inbound rules</b>			
Type	Protocol	Port range	Source
MYSQL/Aurora	TCP	3306	sg-00bd2328e37926844 (tutorial-securitygroup)

## A DB instance in a VPC accessed by an EC2 instance in a different VPC

When your DB instance is in a different VPC from the EC2 instance you are using to access it, you can use VPC peering to access the DB instance.

The following diagram shows this scenario.

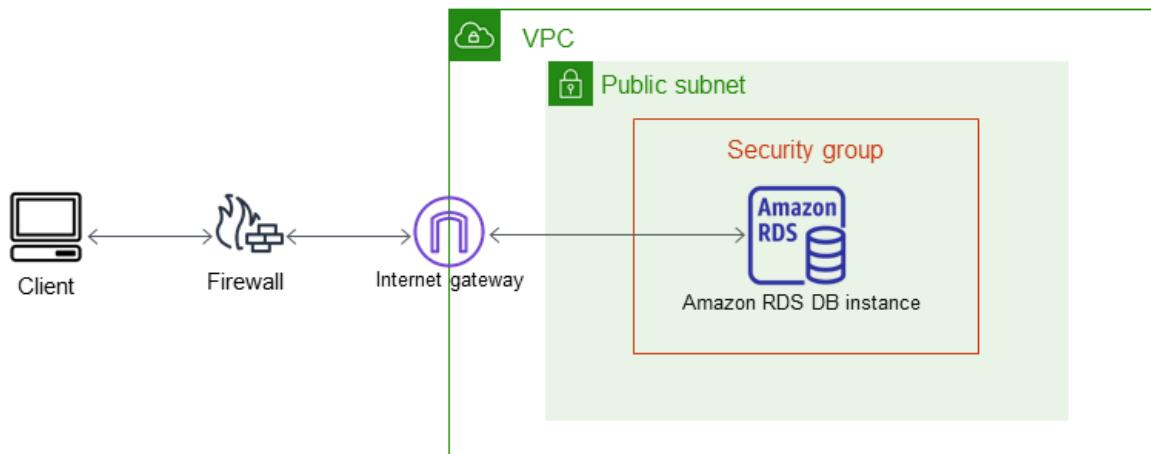

A VPC peering connection is a networking connection between two VPCs that enables you to route traffic between them using private IP addresses. Instances in either VPC can communicate with each other as if they are within the same network. You can create a VPC peering connection between your own VPCs, with a VPC in another AWS account, or with a VPC in a different AWS Region. To learn more about VPC peering, see [VPC peering](#) in the *Amazon Virtual Private Cloud User Guide*.

## A DB instance in a VPC accessed by a client application through the internet

To access a DB instance in a VPC from a client application through the internet, you configure a VPC with a single public subnet, and an internet gateway to enable communication over the internet.

The following diagram shows this scenario.

We recommend the following configuration:

- A VPC of size /16 (for example CIDR: 10.0.0.0/16). This size provides 65,536 private IP addresses.
- A subnet of size /24 (for example CIDR: 10.0.0.0/24). This size provides 256 private IP addresses.
- An Amazon RDS DB instance that is associated with the VPC and the subnet. Amazon RDS assigns an IP address within the subnet to your DB instance.
- An internet gateway which connects the VPC to the internet and to other AWS products.
- A security group associated with the DB instance. The security group's inbound rules allow your client application to access your DB instance.

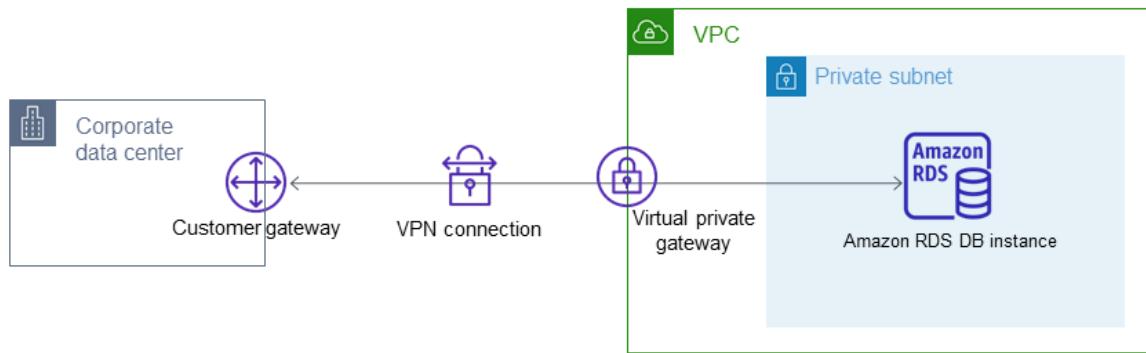

For information about creating a DB instance in a VPC, see [Creating a DB instance in a VPC \(p. 1768\)](#).

## A DB instance in a VPC accessed by a private network

If your DB instance isn't publicly accessible, you have the following options for accessing it from a private network:

- An AWS Site-to-Site VPN connection. For more information, see [What is AWS Site-to-Site VPN?](#)
- An AWS Direct Connect connection. For more information, see [What is AWS Direct Connect?](#)

The following diagram shows a scenario with an AWS Site-to-Site VPN connection.

For more information, see [Internetwork traffic privacy \(p. 1681\)](#).

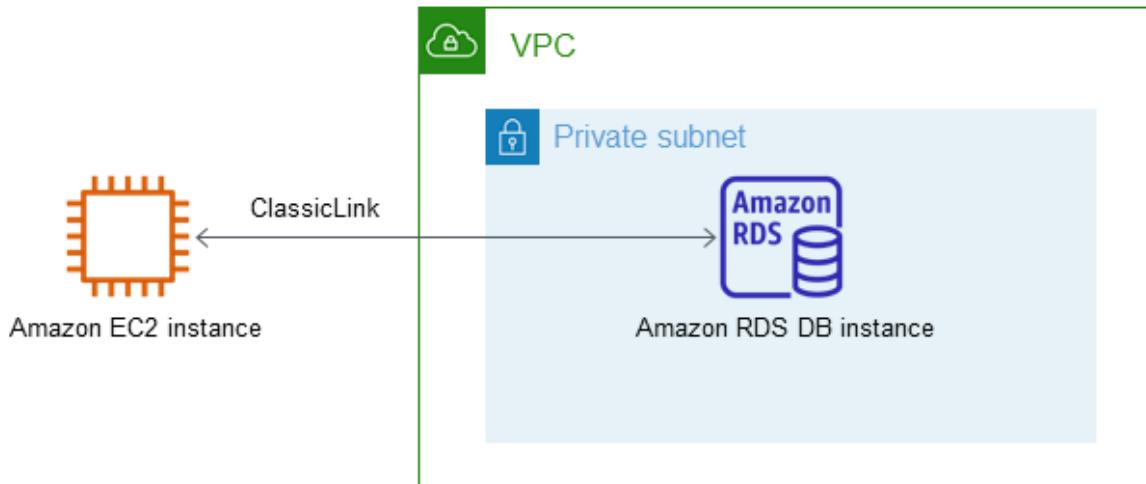

## A DB instance in a VPC accessed by an EC2 instance not in a VPC

You can communicate between an Amazon RDS DB instance that is in a VPC and an EC2 instance that is not in an Amazon VPC by using *ClassicLink*. When you use ClassicLink, an application on the EC2 instance can connect to the DB instance by using the endpoint for the DB instance. ClassicLink is available at no charge.

### Important

If your EC2 instance was created after 2013, it is probably in a VPC.

The following diagram shows this scenario.

Using ClassicLink, you can connect an EC2 instance to a logically isolated database where you define the IP address range and control the access control lists (ACLs) to manage network traffic. You don't have to use public IP addresses or tunneling to communicate with the DB instance in the VPC. This arrangement provides you with higher throughput and lower latency connectivity for inter-instance communications.

### To enable ClassicLink between a DB instance in a VPC and an EC2 instance not in a VPC

1. Sign in to the AWS Management Console and open the Amazon VPC console at <https://console.aws.amazon.com/vpc>.
2. In the navigation pane, choose **Your VPCs**.
3. Choose the VPC used by the DB instance.
4. In **Actions**, choose **Enable ClassicLink**. In the confirmation dialog box, choose **Yes, Enable**.

5. On the EC2 console, choose the EC2 instance you want to connect to the DB instance in the VPC.
6. In **Actions**, choose **ClassicLink**, and then choose **Link to VPC**.
7. On the **Link to VPC** page, choose the security group you want to use, and then choose **Link to VPC**.

**Note**

The ClassicLink features are only visible in the consoles for accounts and regions that support EC2-Classic. For more information, see [ClassicLink](#) in the *Amazon EC2 User Guide for Linux Instances*.

## Scenarios for accessing a DB instance not in a VPC

Amazon RDS supports the following scenarios for accessing a DB instance that is not in a VPC:

- [An EC2 instance in a VPC \(p. 1758\)](#)
- [A client application through the internet \(p. 1764\)](#)
- [An EC2 instance not in a VPC \(p. 1764\)](#)

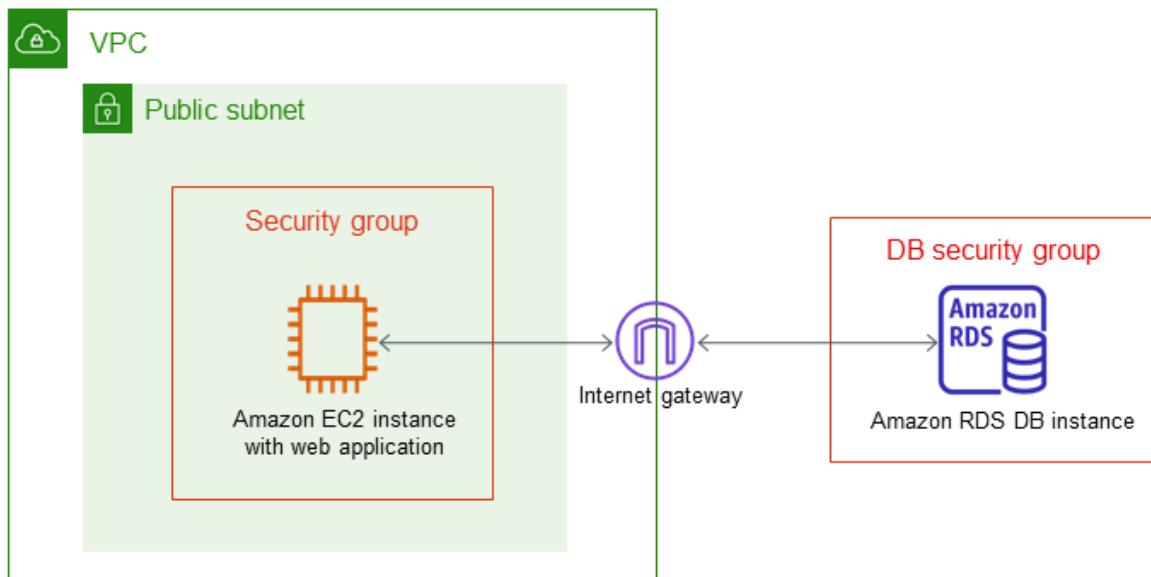

**Important**

If your DB instance was created after 2013, it is probably in a VPC. For information about accessing a DB instance in a VPC, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#).

### A DB instance not in a VPC accessed by an EC2 instance in a VPC

In the case where you have an EC2 instance in a VPC and an RDS DB instance not in a VPC, you can connect them over the public internet.

The following diagram shows this scenario.

**Note**

*ClassicLink*, as described in [A DB instance in a VPC accessed by an EC2 instance not in a VPC \(p. 1762\)](#), is not available for this scenario.

To connect your DB instance and your EC2 instance over the public internet, do the following:

- Ensure that the EC2 instance is in a public subnet in the VPC.

- Ensure that the RDS DB instance was marked as publicly accessible.
- A note about network ACLs here. A network ACL is like a firewall for your entire subnet. Therefore, all instances in that subnet are subject to network ACL rules. By default, network ACLs allow all traffic and you generally don't need to worry about them, unless you particularly want to add rules as an extra layer of security. A security group, on the other hand, is associated with individual instances, and you do need to worry about security group rules.
- Add the necessary ingress rules to the DB security group for the RDS DB instance.

An ingress rule specifies a network port and a CIDR/IP range. For example, you can add an ingress rule that allows port 3306 to connect to a MySQL RDS DB instance, and a CIDR/IP range of 203.0.113.25/32. For more information, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).

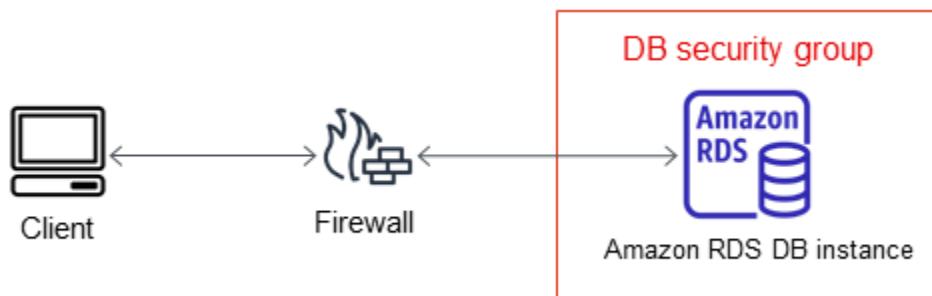

**Note**

If you are interested in moving an existing DB instance into a VPC, you can use the AWS Management Console to do it easily. For more information, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).

## A DB instance not in a VPC accessed by a client application through the internet

New Amazon RDS customers can only create a DB instance in a VPC. However, you might need to connect to an existing Amazon RDS DB instance that is not in a VPC from a client application through the internet.

The following diagram shows this scenario.

In this scenario, you must ensure that the DB security group for the RDS DB instance includes the necessary ingress rules for your client application to connect. An ingress rule specifies a network port and a CIDR/IP range. For example, you can add an ingress rule that allows port 3306 to connect to a MySQL RDS DB instance, and a CIDR/IP range of 203.0.113.25/32. For more information, see [Authorizing network access to a DB security group from an IP range \(p. 1746\)](#).

**Warning**

If you intend to access a DB instance behind a firewall, talk with your network administrator to determine the IP addresses you should use.

**Note**

If you are interested in moving an existing DB instance into a VPC, you can use the AWS Management Console to do it easily. For more information, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).

## A DB instance not in a VPC accessed by an EC2 instance not in a VPC

When neither your DB instance nor an application on an EC2 instance are in a VPC, you can access the DB instance by using its endpoint and port.

The following diagram shows this scenario.

You must create a security group for the DB instance that permits access from the port you specified when creating the DB instance. For example, you could use a connection string similar to this connection string used with *sqlplus* to access an Oracle DB instance:

```
PROMPT>sqlplus 'mydbusr@(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=<endpoint>)(PORT=<port number>))(CONNECT_DATA=(SID=<database name>)))'
```

For more information, see the following documentation.

Database engine	Relevant documentation
MariaDB	<a href="#">Connecting to a DB instance running the MariaDB database engine (p. 595)</a>
Microsoft SQL Server	<a href="#">Connecting to a DB instance running the Microsoft SQL Server database engine (p. 663)</a>
MySQL	<a href="#">Connecting to a DB instance running the MySQL database engine (p. 849)</a>
Oracle	<a href="#">Connecting to your Oracle DB instance (p. 1013)</a>
PostgreSQL	<a href="#">Connecting to a DB instance running the PostgreSQL database engine (p. 1546)</a>

**Note**

If you are interested in moving an existing DB instance into a VPC, you can use the AWS Management Console to do it easily. For more information, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).

## Working with a DB instance in a VPC

Unless you are working with a legacy DB instance, your DB instance is in a virtual private cloud (VPC). A VPC is a virtual network that is logically isolated from other virtual networks in the AWS Cloud. Amazon VPC lets you launch AWS resources, such as an Amazon RDS DB instance or Amazon EC2 instance, into a VPC. The VPC can either be a default VPC that comes with your account or one that you create. All VPCs are associated with your AWS account.

Your default VPC has three subnets you can use to isolate resources inside the VPC. The default VPC also has an internet gateway that can be used to provide access to resources inside the VPC from outside the VPC.

For a list of scenarios involving Amazon RDS DB instances in a VPC and outside of a VPC, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#).

For a tutorial that shows you how to create a VPC that you can use with a common Amazon RDS scenario, see [Tutorial: Create an Amazon VPC for use with a DB instance \(p. 1775\)](#).

To learn how to work with DB instances inside a VPC, see the following:

#### Topics

- [Working with a DB instance in a VPC \(p. 1766\)](#)
- [Working with DB subnet groups \(p. 1767\)](#)
- [Hiding a DB instance in a VPC from the internet \(p. 1767\)](#)
- [Creating a DB instance in a VPC \(p. 1768\)](#)

## Working with a DB instance in a VPC

Here are some tips on working with a DB instance in a VPC:

- Your VPC must have at least two subnets. These subnets must be in two different Availability Zones in the AWS Region where you want to deploy your DB instance. A subnet is a segment of a VPC's IP address range that you can specify and that lets you group instances based on your security and operational needs.

#### Note

The DB subnet group for a Local Zone can have only one subnet.

- If you want your DB instance in the VPC to be publicly accessible, you must enable the VPC attributes *DNS hostnames* and *DNS resolution*.
- Your VPC must have a DB subnet group that you create (for more information, see the next section). You create a DB subnet group by specifying the subnets you created. Amazon RDS chooses a subnet and an IP address within that subnet to associate with your DB instance. The DB instance uses the Availability Zone that contains the subnet.
- Your VPC must have a VPC security group that allows access to the DB instance.
- The CIDR blocks in each of your subnets must be large enough to accommodate spare IP addresses for Amazon RDS to use during maintenance activities, including failover and compute scaling.
- A VPC can have an *instance tenancy* attribute of either *default* or *dedicated*. All default VPCs have the instance tenancy attribute set to default, and a default VPC can support any DB instance class.

If you choose to have your DB instance in a dedicated VPC where the instance tenancy attribute is set to dedicated, the DB instance class of your DB instance must be one of the approved Amazon EC2 dedicated instance types. For example, the m3.medium EC2 dedicated instance corresponds to the db.m3.medium DB instance class. For information about instance tenancy in a VPC, see [Dedicated instances in the Amazon Elastic Compute Cloud User Guide](#).

For more information about the instance types that can be in a dedicated instance, see [Amazon EC2 dedicated instances](#) on the EC2 pricing page.

#### Note

When you set the instance tenancy attribute to dedicated for an Amazon RDS DB instance, it doesn't guarantee that the DB instance will run on a dedicated host.

- When an option group is assigned to a DB instance, it is linked to the supported platform the DB instance is on, either VPC or EC2-Classic (non-VPC). Furthermore, if a DB instance is in a VPC, the option group associated with the DB instance is linked to that VPC. This linkage means that you cannot use the option group assigned to a DB instance if you attempt to restore the DB instance into a different VPC or onto a different platform.
- If you restore a DB instance into a different VPC or onto a different platform, you must either assign the default option group to the DB instance, assign an option group that is linked to that VPC or platform, or create a new option group and assign it to the DB instance. With persistent or permanent options, such as Oracle TDE, you must create a new option group that includes the persistent or permanent option when restoring a DB instance into a different VPC.

## Working with DB subnet groups

Subnets are segments of a VPC's IP address range that you designate to group your resources based on security and operational needs. A DB subnet group is a collection of subnets (typically private) that you create in a VPC and that you then designate for your DB instances. A DB subnet group allows you to specify a particular VPC when creating DB instances using the CLI or API; if you use the console, you can just choose the VPC and subnets you want to use.

Each DB subnet group should have subnets in at least two Availability Zones in a given AWS Region. When creating a DB instance in a VPC, you must choose a DB subnet group. From the DB subnet group, Amazon RDS chooses a subnet and an IP address within that subnet to associate with your DB instance. The DB instance uses the Availability Zone that contains the subnet. If the primary DB instance of a Multi-AZ deployment fails, Amazon RDS can promote the corresponding standby and subsequently create a new standby using an IP address of the subnet in one of the other Availability Zones.

The subnets in a DB subnet group are either public or private. They can't be a mix of both public and private subnets. The subnets are public or private, depending on the configuration that you set for their network access control lists (network ACLs) and routing tables.

**Note**

The DB subnet group for a Local Zone can have only one subnet.

When Amazon RDS creates a DB instance in a VPC, it assigns a network interface to your DB instance by using an IP address from your DB subnet group. However, we strongly recommend that you use the DNS name to connect to your DB instance because the underlying IP address changes during failover.

**Note**

For each DB instance that you run in a VPC, make sure to reserve at least one address in each subnet in the DB subnet group for use by Amazon RDS for recovery actions.

## Hiding a DB instance in a VPC from the internet

One common Amazon RDS scenario is to have a VPC in which you have an EC2 instance with a public-facing web application and a DB instance with a database that is not publicly accessible. For example, you can create a VPC that has a public subnet and a private subnet. Amazon EC2 instances that function as web servers can be deployed in the public subnet, and the DB instances are deployed in the private subnet. In such a deployment, only the web servers have access to the DB instances. For an illustration of this scenario, see [A DB instance in a VPC accessed by an EC2 instance in the same VPC \(p. 1758\)](#).

When you launch a DB instance inside a VPC, the DB instance has a private IP address for traffic inside the VPC. This private IP address isn't publicly accessible. You can use the *Public access* option to designate whether the DB instance also has a public IP address in addition to the private IP address. If the DB instance is designated as publicly accessible, its DNS endpoint resolves to the private IP address from within the DB instance's VPC, and to the public IP address from outside of the DB instance's VPC. Access to the DB instance is ultimately controlled by the security group it uses, and that public access is not permitted if the security group assigned to the DB instance doesn't permit it.

You can modify a DB instance to turn on or off public accessibility by modifying the *Public access* option. For more information, see the modifying section for your DB engine.

The following illustration shows the **Public access** option in the **Additional connectivity configuration** section. To set the option, open the **Additional connectivity configuration** section in the **Connectivity** section.

**Connectivity**

Subnet group  
default

Security group  
List of DB security groups to associate with this DB instance.  
Choose security groups  
default X

Certificate authority  
rds-ca-2019

▼ Additional connectivity configuration

Public access

Publicly accessible  
EC2 instances and devices outside the VPC can connect to the instance. You define the security groups for supported devices and instances.

Not publicly accessible  
No IP address is assigned to the DB instance. EC2 instances and devices outside the VPC can't connect.

**⚠ Setting your DB instance accessibility to private might result in the loss of connectivity to your database. [Learn more](#)**

Database port  
Specify the TCP/IP port that the DB instance will use for application connections. The application connection string must specify the port number. The DB security group and your firewall must allow connections to the port. [Learn more](#)

3306

For information about modifying a DB instance to set the **Public access** option, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Creating a DB instance in a VPC

The following procedures help you create a DB instance in a VPC. If your account has a default VPC, you can begin with step 3 because the VPC and DB subnet group have already been created for you. If your AWS account doesn't have a default VPC, or if you want to create an additional VPC, you can create a new VPC.

If you don't know if you have a default VPC, see [Determining whether you are using the EC2-VPC or EC2-Classic platform \(p. 1756\)](#).

### Note

If you want your DB instance in the VPC to be publicly accessible, you must update the DNS information for the VPC by enabling the VPC attributes *DNS hostnames* and *DNS resolution*. For

information about updating the DNS information for a VPC instance, see [Updating DNS support for your VPC](#).

Follow these steps to create a DB instance in a VPC:

- [Step 1: Create a VPC \(p. 1769\)](#)
- [Step 2: Add subnets to the VPC \(p. 1769\)](#)
- [Step 3: Create a DB subnet group \(p. 1769\)](#)
- [Step 4: Create a VPC security group \(p. 1772\)](#)
- [Step 5: Create a DB instance in the VPC \(p. 1772\)](#)

## Step 1: Create a VPC

If your AWS account does not have a default VPC or if you want to create an additional VPC, follow the instructions for creating a new VPC. See [Create a VPC with private and public subnets \(p. 1775\)](#), or see [Step 1: Create a VPC](#) in the Amazon VPC documentation.

## Step 2: Add subnets to the VPC

Once you have created a VPC, you need to create subnets in at least two Availability Zones. You use these subnets when you create a DB subnet group. If you have a default VPC, a subnet is automatically created for you in each Availability Zone in the AWS Region.

For instructions on how to create subnets in a VPC, see [Create a VPC with private and public subnets \(p. 1775\)](#).

## Step 3: Create a DB subnet group

A DB subnet group is a collection of subnets (typically private) that you create for a VPC and that you then designate for your DB instances. A DB subnet group allows you to specify a particular VPC when you create DB instances using the CLI or API. If you use the console, you can just choose the VPC and subnets you want to use. Each DB subnet group must have at least one subnet in at least two Availability Zones in the AWS Region.

As a best practice, each DB subnet group should have at least one subnet for every Availability Zone in the AWS Region. For Multi-AZ deployments, defining a subnet for all Availability Zones in an AWS Region enables Amazon RDS to create a new standby replica in another Availability Zone if necessary. You can follow this best practice even for Single-AZ deployments, because you might convert them to Multi-AZ deployments in the future.

For a DB instance to be publicly accessible, the subnets in the DB subnet group must have an internet gateway. For more information about internet gateways for subnets, see [Internet gateways](#) in the Amazon VPC documentation.

### Note

The DB subnet group for a Local Zone can have only one subnet.

When you create a DB instance in a VPC, make sure to choose a DB subnet group. Amazon RDS chooses a subnet and an IP address within that subnet to associate with your DB instance. Amazon RDS creates and associates an Elastic Network Interface to your DB instance with that IP address. The DB instance uses the Availability Zone that contains the subnet. For Multi-AZ deployments, defining a subnet for two or more Availability Zones in an AWS Region allows Amazon RDS to create a new standby in another Availability Zone should the need arise. You need to do this even for Single-AZ deployments, just in case you want to convert them to Multi-AZ deployments at some point.

In this step, you create a DB subnet group and add the subnets that you created for your VPC.

### To create a DB subnet group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Subnet groups**.
3. Choose **Create DB Subnet Group**.
4. For **Name**, type the name of your DB subnet group.
5. For **Description**, type a description for your DB subnet group.
6. For **VPC**, choose the VPC that you created.
7. In the **Add subnets** section, choose the Availability Zones that include the subnets from **Availability Zones**, and then choose the subnets from **Subnets**.

## Create DB Subnet Group

To create a new subnet group, give it a name and a description, and choose an existing VPC. You will then be able to add subnets related to that VPC.

### Subnet group details

#### Name

You won't be able to modify the name after your subnet group has been created.

mydbsubnetgroup

Must contain from 1 to 255 characters. Alphanumeric characters, spaces, hyphens, underscores, and periods are allowed.

#### Description

My DB Subnet Group

#### VPC

Choose a VPC identifier that corresponds to the subnets you want to use for your DB subnet group. You won't be able to choose a different VPC identifier after your subnet group has been created.

tutorial-vpc (vpc-068fe388385afc014)

### Add subnets

#### Availability Zones

Choose the Availability Zones that include the subnets you want to add.

Choose an availability zone

us-east-1a X us-east-1c X

#### Subnets

Choose the subnets that you want to add. The list includes the subnets in the selected Availability Zones.

Select subnets

subnet-079bd4b8953aee1dd (10.0.0.0/24) X

subnet-057e85b72c46fdd9a (10.0.1.0/24) X

### Subnets selected (2)

Availability zone	Subnet ID	CIDR block
us-east-1a	subnet-079bd4b8953aee1dd	10.0.0.0/24
us-east-1c	subnet-057e85b72c46fdd9a	10.0.1.0/24

Cancel

Create

**Note**

If you have enabled a Local Zone, you can choose an Availability Zone group on the [Create DB subnet group](#) page. In this case, choose the **Availability Zone group, Availability Zones, and Subnets**.

8. Choose **Create**.

Your new DB subnet group appears in the DB subnet groups list on the RDS console. You can choose the DB subnet group to see details, including all of the subnets associated with the group, in the details pane at the bottom of the window.

## Step 4: Create a VPC security group

Before you create your DB instance, you must create a VPC security group to associate with your DB instance. For instructions on how to create a security group for your DB instance, see [Create a VPC security group for a private DB instance \(p. 1778\)](#), or see [Security groups for your VPC](#) in the Amazon VPC documentation.

## Step 5: Create a DB instance in the VPC

In this step, you create a DB instance and use the VPC name, the DB subnet group, and the VPC security group you created in the previous steps.

**Note**

If you want your DB instance in the VPC to be publicly accessible, you must enable the VPC attributes *DNS hostnames* and *DNS resolution*. For information on updating the DNS information for a VPC instance, see [Updating DNS support for your VPC](#).

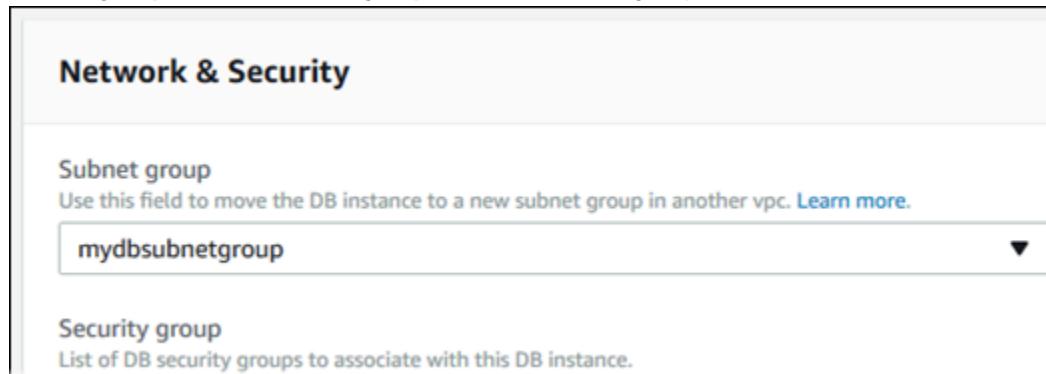

For details on how to create a DB instance, see [Creating an Amazon RDS DB instance \(p. 140\)](#).

When prompted in the **Network & Security** section, enter the VPC name, the DB subnet group, and the VPC security group you created in the previous steps.

## Updating the VPC for a DB instance

You can use the AWS Management Console to move your DB instance to a different VPC.

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#). In the **Network & Security** section of the modify page, shown following, enter the new subnet group for **Subnet group**. The new subnet group must be a subnet group in a new VPC.

## Moving a DB instance not in a VPC into a VPC

Some legacy DB instances on the EC2-Classic platform are not in a VPC. If your DB instance is not in a VPC, you can use the AWS Management Console to easily move your DB instance into a VPC. Before you can move a DB instance not in a VPC, into a VPC, you must create the VPC.

Follow these steps to create a VPC for your DB instance.

- [Step 1: Create a VPC \(p. 1769\)](#)
- [Step 2: Add subnets to the VPC \(p. 1769\)](#)
- [Step 3: Create a DB subnet group \(p. 1769\)](#)
- [Step 4: Create a VPC security group \(p. 1772\)](#)

Each DB subnet group must include at least the Availability Zones in which the DB instance is located.

After you create the VPC, follow these steps to move your DB instance into the VPC.

- [Updating the VPC for a DB instance \(p. 1772\)](#)

We highly recommend that you create a backup of your DB instance immediately before the migration. Doing so ensures that you can restore the data if the migration fails. For more information, see [Backing up and restoring an Amazon RDS DB instance \(p. 329\)](#).

The following are some limitations to moving your DB instance into the VPC.

- **Previous generation DB instance classes** – Previous generation DB instance classes might not be supported on the VPC platform. When moving a DB instance to a VPC, choose a db.m3 or db.r3 DB instance class. After you move the DB instance to a VPC, you can scale the DB instance to use a later DB instance class. For a full list of VPC supported instance classes, see [Amazon RDS instance types](#).
- **Multi-AZ** – Moving a Multi-AZ DB instance not in a VPC into a VPC is not currently supported. To move your DB instance to a VPC, first modify the DB instance so that it is a single-AZ deployment. Change the **Multi-AZ deployment** setting to **No**. After you move the DB instance to a VPC, modify it again to make it a Multi-AZ deployment. For more information, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).
- **Read replicas** – Moving a DB instance with read replicas not in a VPC into a VPC is not currently supported. To move your DB instance to a VPC, first delete all of its read replicas. After you move the DB instance to a VPC, recreate the read replicas. For more information, see [Working with read replicas \(p. 279\)](#).
- **Option groups** – If you move your DB instance to a VPC, and the DB instance is using a custom option group, change the option group that is associated with your DB instance. Option groups are platform-specific, and moving to a VPC is a change in platform. To use a custom option group in this case, assign the default VPC option group to the DB instance, assign an option group that is used by other DB instances in the VPC you are moving to, or create a new option group and assign it to the DB instance. For more information, see [Working with option groups \(p. 213\)](#).

## Alternatives for moving a DB instance not in a VPC into a VPC with minimal downtime

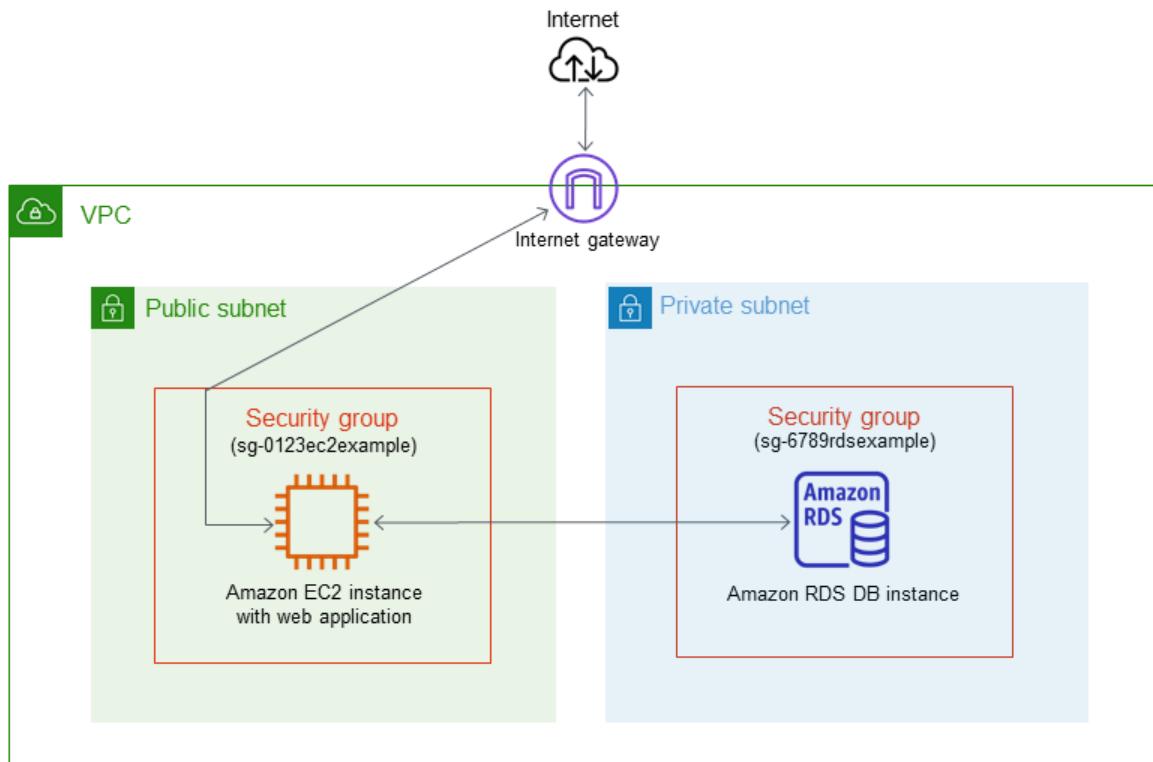

Using the following alternatives, you can move a DB instance not in a VPC into a VPC with minimal downtime. These alternatives cause minimum disruption to the source DB instance and allow it to serve user traffic during the migration. However, the time required to migrate to a VPC will vary based on the database size and the live workload characteristics.

- **AWS Database Migration Service (AWS DMS)** – AWS DMS enables the live migration of data while keeping the source DB instance fully operational, but it replicates only a limited set of DDL statements. AWS DMS doesn't propagate items such as indexes, users, privileges, stored procedures, and other database changes not directly related to table data. In addition, AWS DMS doesn't automatically use RDS snapshots for the initial DB instance creation, which can increase migration time. For more information, see [AWS Database Migration Service](#).
- **DB snapshot restore or point-in-time recovery** – You can move a DB instance to a VPC by restoring a snapshot of the DB instance or by restoring a DB instance to a point in time. For more information, see [Restoring from a DB snapshot \(p. 352\)](#) and [Restoring a DB instance to a specified time \(p. 392\)](#).

## Tutorial: Create an Amazon VPC for use with a DB instance

A common scenario includes a DB instance in an Amazon VPC, that shares data with a web server that is running in the same VPC. In this tutorial you create the VPC for this scenario.

The following diagram shows this scenario. For information about other scenarios, see [Scenarios for accessing a DB instance in a VPC \(p. 1758\)](#).

Because your DB instance only needs to be available to your web server, and not to the public Internet, you create a VPC with both public and private subnets. The web server is hosted in the public subnet, so that it can reach the public Internet. The DB instance is hosted in a private subnet. The web server is able to connect to the DB instance because it is hosted within the same VPC, but the DB instance is not available to the public Internet, providing greater security.

This tutorial describes configuring a VPC for Amazon RDS DB instances. For more information about Amazon VPC, see [Amazon VPC Getting Started Guide](#) and [Amazon VPC User Guide](#).

### Note

For a tutorial that shows you how to create a web server for this VPC scenario, see [Tutorial: Create a web server and an Amazon RDS DB instance \(p. 107\)](#).

## Create a VPC with private and public subnets

Use the following procedure to create a VPC with both public and private subnets.

### To create a VPC and subnets

1. If you don't have an Elastic IP address to associate with a network address translation (NAT) gateway, allocate one now. A NAT gateway is required for this tutorial. If you have an available Elastic IP address, move on to the next step.
  - a. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
  - b. In the top-right corner of the AWS Management Console, choose the Region to allocate your Elastic IP address in. The Region of your Elastic IP address should be the same as the Region where you want to create your VPC. This example uses the US West (Oregon) Region.
  - c. In the navigation pane, choose **Elastic IPs**.
  - d. Choose **Allocate Elastic IP address**.
  - e. If the console shows the **Network Border Group** field, keep the default value for it.
  - f. For **Public IPv4 address pool**, choose **Amazon's pool of IPv4 addresses**.
  - g. Choose **Allocate**.

Note the allocation ID of the new Elastic IP address because you'll need this information when you create your VPC.

For more information about Elastic IP addresses, see [Elastic IP addresses](#) in the *Amazon EC2 User Guide*. For more information about NAT gateways, see [NAT gateways](#) in the *Amazon VPC User Guide*.

2. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
3. In the top-right corner of the AWS Management Console, choose the Region to create your VPC in. This example uses the US West (Oregon) Region.
4. In the upper-left corner, choose **VPC Dashboard**. To begin creating a VPC, choose **Launch VPC Wizard**.
5. On the **Step 1: Select a VPC Configuration** page, choose **VPC with Public and Private Subnets**, and then choose **Select**.
6. On the **Step 2: VPC with Public and Private Subnets** page, set these values:
  - **IPv4 CIDR block:** 10.0.0.0/16
  - **IPv6 CIDR block:** No IPv6 CIDR Block
  - **VPC name:** tutorial-vpc
  - **Public subnet's IPv4 CIDR:** 10.0.0.0/24
  - **Availability Zone:** us-west-2a
  - **Public subnet name:** Tutorial public
  - **Private subnet's IPv4 CIDR:** 10.0.1.0/24
  - **Availability Zone:** us-west-2a
  - **Private subnet name:** Tutorial private 1
  - **Elastic IP Allocation ID:** An Elastic IP address to associate with the NAT gateway
  - **Service endpoints:** Skip this field.
  - **Enable DNS hostnames:** Yes
  - **Hardware tenancy:** Default
7. Choose **Create VPC**.

## Create additional subnets

You must have either two private subnets or two public subnets available to create a DB subnet group for a DB instance to use in a VPC. Because the DB instance for this tutorial is private, add a second private subnet to the VPC.

### To create an additional subnet

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
  2. To add the second private subnet to your VPC, choose **VPC Dashboard**, choose **Subnets**, and then choose **Create subnet**.
  3. On the **Create subnet** page, set these values:
    - **VPC ID:** Choose the VPC that you created in the previous step, for example: vpc-*identifier* (tutorial-vpc)
    - **Subnet name:** Tutorial private 2
    - **Availability Zone:** us-west-2b
- Note**  
Choose an Availability Zone that is different from the one that you chose for the first private subnet.
4. Choose **Create subnet**. Next, choose **Close** on the confirmation page.
  5. To ensure that the second private subnet that you created uses the same route table as the first private subnet, complete the following steps:
    - a. Choose **VPC Dashboard**, choose **Subnets**, and then choose the first private subnet that you created for the VPC, Tutorial private 1.
    - b. Below the list of subnets, choose the **Route table** tab, and note the value for **Route Table**—for example: rtb-98b613fd.
    - c. In the list of subnets, deselect the first private subnet.
    - d. In the list of subnets, choose the second private subnet Tutorial private 2, and choose the **Route table** tab.
    - e. If the current route table is not the same as the route table for the first private subnet, choose **Edit route table association**. For **Route table ID**, choose the route table that you noted earlier—for example: rtb-98b613fd. Next, to save your selection, choose **Save**.

## Create a VPC security group for a public web server

Next you create a security group for public access. To connect to public instances in your VPC, you add inbound rules to your VPC security group that allow traffic to connect from the internet.

### To create a VPC security group

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Choose **VPC Dashboard**, choose **Security Groups**, and then choose **Create security group**.
3. On the **Create security group** page, set these values:
  - **Security group name:** tutorial-securitygroup
  - **Description:** Tutorial Security Group
  - **VPC:** Choose the VPC that you created earlier, for example: vpc-*identifier* (tutorial-vpc)
4. Add inbound rules to the security group.
  - a. Determine the IP address to use to connect to instances in your VPC. To determine your public IP address, in a different browser window or tab, you can use the service at <https://checkip.amazonaws.com>. An example of an IP address is 203.0.113.25/32.

If you are connecting through an Internet service provider (ISP) or from behind your firewall without a static IP address, you need to find out the range of IP addresses used by client computers.

### Warning

If you use 0.0.0.0/0, you enable all IP addresses to access your public instances.

This approach is acceptable for a short time in a test environment, but it's unsafe for production environments. In production, you'll authorize only a specific IP address or range of addresses to access your instances.

- b. In the **Inbound rules** section, choose **Add rule**.
- c. Set the following values for your new inbound rule to allow Secure Shell (SSH) access to your EC2 instance. If you do this, you can connect to your EC2 instance to install the web server and other utilities, and to upload content for your web server.
  - **Type:** SSH
  - **Source:** The IP address or range from Step a, for example: 203.0.113.25/32.
- d. Choose **Add rule**.
- e. Set the following values for your new inbound rule to allow HTTP access to your web server.
  - **Type:** HTTP
  - **Source:** 0.0.0.0/0.

5. To create the security group, choose **Create security group**.

Note the security group ID because you need it later in this tutorial.

## Create a VPC security group for a private DB instance

To keep your DB instance private, create a second security group for private access. To connect to private instances in your VPC, you add inbound rules to your VPC security group that allow traffic from your web server only.

### To create a VPC security group

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Choose **VPC Dashboard**, choose **Security Groups**, and then choose **Create security group**.
3. On the **Create security group** page, set these values:
  - **Security group name:** tutorial-db-securitygroup
  - **Description:** Tutorial DB Instance Security Group
  - **VPC:** Choose the VPC that you created earlier, for example: vpc-*identifier* (tutorial-vpc)
4. Add inbound rules to the security group.
  - a. In the **Inbound rules** section, choose **Add rule**.
  - b. Set the following values for your new inbound rule to allow MySQL traffic on port 3306 from your EC2 instance. If you do this, you can connect from your web server to your DB instance to store and retrieve data from your web application to your database.
    - **Type:** MySQL/Aurora
    - **Source:** The identifier of the tutorial-securitygroup security group that you created previously in this tutorial, for example: sg-9edd5cfb.
5. To create the security group, choose **Create security group**.

## Create a DB subnet group

A DB subnet group is a collection of subnets that you create in a VPC and that you then designate for your DB instances. A DB subnet group allows you to specify a particular VPC when creating DB instances.

## To create a DB subnet group

1. Open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.

**Note**

Make sure you connect to the Amazon RDS console, not to the Amazon VPC console.

2. In the navigation pane, choose **Subnet groups**.
3. Choose **Create DB Subnet Group**.
4. On the **Create DB subnet group** page, set these values in **Subnet group details**:

- **Name:** tutorial-db-subnet-group
- **Description:** Tutorial DB Subnet Group
- **VPC:** tutorial-vpc (`vpc-identifier`)

5. In the **Add subnets** section, choose the **Availability Zones** and **Subnets**.

For this tutorial, choose `us-west-2a` and `us-west-2b` for the **Availability Zones**. Next, for **Subnets**, choose the subnets for IPv4 CIDR block `10.0.0.0/24`, `10.0.1.0/24`, and `10.0.2.0/24`.

**Note**

If you have enabled a Local Zone, you can choose an Availability Zone group on the **Create DB subnet group** page. In this case, choose the **Availability Zone group**, **Availability Zones**, and **Subnets**.

6. Choose **Create**.

Your new DB subnet group appears in the DB subnet groups list on the RDS console. You can click the DB subnet group to see details, including all of the subnets associated with the group, in the details pane at the bottom of the window.

**Note**

If you created this VPC to complete [Tutorial: Create a web server and an Amazon RDS DB instance \(p. 107\)](#), create the DB instance by following the instructions in [Create a DB instance \(p. 108\)](#).

# Quotas and constraints for Amazon RDS

Following, you can find a description of the resource quotas and naming constraints for Amazon RDS.

## Topics

- [Quotas in Amazon RDS \(p. 1780\)](#)
- [Naming constraints in Amazon RDS \(p. 1781\)](#)
- [Maximum number of database connections \(p. 1782\)](#)
- [File size limits in Amazon RDS \(p. 1783\)](#)

## Quotas in Amazon RDS

Each AWS account has quotas, for each AWS Region, on the number of Amazon RDS resources that can be created. After a quota for a resource has been reached, additional calls to create that resource fail with an exception.

The following table lists the resources and their quotas per AWS Region.

Name	Default	Adjustable
Authorizations per DB security group	20	No
DB cluster parameter groups	50	No
DB clusters	40	Yes
DB instances	40	Yes
DB subnet groups	50	Yes
Data API HTTP request body size	4 Megabytes	No
Data API maximum concurrent cluster-secret pairs	30	No
Data API maximum concurrent requests	500	No
Data API maximum result set size	1 Megabytes	No
Data API requests per second	1,000	No
Event subscriptions	20	Yes
IAM roles per DB cluster	5	Yes
IAM roles per DB instance	5	Yes
Manual DB cluster snapshots	100	Yes

Name	Default	Adjustable
Manual DB instance snapshots	100	Yes
Option groups	20	Yes
Parameter groups	50	Yes
Proxies	20	Yes
Read replicas per master	5	Yes
Reserved DB instances	40	Yes
Rules per security group	20	No
Security groups	25	Yes
Security groups (VPC)	5	No
Subnets per DB subnet group	20	No
Tags per resource	50	No
Total storage for all DB instances	100,000 Gigabytes	Yes

**Note**

By default, you can have up to a total of 40 DB instances. RDS DB instances, Aurora DB instances, Amazon Neptune instances, and Amazon DocumentDB instances apply to this quota. The following limitations apply to the Amazon RDS DB instances:

- 10 for each SQL Server edition (Enterprise, Standard, Web, and Express) under the "license-included" model
- 10 for Oracle under the "license-included" model
- 40 for MySQL, MariaDB, or PostgreSQL
- 40 for Oracle under the "bring-your-own-license" (BYOL) licensing model

If your application requires more DB instances, you can request additional DB instances by opening the [Service Quotas console](#). In the navigation pane, choose **AWS services**. Choose **Amazon Relational Database Service (Amazon RDS)**, choose a quota, and follow the directions to request a quota increase. For more information, see [Requesting a quota increase](#) in the *Service Quotas User Guide*.

Backups managed by AWS Backup are considered manual DB snapshots, but don't count toward the manual snapshot quota. For information about AWS Backup, see the [AWS Backup Developer Guide](#).

## Naming constraints in Amazon RDS

The following table describes naming constraints in Amazon RDS.

Resource or item	Constraints
DB instance identifier	Identifiers have these naming constraints:

Resource or item	Constraints
	<ul style="list-style-type: none"> <li>Must contain 1–63 alphanumeric characters or hyphens.</li> <li>First character must be a letter.</li> <li>Can't end with a hyphen or contain two consecutive hyphens.</li> <li>Must be unique for all DB instances per AWS account, per AWS Region.</li> </ul>
Database name	<p>Database name constraints differ for each database engine. For more information, see the available settings when creating each DB instance.</p> <p><b>Note</b> This approach doesn't apply to SQL Server. For SQL Server, you create your databases after you create your DB instance.</p>
Master user name	Master user name constraints differ for each database engine. For more information, see the available settings when creating each DB instance.
Master password	The password for the database master user can include any printable ASCII character except /, ", @, or a space. Master password length constraints differ for each database engine. For more information, see the available settings when creating each DB instance.
DB parameter group name	<p>These names have these constraints:</p> <ul style="list-style-type: none"> <li>Must contain 1–255 alphanumeric characters.</li> <li>First character must be a letter.</li> <li>Hyphens are allowed, but the name cannot end with a hyphen or contain two consecutive hyphens.</li> </ul>
DB subnet group name	<p>These names have these constraints:</p> <ul style="list-style-type: none"> <li>Must contain 1–255 characters.</li> <li>Alphanumeric characters, spaces, hyphens, underscores, and periods are allowed.</li> </ul>

## Maximum number of database connections

The maximum number of simultaneous database connections varies by the DB engine type and the memory allocation for the DB instance class. The maximum number of connections is set in the parameter group associated with the DB instance, except for Microsoft SQL Server, where it is set in the server properties for the DB instance in SQL Server Management Studio (SSMS).

`DBInstanceClassMemory` is in bytes. You can find the value of `DBInstanceClassMemory` in gibibytes (GiB) in the table of [Hardware specifications for DB instance classes \(p. 33\)](#).

**Note**

For Oracle, you set the maximum number of user processes and user and system sessions.

## Maximum database connections

DB engine	Parameter	Allowed values	Default value	Description
MariaDB and MySQL	max_connections	1–100000	{DBInstanceClassMemory/125} <small>125 bytes of memory per connection</small>	Number of simultaneous client connections allowed
Oracle	processes	80–20000	LEAST({DBInstanceClassMemory/125}, 20000)	Number of processes
	sessions	100–65535	–	User and system sessions
PostgreSQL	max_connections	6–8388607	LEAST({DBInstanceClassMemory/5000}, 5000)	Maximum number of concurrent connections
SQL Server	Maximum number of concurrent connections	0–32767	0 (unlimited)	Maximum number of concurrent connections

The following example shows how to calculate `max_connections` for a MariaDB or MySQL DB instance using the `db.m5.xlarge` instance class. `DBInstanceClassMemory` is 16 GiB, or 17,179,869,184 bytes. That divided by 12,582,880 = 1365 connections maximum.

For MariaDB and MySQL DB instances, setting the `max_connections` parameter to a large value might cause a DB instance to be placed in the **incompatible-parameters** status. For more information, see [Diagnosing and resolving incompatible parameters status for a memory limit \(p. 1790\)](#).

### Note

You might see fewer than the maximum number of DB connections. This is to avoid potential out-of-memory issues.

## File size limits in Amazon RDS

File size limits apply to certain Amazon RDS DB instances. For more information, see the following engine-specific limits:

- [MariaDB file size limits in Amazon RDS \(p. 588\)](#)
- [MySQL file size limits in Amazon RDS \(p. 960\)](#)
- [Oracle file size limits in Amazon RDS \(p. 1011\)](#)

# Troubleshooting for Amazon RDS

Use the following sections to help troubleshoot problems you have with DB instances in Amazon RDS and Aurora.

## Topics

- [Can't connect to Amazon RDS DB instance \(p. 1784\)](#)
- [Amazon RDS security issues \(p. 1786\)](#)
- [Resetting the DB instance owner password \(p. 1786\)](#)
- [Amazon RDS DB instance outage or reboot \(p. 1787\)](#)
- [Amazon RDS DB parameter changes not taking effect \(p. 1787\)](#)
- [Amazon RDS DB instance running out of storage \(p. 1788\)](#)
- [Amazon RDS insufficient DB instance capacity \(p. 1789\)](#)
- [MySQL and MariaDB issues \(p. 1789\)](#)
- [Can't set backup retention period to 0 \(p. 1796\)](#)

For information about debugging problems using the Amazon RDS API, see [Troubleshooting applications on Amazon RDS \(p. 1798\)](#).

## Can't connect to Amazon RDS DB instance

When you can't connect to a DB instance, the following are common causes:

- **Inbound rules** – The access rules enforced by your local firewall and the IP addresses authorized to access your DB instance might not match. The problem is most likely the inbound rules in your security group.

By default, DB instances don't allow access. Access is granted through a security group associated with the VPC that allows traffic into and out of the DB instance. If necessary, add inbound and outbound rules for your particular situation to the security group. You can specify an IP address, a range of IP addresses, or another VPC security group.

### Note

When adding a new inbound rule, you can choose **My IP** for **Source** to allow access to the DB instance from the IP address detected in your browser.

For more information about setting up security groups, see [Provide access to your DB instance in your VPC by creating a security group \(p. 69\)](#).

### Note

Client connections from IP addresses within the range 169.254.0.0/16 aren't permitted. This is the Automatic Private IP Addressing Range (APIPA), which is used for local-link addressing.

- **Public accessibility** – To connect to your DB instance from outside of the VPC, such as by using a client application, the instance must have a public IP address assigned to it.

To make the instance publicly accessible, modify it and choose **Yes** under **Public accessibility**. For more information, see [Hiding a DB instance in a VPC from the internet \(p. 1767\)](#).

- **Port** – The port that you specified when you created the DB instance can't be used to send or receive communications due to your local firewall restrictions. To determine if your network allows the

specified port to be used for inbound and outbound communication, check with your network administrator.

- **Availability** – For a newly created DB instance, the DB instance has a status of *creating* until the DB instance is ready to use. When the state changes to *available*, you can connect to the DB instance. Depending on the size of your DB instance, it can take up to 20 minutes before an instance is available.
- **Internet gateway** – For a DB instance to be publicly accessible, the subnets in its DB subnet group must have an internet gateway.

### To configure an internet gateway for a subnet

1. Sign in to the AWS Management Console and open the Amazon RDS console at <https://console.aws.amazon.com/rds/>.
2. In the navigation pane, choose **Databases**, and then choose the name of the DB instance.
3. In the **Connectivity & security** tab, write down the values of the VPC ID under **VPC** and the subnet ID under **Subnets**.
4. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
5. In the navigation pane, choose **Internet Gateways**. Verify that there is an internet gateway attached to your VPC. Otherwise, choose **Create Internet Gateway** to create an internet gateway. Select the internet gateway, and then choose **Attach to VPC** and follow the directions to attach it to your VPC.
6. In the navigation pane, choose **Subnets**, and then select your subnet.
7. On the **Route Table** tab, verify that there is a route with 0.0.0.0/0 as the destination and the internet gateway for your VPC as the target.
  - a. Choose the ID of the route table (rtb-xxxxxxx) to navigate to the route table.
  - b. On the **Routes** tab, choose **Edit routes**. Choose **Add route**, use 0.0.0.0/0 as the destination and the internet gateway as the target.
  - c. Choose **Save routes**.

For more information, see [Working with a DB instance in a VPC \(p. 1765\)](#).

For engine-specific connection issues, see the following topics:

- [Troubleshooting connections to your SQL Server DB instance \(p. 668\)](#)
- [Troubleshooting connections to your Oracle DB instance \(p. 1018\)](#)
- [Troubleshooting connections to your PostgreSQL instance \(p. 1549\)](#)
- [Maximum MySQL and MariaDB connections \(p. 1790\)](#)

## Testing a connection to a DB instance

You can test your connection to a DB instance using common Linux or Microsoft Windows tools.

From a Linux or Unix terminal, you can test the connection by entering the following (replace **DB-instance-endpoint** with the endpoint and **port** with the port of your DB instance).

```
nc -zv DB-instance-endpoint port
```

For example, the following shows a sample command and the return value.

```
nc -zv postgresql1.c6c8mn7fake0.us-west-2.rds.amazonaws.com 8299
```

```
Connection to postgresql1.c6c8mn7fake0.us-west-2.rds.amazonaws.com 8299 port [tcp/vvr-data] succeeded!
```

Windows users can use Telnet to test the connection to a DB instance. Telnet actions aren't supported other than for testing the connection. If a connection is successful, the action returns no message. If a connection isn't successful, you receive an error message such as the following.

```
C:\>telnet sg-postgresql1.c6c8mn7fake0.us-west-2.rds.amazonaws.com 819
Connecting To sg-postgresql1.c6c8mn7fake0.us-west-2.rds.amazonaws.com...Could not open
connection to the host, on port 819: Connect failed
```

If Telnet actions return success, your security group is properly configured.

**Note**

Amazon RDS doesn't accept internet control message protocol (ICMP) traffic, including ping.

## Troubleshooting connection authentication

If you can connect to your DB instance but you get authentication errors, you might want to reset the master user password for the DB instance. You can do this by modifying the RDS instance.

For more information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Amazon RDS security issues

To avoid security issues, never use your master AWS user name and password for a user account. Best practice is to use your master AWS account to create AWS Identity and Access Management (IAM) users and assign those to DB user accounts. You can also use your master account to create other user accounts, if necessary.

For more information on creating IAM users, see [Create an IAM user \(p. 66\)](#).

## Error message "failed to retrieve account attributes, certain console functions may be impaired."

You can get this error for several reasons. It might be because your account is missing permissions, or your account hasn't been properly set up. If your account is new, you might not have waited for the account to be ready. If this is an existing account, you might lack permissions in your access policies to perform certain actions such as creating a DB instance. To fix the issue, your IAM administrator needs to provide the necessary roles to your account. For more information, see [the IAM documentation](#).

## Resetting the DB instance owner password

If you get locked out of your DB instance, you can log in as the master user. Then you can reset the credentials for other administrative users or roles. If you can't log in as the master user, the AWS account owner can reset the master user password. For details of which administrative accounts or roles you might need to reset, see [Master user account privileges \(p. 1750\)](#).

You can change the DB instance password by using the Amazon RDS console, the AWS CLI command [modify-db-instance](#), or by using the [ModifyDBInstance](#) API operation. For more information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Amazon RDS DB instance outage or reboot

A DB instance outage can occur when a DB instance is rebooted. It can also occur when the DB instance is put into a state that prevents access to it, and when the database is restarted. A reboot can occur when you either manually reboot your DB instance or change a DB instance setting that requires a reboot before it can take effect.

A DB instance reboot occurs when you change a setting that requires a reboot, or when you manually cause a reboot. A reboot can occur immediately if you change a setting and request that the change take effect immediately or it can occur during the DB instance's maintenance window.

A DB instance reboot occurs immediately when one of the following occurs:

- You change the backup retention period for a DB instance from 0 to a nonzero value or from a nonzero value to 0 and set **Apply Immediately** to **true**.
- You change the DB instance class, and **Apply Immediately** is set to **true**.
- You change the storage type from **Magnetic (Standard)** to **General Purpose (SSD)** or **Provisioned IOPS (SSD)**, or from **Provisioned IOPS (SSD)** or **General Purpose (SSD)** to **Magnetic (Standard)**.

A DB instance reboot occurs during the maintenance window when one of the following occurs:

- You change the backup retention period for a DB instance from 0 to a nonzero value or from a nonzero value to 0, and **Apply Immediately** is set to **false**.
- You change the DB instance class, and **Apply Immediately** is set to **false**.

When you change a static parameter in a DB parameter group, the change doesn't take effect until the DB instance associated with the parameter group is rebooted. The change requires a manual reboot. The DB instance isn't automatically rebooted during the maintenance window.

To see a table that shows DB instance actions and the effect that setting the **Apply Immediately** value has, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## Amazon RDS DB parameter changes not taking effect

In some cases, you might change a parameter in a DB parameter group but don't see the changes take effect. If so, you likely need to reboot the DB instance associated with the DB parameter group. When you change a dynamic parameter, the change takes effect immediately. When you change a static parameter, the change doesn't take effect until you reboot the DB instance associated with the parameter group.

You can reboot a DB instance using the RDS console or explicitly calling the [RebootDBInstance](#) API operation (without failover, if the DB instance is in a Multi-AZ deployment). The requirement to reboot the associated DB instance after a static parameter change helps mitigate the risk of a parameter misconfiguration affecting an API call. An example of this might be calling [ModifyDBInstance](#) to

change the DB instance class. For more information, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

## Amazon RDS DB instance running out of storage

If your DB instance runs out of storage space, it might no longer be available. We highly recommend that you constantly monitor the `FreeStorageSpace` metric published in CloudWatch to make sure that your DB instance has enough free storage space.

If your database instance runs out of storage, its status changes to `storage-full`. For example, a call to the `DescribeDBInstances` API operation for a DB instance that has used up its storage outputs the following.

```
aws rds describe-db-instances --db-instance-identifier mydbinstance

DBINSTANCE mydbinstance 2009-12-22T23:06:11.915Z db.m5.large mysql8.0 50 sa
storage-full mydbinstance.clla4j4jgyp.us-east-1.rds.amazonaws.com 3306
us-east-1b 3
SECGROUP default active
PARAMGRP default.mysql8.0 in-sync
```

To recover from this scenario, add more storage space to your instance using the `ModifyDBInstance` API operation or the following AWS CLI command.

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
--db-instance-identifier mydbinstance \
--allocated-storage 60 \
--apply-immediately
```

For Windows:

```
aws rds modify-db-instance ^
--db-instance-identifier mydbinstance ^
--allocated-storage 60 ^
--apply-immediately
```

```
DBINSTANCE mydbinstance 2009-12-22T23:06:11.915Z db.m5.large mysql8.0 50 sa
storage-full mydbinstance.clla4j4jgyp.us-east-1.rds.amazonaws.com 3306
us-east-1b 3 60
SECGROUP default active
PARAMGRP default.mysql8.0 in-sync
```

Now, when you describe your DB instance, you see that your DB instance has `modifying` status, which indicates the storage is being scaled.

```
aws rds describe-db-instances --db-instance-identifier mydbinstance
```

```
DBINSTANCE mydbinstance 2009-12-22T23:06:11.915Z db.m5.large mysql8.0 50 sa
modifying mydbinstance.clla4j4jgyp.us-east-1.rds.amazonaws.com
3306 us-east-1b 3 60
SECGROUP default active
PARAMGRP default.mysql8.0 in-sync
```

After storage scaling is complete, your DB instance status changes to available.

```
aws rds describe-db-instances --db-instance-identifier mydbinstance
```

```
DBINSTANCE mydbinstance 2009-12-22T23:06:11.915Z db.m5.large mysql8.0 60 sa
available mydbinstance.clla4j4jgyp.us-east-1.rds.amazonaws.com 3306
us-east-1b 3
SECGROUP default active
PARAMGRP default.mysql8.0 in-sync
```

You can receive notifications when your storage space is exhausted using the `DescribeEvents` operation. For example, in this scenario, if you make a `DescribeEvents` call after these operations you see the following output.

```
aws rds describe-events --source-type db-instance --source-identifier mydbinstance
```

```
2009-12-22T23:44:14.374Z mydbinstance Allocated storage has been exhausted db-instance
2009-12-23T00:14:02.737Z mydbinstance Applying modification to allocated storage db-
instance
2009-12-23T00:31:54.764Z mydbinstance Finished applying modification to allocated storage
```

## Amazon RDS insufficient DB instance capacity

The `InsufficientDBInstanceCapacity` error can be returned when you try to create or modify a DB instance, or when you try to restore a DB instance from a DB snapshot. When this error is returned, the following are common causes:

- The specific DB instance class isn't available in the requested Availability Zone. You can try one of the following to solve the problem:
  - Retry the request with a different DB instance class.
  - Retry the request with a different Availability Zone.
  - Retry the request without specifying an explicit Availability Zone.

For information about troubleshooting instance capacity issues for Amazon EC2, see [Insufficient instance capacity](#) in the *Amazon Elastic Compute Cloud User Guide*.

- The DB instance is on the EC2-Classic platform and therefore isn't in a VPC. Some DB instance classes require a VPC. For example, if you're on the EC2-Classic platform and try to increase capacity by switching to a DB instance class that requires a VPC, this error results. For information about Amazon EC2 instance types that are only available in a VPC, see [Instance types available in EC2-Classic](#) in the *Amazon Elastic Compute Cloud User Guide*. To correct the problem, you can move the DB instance into a VPC. For more information, see [Moving a DB instance not in a VPC into a VPC \(p. 1773\)](#).

For information about modifying a DB instance, see [Modifying an Amazon RDS DB instance \(p. 251\)](#).

## MySQL and MariaDB issues

You can diagnose and correct issues with MySQL and MariaDB DB instances.

## Maximum MySQL and MariaDB connections

The maximum number of connections allowed to an RDS for MySQL or RDS for MariaDB DB instance is based on the amount of memory available for its DB instance class. A DB instance class with more memory available results in a larger number of connections available. For more information on DB instance classes, see [DB instance classes \(p. 7\)](#).

The connection limit for a DB instance is set by default to the maximum for the DB instance class. You can limit the number of concurrent connections to any value up to the maximum number of connections allowed. Use the `max_connections` parameter in the parameter group for the DB instance. For more information, see [Maximum number of database connections \(p. 1782\)](#) and [Working with DB parameter groups \(p. 229\)](#).

You can retrieve the maximum number of connections allowed for a MySQL or MariaDB DB instance by running the following query.

```
SELECT @@max_connections;
```

You can retrieve the number of active connections to a MySQL or MariaDB DB instance by running the following query.

```
SHOW STATUS WHERE `variable_name` = 'Threads_connected';
```

## Diagnosing and resolving incompatible parameters status for a memory limit

A MariaDB or MySQL DB instance can be placed in **incompatible-parameters** status for a memory limit when both of the following conditions are met:

- The DB instance is either restarted at least three time in one hour or at least five times in one day, or an attempt to restart the DB instance fails.
- The potential memory usage of the DB instance exceeds 1.2 times the memory allocated to its DB instance class.

When a DB instance is restarted for the third time in one hour or for the fifth time in one day, Amazon RDS for MySQL performs a check for memory usage. The check makes the a calculation of the potential memory usage of the DB instance. The value returned by the calculation is the sum of the following values:

- **Value 1** – The sum of the following parameters:
  - `innodb_additional_mem_pool_size`

- `innodb_buffer_pool_size`
- `innodb_log_buffer_size`
- `key_buffer_size`
- `query_cache_size` (MySQL version 5.6 and 5.7 only)
- `tmp_table_size`
- **Value 2** – The `max_connections` parameter multiplied by the sum of the following parameters:
  - `binlog_cache_size`
  - `join_buffer_size`
  - `read_buffer_size`
  - `read_rnd_buffer_size`
  - `sort_buffer_size`
  - `thread_stack`
- **Value 3** – If the `performance_schema` parameter is enabled, then multiply the `max_connections` parameter by 257700.

If the `performance_schema` parameter is disabled, then this value is zero.

So, the value returned by the calculation is the following:

`Value 1 + Value 2 + Value 3`

When this value exceeds 1.2 times the memory allocated to the DB instance class used by the DB instance, the DB instance is placed in **incompatible-parameters** status. For information about the memory allocated to DB instance classes, see [Hardware specifications for DB instance classes \(p. 33\)](#).

The calculation multiplies the value of the `max_connections` parameter by the sum of several parameters. If the `max_connections` parameter is set to a large value, it might cause the check to return an inordinately high value for the potential memory usage of the DB instance. In this case, consider lowering the value of the `max_connections` parameter.

To resolve the problem, complete the following steps:

1. Adjust the memory parameters in the DB parameter group associated with the DB instance so that the potential memory usage is lower than 1.2 times the memory allocated to its DB instance class.

For information about setting parameters, see [Modifying parameters in a DB parameter group \(p. 233\)](#).

2. Restart the DB instance.

For information about setting parameters, see [Starting an Amazon RDS DB instance that was previously stopped \(p. 250\)](#).

## Diagnosing and resolving lag between read replicas

After you create a MySQL or MariaDB read replica and the replica is available, Amazon RDS first replicates the changes made to the source DB instance from the time the read replica create operation started. During this phase, the replication lag time for the read replica is greater than 0. You can monitor this lag time in Amazon CloudWatch by viewing the Amazon RDS `ReplicaLag` metric.

The `ReplicaLag` metric reports the value of the `Seconds_Behind_Master` field of the MariaDB or MySQL `SHOW REPLICAS` command. For more information, see [SHOW REPLICAS STATUS](#). When the `ReplicaLag` metric reaches 0, the replica has caught up to the source DB instance. If the `ReplicaLag` metric returns -1, replication might not be active. To troubleshoot a replication error, see

[Diagnosing and resolving a MySQL or MariaDB read replication failure \(p. 1793\)](#). A `ReplicaLag` value of `-1` can also mean that the `Seconds_Behind_Master` value can't be determined or is `NULL`.

**Note**

Previous versions of MariaDB and MySQL used `SHOW SLAVE STATUS` instead of `SHOW REPLICAS STATUS`. If you are using a MariaDB version before 10.5 or a MySQL version before 8.0.23, then use `SHOW SLAVE STATUS`.

The `ReplicaLag` metric returns `-1` during a network outage or when a patch is applied during the maintenance window. In this case, wait for network connectivity to be restored or for the maintenance window to end before you check the `ReplicaLag` metric again.

The MySQL and MariaDB read replication technology is asynchronous. Thus, you can expect occasional increases for the `BinLogDiskUsage` metric on the source DB instance and for the `ReplicaLag` metric on the read replica. For example, consider a situation where a high volume of write operations to the source DB instance occur in parallel. At the same time, write operations to the read replica are serialized using a single I/O thread. Such a situation can lead to a lag between the source instance and read replica.

For more information about read replicas and MySQL, see [Replication implementation details](#) in the MySQL documentation. For more information about read replicas and MariaDB, see [Replication overview](#) in the MariaDB documentation.

You can reduce the lag between updates to a source DB instance and the subsequent updates to the read replica by doing the following:

- Set the DB instance class of the read replica to have a storage size comparable to that of the source DB instance.
- Make sure that parameter settings in the DB parameter groups used by the source DB instance and the read replica are compatible. For more information and an example, see the discussion of the `max_allowed_packet` parameter in the next section.
- Disable the query cache. For tables that are modified often, using the query cache can increase replica lag because the cache is locked and refreshed often. If this is the case, you might see less replica lag if you disable the query cache. You can disable the query cache by setting the `query_cache_type` parameter to `0` in the DB parameter group for the DB instance. For more information on the query cache, see [Query cache configuration](#).
- Warm the buffer pool on the read replica for InnoDB for MySQL, InnoDB for MariaDB 10.2 or higher, or XtraDB for MariaDB 10.1 or lower. For example, suppose that you have a small set of tables that are being updated often and you're using the InnoDB or XtraDB table schema. In this case, dump those tables on the read replica. Doing this causes the database engine to scan through the rows of those tables from the disk and then cache them in the buffer pool. This approach can reduce replica lag. The following shows an example.

For Linux, macOS, or Unix:

```
PROMPT> mysqldump \
-h <endpoint> \
--port=<port> \
-u=<username> \
-p <password> \
database_name table1 table2 > /dev/null
```

For Windows:

```
PROMPT> mysqldump ^
-h <endpoint> ^
--port=<port> ^
-u=<username> ^
-p <password> ^
```

```
database_name table1 table2 > /dev/null
```

## Diagnosing and resolving a MySQL or MariaDB read replication failure

Amazon RDS monitors the replication status of your read replicas and updates the **Replication State** field of the read replica instance to **Error** if replication stops for any reason. You can review the details of the associated error thrown by the MySQL or MariaDB engines by viewing the **Replication Error** field. Events that indicate the status of the read replica are also generated, including [RDS-EVENT-0045 \(p. 509\)](#), [RDS-EVENT-0046 \(p. 509\)](#), and [RDS-EVENT-0047 \(p. 508\)](#). For more information about events and subscribing to events, see [Using Amazon RDS event notification \(p. 504\)](#). If a MySQL error message is returned, check the error in the [MySQL error message documentation](#). If a MariaDB error message is returned, check the error in the [MariaDB error message documentation](#).

Common situations that can cause replication errors include the following:

- The value for the `max_allowed_packet` parameter for a read replica is less than the `max_allowed_packet` parameter for the source DB instance.

The `max_allowed_packet` parameter is a custom parameter that you can set in a DB parameter group. The `max_allowed_packet` parameter is used to specify the maximum size of data manipulation language (DML) that can be run on the database. If the `max_allowed_packet` value for the source DB instance is larger than the `max_allowed_packet` value for the read replica, the replication process can throw an error and stop replication. The most common error is `packet bigger than 'max_allowed_packet' bytes`. You can fix the error by having the source and read replica use DB parameter groups with the same `max_allowed_packet` parameter values.

- Writing to tables on a read replica. If you're creating indexes on a read replica, you need to have the `read_only` parameter set to `0` to create the indexes. If you're writing to tables on the read replica, it can break replication.
- Using a nontransactional storage engine such as MyISAM. Read replicas require a transactional storage engine. Replication is only supported for the following storage engines: InnoDB for MySQL, InnoDB for MariaDB 10.2 or higher, or XtraDB for MariaDB 10.1 or lower.

You can convert a MyISAM table to InnoDB with the following command:

```
alter table <schema>.<table_name> engine=innodb;
```

- Using unsafe nondeterministic queries such as `SYSDATE()`. For more information, see [Determination of safe and unsafe statements in binary logging](#) in the MySQL documentation.

The following steps can help resolve your replication error:

- If you encounter a logical error and you can safely skip the error, follow the steps described in [Skipping the current replication error \(p. 943\)](#). Your MySQL or MariaDB DB instance must be running a version that includes the `mysql_rds_skip_repl_error` procedure. For more information, see [mysql.rds\\_skip\\_repl\\_error \(p. 978\)](#).
- If you encounter a binary log (binlog) position issue, you can change the replica replay position with the `mysql_rds_next_master_log` command. Your MySQL or MariaDB DB instance must be running a version that supports the `mysql_rds_next_master_log` command to change the replica replay position. For version information, see [mysql.rds\\_next\\_master\\_log \(p. 979\)](#).
- If you encounter a temporary performance issue due to high DML load, you can set the `innodb_flush_log_at_trx_commit` parameter to `2` in the DB parameter group on the read replica. Doing this can help the read replica catch up, though it temporarily reduces atomicity, consistency, isolation, and durability (ACID).

- You can delete the read replica and create an instance using the same DB instance identifier. If you do this, the endpoint remains the same as that of your old read replica.

If a replication error is fixed, the **Replication State** changes to **replicating**. For more information, see [Troubleshooting a MySQL read replica problem \(p. 918\)](#).

## Creating triggers with binary logging enabled requires SUPER privilege

When trying to create triggers in an RDS for MySQL or RDS for MariaDB DB instance, you might receive the following error.

```
"You do not have the SUPER privilege and binary logging is enabled"
```

To use triggers when binary logging is enabled requires the SUPER privilege, which is restricted for RDS for MySQL and RDS for MariaDB DB instances. You can create triggers when binary logging is enabled without the SUPER privilege by setting the `log_bin_trust_function_creators` parameter to true. To set the `log_bin_trust_function_creators` to true, create a new DB parameter group or modify an existing DB parameter group.

To create a new DB parameter group that allows you to create triggers in your RDS for MySQL or RDS for MariaDB DB instance with binary logging enabled, use the following CLI commands. To modify an existing parameter group, start with step 2.

### To create a new parameter group to allow triggers with binary logging enabled using the CLI

1. Create a new parameter group.

For Linux, macOS, or Unix:

```
aws rds create-db-parameter-group \
--db-parameter-group-name allow-triggers \
--db-parameter-group-family mysql8.0 \
--description "parameter group allowing triggers"
```

For Windows:

```
aws rds create-db-parameter-group ^
--db-parameter-group-name allow-triggers ^
--db-parameter-group-family mysql8.0 ^
--description "parameter group allowing triggers"
```

2. Modify the DB parameter group to allow triggers.

For Linux, macOS, or Unix:

```
aws rds modify-db-parameter-group \
--db-parameter-group-name allow-triggers \
--parameters "ParameterName=log_bin_trust_function_creators, ParameterValue=true,
ApplyMethod=pending-reboot"
```

For Windows:

```
aws rds modify-db-parameter-group ^
```

```
--db-parameter-group-name allow-triggers ^
--parameters "ParameterName=log_bin_trust_function_creators, ParameterValue=true,
ApplyMethod=pending-reboot"
```

3. Modify your DB instance to use the new DB parameter group.

For Linux, macOS, or Unix:

```
aws rds modify-db-instance \
--db-instance-identifier mydbinstance \
--db-parameter-group-name allow-triggers \
--apply-immediately
```

For Windows:

```
aws rds modify-db-instance ^
--db-instance-identifier mydbinstance ^
--db-parameter-group-name allow-triggers ^
--apply-immediately
```

4. For the changes to take effect, manually reboot the DB instance.

```
aws rds reboot-db-instance --db-instance-identifier mydbinstance
```

## Diagnosing and resolving point-in-time restore failures

### Restoring a DB Instance That Includes Temporary Tables

When attempting a point-in-time restore (PITR) of your MySQL or MariaDB DB instance, you might encounter the following error.

```
Database instance could not be restored because there has been incompatible database
activity for restore
functionality. Common examples of incompatible activity include using temporary tables, in-
memory tables,
or using MyISAM tables. In this case, use of Temporary table was detected.
```

PITR relies on both backup snapshots and binary logs (binlogs) from MySQL or MariaDB to restore your DB instance to a particular time. Temporary table information can be unreliable in binlogs and can cause a PITR failure. If you use temporary tables in your MySQL or MariaDB DB instance, you can minimize the possibility of a PITR failure by performing more frequent backups. A PITR failure is most probable in the time between a temporary table's creation and the next backup snapshot.

### Restoring a DB Instance That Includes In-Memory Tables

You might encounter a problem when restoring a database that has in-memory tables. In-memory tables are purged during a restart. As a result, your in-memory tables might be empty after a reboot. We recommend that when you use in-memory tables, you architect your solution to handle empty tables in the event of a restart. If you're using in-memory tables with replicated DB instances, you might need to recreate the read replicas after a restart. This might be necessary if a read replica reboots and can't restore data from an empty in-memory table.

For more information about backups and PITR, see [Working with backups \(p. 330\)](#) and [Restoring a DB instance to a specified time \(p. 392\)](#).

## Replication stopped error

When you call the `mysql.rds_skip_repl_error` command, you might receive an error message stating that replication is down or disabled.

This error message appears because replication is stopped and can't be restarted.

If you need to skip a large number of errors, the replication lag can increase beyond the default retention period for binary log files. In this case, you might encounter a fatal error due to binary log files being purged before they have been replayed on the replica. This purge causes replication to stop, and you can no longer call the `mysql.rds_skip_repl_error` command to skip replication errors.

You can mitigate this issue by increasing the number of hours that binary log files are retained on your replication source. After you have increased the binlog retention time, you can restart replication and call the `mysql.rds_skip_repl_error` command as needed.

To set the binlog retention time, use the [mysql.rds\\_set\\_configuration \(p. 982\)](#) procedure. Specify a configuration parameter of 'binlog retention hours' along with the number of hours to retain binlog files on the DB cluster, up to 720 (30 days). The following example sets the retention period for binlog files to 48 hours.

```
CALL mysql.rds_set_configuration('binlog retention hours', 48);
```

## Read replica create fails or replication breaks with fatal error 1236

After changing default parameter values for a MySQL or MariaDB DB instance, you might encounter one of the following problems:

- You can't create a read replica for the DB instance.
- Replication fails with `fatal error 1236`.

Some default parameter values for MySQL and MariaDB DB instances help to make sure that the database is ACID compliant and read replicas are crash-safe. They do this by making sure that each commit is fully synchronized by writing the transaction to the binary log before it's committed. Changing these parameters from their default values to improve performance can cause replication to fail when a transaction hasn't been written to the binary log.

To resolve this issue, set the following parameter values:

- `sync-binlog = 1`
- `innodb_support_xa = 1`
- `innodb_flush_log_at_trx_commit = 1`

## Can't set backup retention period to 0

There are several reasons why you might need to set the backup retention period to 0. For example, you can disable automatic backups immediately by setting the retention period to 0.

In some cases, you might set the value to 0 and receive a message saying that the retention period must be between 1 and 35. In these cases, check to make sure that you haven't set up a read replica for the instance. Read replicas require backups for managing read replica logs, and therefore you can't set a retention period of 0.

# Amazon RDS application programming interface (API) reference

In addition to the AWS Management Console, and the AWS Command Line Interface (AWS CLI), Amazon Relational Database Service (Amazon RDS) also provides an application programming interface (API). You can use the API to automate tasks for managing your DB instances and other objects in Amazon RDS.

- For an alphabetical list of API operations, see [Actions](#).
- For an alphabetical list of data types, see [Data types](#).
- For a list of common query parameters, see [Common parameters](#).
- For descriptions of the error codes, see [Common errors](#).

For more information about the AWS CLI, see [AWS Command Line Interface reference for Amazon RDS](#).

## Topics

- [Using the Query API \(p. 1797\)](#)
- [Troubleshooting applications on Amazon RDS \(p. 1798\)](#)

## Using the Query API

The following sections briefly discuss the parameters and request authentication used with the Query API.

For general information about how the Query API works, see [Query requests](#) in the *Amazon EC2 API Reference*.

## Query parameters

HTTP Query-based requests are HTTP requests that use the HTTP verb GET or POST and a Query parameter named `Action`.

Each Query request must include some common parameters to handle authentication and selection of an action.

Some operations take lists of parameters. These lists are specified using the `param.n` notation. Values of *n* are integers starting from 1.

For information about Amazon RDS regions and endpoints, go to [Amazon Relational Database Service \(RDS\)](#) in the Regions and Endpoints section of the *Amazon Web Services General Reference*.

## Query request authentication

You can only send Query requests over HTTPS, and you must include a signature in every Query request. You must use either AWS signature version 4 or signature version 2. For more information, see [Signature Version 4 signing process](#) and [Signature version 2 signing process](#).

# Troubleshooting applications on Amazon RDS

Amazon RDS provides specific and descriptive errors to help you troubleshoot problems while interacting with the Amazon RDS API.

## Topics

- [Retrieving errors \(p. 1798\)](#)
- [Troubleshooting tips \(p. 1798\)](#)

For information about troubleshooting for Amazon RDS DB instances, see [Troubleshooting for Amazon RDS \(p. 1784\)](#).

## Retrieving errors

Typically, you want your application to check whether a request generated an error before you spend any time processing results. The easiest way to find out if an error occurred is to look for an `Error` node in the response from the Amazon RDS API.

XPath syntax provides a simple way to search for the presence of an `Error` node, as well as an easy way to retrieve the error code and message. The following code snippet uses Perl and the `XML::XPath` module to determine if an error occurred during a request. If an error occurred, the code prints the first error code and message in the response.

```
use XML::XPath;
my $xp = XML::XPath->new(xml =>$response);
if ($xp->find("//Error"))
{print "There was an error processing your request:\n", " Error code: ",
$xp->findvalue("//Error[1]/Code"), "\n", " ",
$xp->findvalue("//Error[1]/Message"), "\n\n"; }
```

## Troubleshooting tips

We recommend the following processes to diagnose and resolve problems with the Amazon RDS API.

- Verify that Amazon RDS is operating normally in the AWS Region you are targeting by visiting <http://status.aws.amazon.com>.
- Check the structure of your request

Each Amazon RDS operation has a reference page in the *Amazon RDS API Reference*. Double-check that you are using parameters correctly. In order to give you ideas regarding what might be wrong, look at the sample requests or user scenarios to see if those examples are doing similar operations.

- Check the forum

Amazon RDS has a development community forum where you can search for solutions to problems others have experienced along the way. To view the forum, go to

<https://forums.aws.amazon.com/>

# Document history

**Current API version:** 2014-10-31

The following table describes important changes in each release of the *Amazon RDS User Guide* after May 2018. For notification about updates to this documentation, you can subscribe to an RSS feed.

update-history-change	update-history-description	update-history-date
<a href="#">Amazon RDS on Outposts supports additional RDS for PostgreSQL versions (p. 1799)</a>	RDS on Outposts now supports RDS for PostgreSQL versions 12.5, 12.6, 13.1, and 13.2. For more information, see <a href="#">Amazon RDS on AWS Outposts support for Amazon RDS features</a> .	May 28, 2021
<a href="#">Amazon RDS for Oracle includes the April 2021 PSU for Oracle Database 12c Release 1 (12.1.0.2) (p. 1799)</a>	Amazon RDS has released the 12.1.0.2.v24 patch set update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	May 28, 2021
<a href="#">Support for MariaDB 10.2.37 and 10.3.28 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB versions 10.2.37 and 10.3.28. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	May 27, 2021
<a href="#">Amazon RDS for Oracle supports multitenant container database (CDB) (p. 1799)</a>	A multitenant architecture enables an Oracle database to be a CDB. In Oracle Database 19c, your CDB can include a single PDB. The user experience with a PDB is mostly identical to the user experience with a non-CDB. For more information, see <a href="#">RDS for Oracle architecture</a> .	May 25, 2021
<a href="#">Amazon RDS for Oracle April 2021 RU and RUR (p. 1799)</a>	Amazon RDS for Oracle has released database engine versions 19.0.0.0.ru-2021-04.rur-2021-04.r1, 18.0.0.0.ru-2021-04.rur-2021-04.r1, and 12.2.0.1.ru-2021-04.rur-2021-04.r1 to support the April 2021 Release Update (RU) and Release Update Revision (RUR). For more information, see <a href="#">Oracle database engine release notes</a> .	May 21, 2021
<a href="#">Amazon RDS on Outposts supports Amazon RDS for SQL Server (p. 1799)</a>	RDS on Outposts now supports Amazon RDS for SQL Server. For more information, see <a href="#">Amazon</a>	May 11, 2021

RDS on AWS Outposts support for Amazon RDS features.		
Amazon RDS extends support for cross-Region automated backups (p. 1799)	You can now configure Amazon RDS database instances running Microsoft SQL Server to replicate DB snapshots and transaction logs to a different AWS Region. For more information, see <a href="#">Replicating automated backups to another AWS Region</a> .	May 7, 2021
Amazon RDS supports cross-Region automated backups for encrypted DB instances (p. 1799)	You can now replicate DB snapshots and transaction logs to a different AWS Region for encrypted Amazon RDS database instances running Oracle or PostgreSQL. For more information, see <a href="#">Replicating automated backups to another AWS Region</a> .	May 3, 2021
Amazon RDS on Outposts supports Amazon CloudWatch monitoring (p. 1799)	RDS on Outposts now supports Amazon CloudWatch monitoring. For more information, see <a href="#">Amazon RDS on AWS Outposts support for Amazon RDS features</a> .	April 21, 2021
RDS for PostgreSQL supports Lambda functions (p. 1799)	You can now invoke AWS Lambda functions for your RDS for PostgreSQL DB instances. For more information, see <a href="#">Invoking an AWS Lambda function from an RDS for PostgreSQL DB instance</a> .	April 13, 2021
Amazon RDS for PostgreSQL versions 13.2, 12.6, 11.11, 10.16, 9.6.21, and 9.5.25 (p. 1799)	Amazon RDS for PostgreSQL now supports versions 13.2, 12.6, 11.11, 10.16, 9.6.21, and 9.5.25. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	April 13, 2021
RDS for SQL Server supports extended events (p. 1799)	You can use SQL Server extended events to capture debugging and troubleshooting information. For more information, see <a href="#">Using extended events with Amazon RDS for Microsoft SQL Server</a> .	April 8, 2021
Support for MySQL 8.0.23, 5.7.33, and 5.6.51 (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 8.0.23, 5.7.33, and 5.6.51. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	March 31, 2021

<a href="#">Automatic rollback on failed Amazon RDS for MySQL upgrade (p. 1799)</a>	If a DB instance upgrade from MySQL version 5.7 to MySQL version 8.0 fails, Amazon RDS rolls back the changes performed for the upgrade automatically. After the rollback, the MySQL DB instance is running MySQL version 5.7. For more information, see <a href="#">Rollback after failure to upgrade from MySQL 5.7 to 8.0</a> .	March 18, 2021
<a href="#">Amazon RDS supports cross-Region read replicas in opt-in Regions (p. 1799)</a>	You can now replicate DB instances to opt-in Regions. For more information, see <a href="#">Creating a read replica in a different AWS Region</a> .	March 18, 2021
<a href="#">Amazon RDS for Oracle includes the January 2021 PSU for release 12.1.0.2 (p. 1799)</a>	Amazon RDS has released a database engine update for Oracle Database 12c Release 1 (12.1.0.2). Also, Amazon RDS has released database version 19.0.0.0.ru-2021-01.rur-2021-01.r2, which we recommend as an alternative to 19.0.0.0.ru-2021-01.rur-2021-01.r1. For more information, see <a href="#">Oracle database engine release notes</a> .	March 18, 2021
<a href="#">Amazon RDS plans to deprecate Oracle Database 18c (p. 1799)</a>	Oracle Database 18c (18.0.0.0) is on a deprecation path. Oracle Corporation will no longer provide patches for Oracle Database 18c after the end-of-support date. On July 1, 2021, Amazon RDS plans to begin automatically upgrading Oracle Database 18c instances to Oracle Database 19c. Before the automatic upgrades begin, we highly recommend that you manually upgrade your existing Oracle Database 18c instances to Oracle Database 19c. For more information, see <a href="#">Preparing for the automatic upgrade of Oracle Database 18c</a> .	March 11, 2021
<a href="#">Amazon RDS has ended support for Oracle Database 11g (p. 1799)</a>	You can only create DB instances for Oracle Database 12c Release 1 (12.1.0.2) and later. If you have Oracle Database 11g snapshots, upgrade them to a later release. For more information, see <a href="#">Upgrading an Oracle DB snapshot</a> .	March 11, 2021

Amazon RDS supports continuous backups of DB instances in (p. 1799)	You can now create automated backups in AWS Backup and restore DB instances from these backups to a specified time. For more information, see <a href="#">Using AWS Backup to manage automated backups</a> .	March 10, 2021
Amazon RDS for Oracle supports Oracle Management Agent (OMA) version 13.4 (p. 1799)	You can use Oracle Management Agent (OMA) version 13.4 with Oracle Enterprise Manager (OEM) Cloud Control 13c Release 4 Update 9. Amazon RDS for Oracle installs OMA, which then communicates with your Oracle Management Service (OMS) to provide monitoring information. If you run OMS 13.4, you can manage databases by installing OMA 13.4. For more information, see <a href="#">Oracle Management Agent for Enterprise Manager Cloud Control</a> .	March 10, 2021
RDS Proxy endpoint enhancements (p. 1799)	You can create additional endpoints associated with each RDS proxy. Creating an endpoint in a different VPC enables cross-VPC access for the proxy. Proxies for Aurora MySQL clusters can also have read-only endpoints. These reader endpoints connect to reader DB instances in the clusters and can improve read scalability and availability for query-intensive applications. For more information about RDS Proxy, see "Managing Connections with Amazon RDS Proxy" in the <a href="#">Amazon RDS User Guide</a> or the <a href="#">Aurora user guide</a> .	March 8, 2021
Amazon RDS extends supports for cross-Region automated backups (p. 1799)	You can now configure Amazon RDS database instances running PostgreSQL to replicate DB snapshots and transaction logs to a different AWS Region. For more information, see <a href="#">Replicating automated backups to another AWS Region</a> .	March 8, 2021

Replication filters for Amazon RDS for MariaDB and MySQL supported in the China (Beijing) Region and China (Ningxia) Region (p. 1799)	Replication filtering is now supported in the China (Beijing) Region and China (Ningxia) Region. For more information, see <a href="#">Configuring replication filters with MariaDB</a> and <a href="#">Configuring replication filters with MySQL</a> .	March 5, 2021
Amazon RDS supports cross-Region DB snapshot copy in opt-in Regions (p. 1799)	You can now copy DB snapshots to and from opt-in AWS Regions. For more information, see <a href="#">Copying snapshots across AWS Regions</a> .	March 4, 2021
Amazon RDS for PostgreSQL version 13.1 (p. 1799)	Amazon RDS for PostgreSQL now supports version 13.1. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	February 24, 2021
Amazon RDS for SQL Server supports Always On Availability Groups for Standard Edition (p. 1799)	When you create a DB instance using the Multi-AZ configuration on SQL Server 2019 for the Standard Edition database engine, RDS automatically uses Availability Groups. For more information, see <a href="#">Multi-AZ deployments for Microsoft SQL Server</a> .	February 23, 2021
Amazon RDS for Oracle introduces advisor-related procedures (p. 1799)	The <code>rdsadmin_util</code> package includes the procedures <code>advisor_task_set_parameter</code> , <code>advisor_task_drop</code> , and <code>dbms_stats_init</code> . You can use these procedures to modify, stop, and re-enable advisor tasks such as <code>AUTO_STATS_ADVISOR_TASK</code> . For more information, see <a href="#">Setting parameters for advisor tasks</a> .	February 23, 2021
Amazon RDS for Oracle includes January 2021 RU, RUR, and PSU updates (p. 1799)	Amazon RDS has released database engine updates for Oracle Database versions 12.2, 18c, and 19c. For more information, see <a href="#">Oracle database engine release notes</a> .	February 22, 2021
Amazon RDS provides failover reasons for Multi-AZ DB instances (p. 1799)	You can now see more detailed explanations when a Multi-AZ DB instance fails over to a standby replica. For more information, see <a href="#">Failover process for Amazon RDS</a> .	February 18, 2021

Amazon RDS extends support for exporting snapshots to Amazon S3 (p. 1799)	You can now export DB snapshot data to Amazon S3 in China. For more information, see <a href="#">Exporting DB snapshot data to Amazon S3</a> .	February 17, 2021
Replication filters for Amazon RDS for MariaDB and MySQL (p. 1799)	You can configure replication filters for MySQL and MariaDB instances. Replication filters specify which databases and tables are replicated in a read replica. You can create lists of databases and tables to include or exclude for each read replica. For more information, see <a href="#">Configuring replication filters with MariaDB</a> and <a href="#">Configuring replication filters with MySQL</a> .	February 12, 2021
RDS for Oracle supports APEX 20.2v1 (p. 1799)	You can use APEX 20.2.v1 with all supported versions of Oracle Database. For more information, see <a href="#">Oracle Application Express</a> .	February 2, 2021
Amazon RDS for SQL Server supports local instance storage for the tempdb database (p. 1799)	You can now launch Amazon RDS for SQL Server on Amazon EC2 db.r5d and db.m5d instance types with the tempdb database configured to use an instance store. By placing tempdb data files and log files locally, you can achieve lower read and write latencies when compared to standard storage based on Amazon EBS. For more information, see <a href="#">Instance store support for the tempdb database on Amazon RDS for SQL Server</a> .	January 27, 2021
Amazon RDS for PostgreSQL versions 12.5, 11.10, 10.15, 9.6.20, and 9.5.24 (p. 1799)	Amazon RDS for PostgreSQL now supports versions 12.5, 11.10, 10.15, 9.6.20, and 9.5.24. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	January 12, 2021
Amazon RDS for PostgreSQL supports pg_partman and pg_cron (p. 1799)	Amazon RDS for PostgreSQL now supports the pg_partman and pg_cron extensions. For more information on the pg_partman extension, see <a href="#">Managing PostgreSQL partitions with the pg_partman extension</a> . For more information on the pg_cron extension, see <a href="#">Scheduling maintenance with the PostgreSQL pg_cron extension</a> .	January 12, 2021

<a href="#">Amazon RDS supports publishing the Oracle Management Agent log to Amazon CloudWatch Logs (p. 1799)</a>	The Oracle Management Agent log consists of emctl.log, emdctlj.log, gcagent.log, gcagent_errors.log, emagent.nohup, and secure.log. Amazon RDS publishes each of these logs as a separate CloudWatch log stream. For more information, see <a href="#">Publishing Oracle logs to Amazon CloudWatch Logs</a> .	December 28, 2020
<a href="#">Amazon RDS on Outposts supports additional database versions (p. 1799)</a>	RDS on Outposts now supports additional MySQL and PostgreSQL versions. For more information, see <a href="#">Amazon RDS on AWS Outposts support for Amazon RDS features</a> .	December 23, 2020
<a href="#">Amazon RDS on Outposts supports ColPs (p. 1799)</a>	RDS on Outposts now supports customer-owned IP addresses (ColPs). ColPs provide local or external connectivity to resources in your Outpost subnets through your on-premises network. For more information, see <a href="#">Customer-owned IP addresses for RDS on Outposts</a> .	December 22, 2020
<a href="#">Amazon RDS for Oracle includes the October 2020 PSU for Oracle Database 11g (p. 1799)</a>	Amazon RDS for Oracle has released database engine updates for Oracle Database 11g Enterprise Edition. For more information, see <a href="#">Oracle database engine release notes</a> .	December 21, 2020
<a href="#">Amazon RDS for Oracle plans upgrade of 11g BYOL instances to 19c (p. 1799)</a>	On January 4, 2021, we plan to begin automatically upgrading all editions of Oracle Database 11g instances on the Bring Your Own License (BYOL) model to Oracle Database 19c. All Oracle Database 11g instances, including reserved instances, will move to the latest available Release Update (RU). For more information, see <a href="#">Preparing for the automatic upgrade of Oracle Database 11g BYOL</a> .	December 11, 2020

<a href="#">Amazon RDS supports replicating automated backups to another Region (p. 1799)</a>	You can now configure your Amazon RDS database instances to replicate snapshots and transaction logs to a destination AWS Region of your choice. For more information, see <a href="#">Replicating automated backups to another AWS Region</a> .	December 4, 2020
<a href="#">Amazon RDS for Oracle and Microsoft SQL Server support a new DB instance class (p. 1799)</a>	You can now use the db.r5b instance class to create Amazon RDS DB instances running Oracle or SQL Server. For more information, see <a href="#">Supported DB engines for DB instance classes</a> .	December 4, 2020
<a href="#">Support for MariaDB 10.2.32 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.2.32. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	November 25, 2020
<a href="#">Amazon RDS for SQL Server supports the Microsoft Business Intelligence Suite on SQL Server 2019 (p. 1799)</a>	You can now run SQL Server Analysis Services, SQL Server Integration Services, and SQL Server Reporting Services on DB instances using the latest major version. For more information, see <a href="#">Options for the Microsoft SQL Server database engine</a> .	November 24, 2020
<a href="#">Amazon RDS for PostgreSQL version 13 in the database preview environment (p. 1799)</a>	Amazon RDS for PostgreSQL now supports PostgreSQL version 13 in the database preview environment. For more information, see <a href="#">PostgreSQL 13 versions</a> .	November 24, 2020
<a href="#">Amazon RDS for Oracle includes October 2020 RU, RUR, and PSU updates (p. 1799)</a>	Amazon RDS for Oracle has released database engine updates for all versions except 11.2. Also, Amazon RDS for Oracle provides support for setting and unsetting system diagnostic events using the <code>rdsadmin.rdsadmin_util</code> package, and troubleshooting a GoldenGate error using the procedure <code>rdsadmin_util.truncate_apply\$_cdr_info</code> . For more information, see <a href="#">Oracle database engine release notes</a> .	November 24, 2020

Amazon RDS Performance Insights introduces new dimensions (p. 1799)	You can group database load according to the dimension groups for database (PostgreSQL, MySQL, and MariaDB), application (PostgreSQL), and session type (PostgreSQL). Amazon RDS also supports the dimensions db.name (PostgreSQL, MySQL, and MariaDB), db.application.name (PostgreSQL), and db.session_type.name (PostgreSQL). For more information, see <a href="#">Top load table</a> .	November 24, 2020
Amazon RDS for MariaDB supports a new major version (p. 1799)	You can now create Amazon RDS DB instances running MariaDB version 10.5. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	November 23, 2020
Support for MySQL 5.6.49 (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 5.6.49. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	November 20, 2020
Support for MySQL 5.5.62 (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 5.5.62. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	November 20, 2020
Performance Insights supports analyzing statistics for running PostgreSQL queries (p. 1799)	You can now analyze statistics for running queries with Performance Insights for PostgreSQL DB instances. For more information, see <a href="#">Statistics for PostgreSQL</a> .	November 18, 2020
Amazon RDS extends support for storage autoscaling (p. 1799)	You can now enable storage autoscaling when creating a read replica, restoring a DB instance to a specified time, or restoring a MySQL DB instance from an Amazon S3 backup. For more information, see <a href="#">Managing capacity automatically with Amazon RDS storage autoscaling</a> .	November 18, 2020

Amazon RDS for SQL Server supports Database Mail (p. 1799)	With Database Mail you can send email messages from your Amazon RDS for SQL Server database instance. After specifying the email recipients, you can add files or query results to the message you send. For more information, see <a href="#">Using Database Mail on Amazon RDS for SQL Server</a> .	November 4, 2020
Support for MySQL 8.0.21 (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 8.0.21. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	October 22, 2020
Amazon RDS extends support for exporting snapshots to Amazon S3 (p. 1799)	You can now export DB snapshot data to Amazon S3 in all commercial AWS Regions. For more information, see <a href="#">Exporting DB snapshot data to Amazon S3</a> .	October 22, 2020
Amazon RDS for PostgreSQL supports read replica upgrades (p. 1799)	With Amazon RDS for PostgreSQL, when you do a major version upgrade of the primary DB instance, read replicas are also automatically upgraded. For more information, see <a href="#">Upgrading the PostgreSQL DB engine</a> .	October 15, 2020
Amazon RDS for MariaDB, MySQL and PostgreSQL support the Graviton2 DB instance classes (p. 1799)	You can now use the Graviton2 DB instance classes db.m6g.x and db.r6g.x to create Amazon RDS DB instances running MariaDB, MySQL or PostgreSQL. For more information, see <a href="#">Supported DB Engines for All Available DB Instance Classes</a> .	October 15, 2020
Amazon RDS for SQL Server supports upgrades to SQL Server 2019 (p. 1799)	You can upgrade your SQL Server DB instances to SQL Server 2019. For more information, see <a href="#">Upgrading the Microsoft SQL Server DB Engine</a> .	October 6, 2020
Amazon RDS for Oracle supports specifying the national character set (p. 1799)	The national character set, also called the NCHAR character set, is used in the NCHAR, NVARCHAR2, and NCLOB data types. When you create a database, you can specify either AL16UTF16 (default) or UTF8 as the NCHAR character set. For more information, see <a href="#">Oracle character sets supported in Amazon RDS</a> .	October 2, 2020

<a href="#">Support for MySQL 5.7.31 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 5.7.31. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	October 1, 2020
<a href="#">Amazon RDS for PostgreSQL supports exporting data to Amazon S3 (p. 1799)</a>	You can query data from a PostgreSQL DB instance and export it directly into files stored in an Amazon S3bucket. For more information, see <a href="#">Exporting data from an RDS for PostgreSQL DB instance to Amazon S3</a> .	September 24, 2020
<a href="#">Amazon RDS for PostgreSQL 12.4, 11.9, 10.14, 9.6.19, and 9.5.23 (p. 1799)</a>	Amazon RDS for PostgreSQL supports versions 12.4, 11.9, 10.14, 9.6.19, and 9.5.23. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	September 24, 2020
<a href="#">Amazon RDS for MySQL 8.0 supports Percona XtraBackup (p. 1799)</a>	You can now use Percona XtraBackup to restore a backup into an Amazon RDS for MySQL 8.0 DB instance. For more information, see <a href="#">Restoring a backup into a MySQL DB instance</a> .	September 17, 2020
<a href="#">Amazon RDS for SQL Server supports native backup and restore on DB instances with read replicas (p. 1799)</a>	You can restore a SQL Server native backup onto a DB instance that has read replicas configured. For more information, see <a href="#">Importing and exporting SQL Server databases</a> .	September 16, 2020
<a href="#">Amazon RDS for SQL Server supports additional time zones (p. 1799)</a>	You can match your DB instance time zone with your chosen time zone. For more information, see <a href="#">Local time zone for Microsoft SQL Server DB instances</a> .	September 11, 2020
<a href="#">Amazon RDS for PostgreSQL version 13 beta 3 in the database preview environment (p. 1799)</a>	Amazon RDS for PostgreSQL now supports PostgreSQL Version 13 Beta 3 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL 13 versions</a> .	September 9, 2020
<a href="#">RDS for Oracle includes July 2020 RU, RUR, and PSU updates (p. 1799)</a>	Amazon RDS for Oracle has released database engine updates for July 2020. For more information, see <a href="#">Oracle database engine release notes</a> .	August 28, 2020

Amazon RDS for SQL Server supports trace flag 692 (p. 1799)	You can now use trace flag 692 as a startup parameter using DB parameter groups. Enabling this trace flag disables fast inserts while bulk loading data into heap or clustered indexes. For more information, see <a href="#">Disabling fast inserts during bulk loading</a> .	August 27, 2020
Amazon RDS for SQL Server supports Microsoft SQL Server 2019 (p. 1799)	You can now create RDS DB instances that use SQL Server 2019. For more information, see <a href="#">Microsoft SQL Server versions on Amazon RDS</a> .	August 26, 2020
RDS for Oracle supports mounted replica database (p. 1799)	When creating or modifying an Oracle replica, you can place it in mounted mode. Because the replica database doesn't accept user connections, it can't serve a read-only workload. The mounted replica deletes archived redo log files after it applies them. The primary use for mounted replicas is cross-Region disaster recovery. For more information, see <a href="#">Overview of Oracle replicas</a> .	August 13, 2020
RDS for Oracle plans upgrade of 11g SE1 LI instances (p. 1799)	On November 1, 2020, we plan to begin automatically upgrading Oracle Database 11g SE1 License Included (LI) instances to Oracle Database 19c for Amazon RDS for Oracle. All 11g instances, including reserved instances, will move to the latest available Oracle Release Update (RU). For more information, see <a href="#">Preparing for the automatic upgrade of Oracle Database 11g SE1</a> .	July 31, 2020
Amazon RDS supports new Graviton2 DB instance classes in preview release for PostgreSQL and MySQL (p. 1799)	You can now create Amazon RDS DB instances running PostgreSQL or MySQL that use the db.m6g.x and db.r6g.x DB instance classes. For more information, see <a href="#">Supported DB engines for all available DB instance classes</a> .	July 30, 2020
RDS for Oracle supports APEX 20.1v1 (p. 1799)	You can use APEX 20.1v1 with all supported versions of Oracle Database. For more information, see <a href="#">Oracle application Express</a> .	July 28, 2020

<a href="#">Support for MySQL 8.0.20 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 8.0.20. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	July 23, 2020
<a href="#">Amazon RDS for MariaDB and MySQL support new DB instance classes (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB and MySQL that use the db.m5.16xlarge, db.m5.8xlarge, db.r5.16xlarge, and db.r5.8xlarge DB instance classes. For more information, see <a href="#">Supported DB engines for all available DB instance classes</a> .	July 23, 2020
<a href="#">RDS for SQL Server supports disabling old versions of TLS and ciphers (p. 1799)</a>	You can turn certain security protocols and ciphers on and off. For more information, see <a href="#">Configuring security protocols and ciphers</a> .	July 21, 2020
<a href="#">RDS supports Oracle Spatial on SE2 (p. 1799)</a>	You can use Oracle Spatial in Standard Edition 2 (SE2) for all versions of 12.2, 18c, and 19c. For more information, see <a href="#">Oracle Spatial</a> .	July 9, 2020
<a href="#">Amazon RDS supports PrivateLink (p. 1799)</a>	Amazon RDS now supports creating Amazon VPC endpoints for Amazon RDS API calls to keep traffic between applications and Amazon RDS in the AWS network. For more information, see <a href="#">Amazon RDS and interface VPC endpoints (AWS PrivateLink)</a> .	July 9, 2020
<a href="#">Amazon RDS for PostgreSQL versions 9.4.x are deprecated (p. 1799)</a>	Amazon RDS for PostgreSQL no longer supports versions 9.4.x. For supported versions, see <a href="#">Supported PostgreSQL database versions</a> .	July 8, 2020
<a href="#">Support for MariaDB 10.3.23 and 10.4.13 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.3.23 and 10.4.13. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	July 6, 2020
<a href="#">Amazon RDS on Outposts (p. 1799)</a>	You can create Amazon RDS DB instances on AWS Outposts. For more information, see <a href="#">Working with Amazon RDS on AWS Outposts</a> .	July 6, 2020

<a href="#">Amazon RDS for Oracle creates inventory files automatically (p. 1799)</a>	To open service requests for BYOL customers, Oracle Support requests inventory files generated by Opatch. Amazon RDS for Oracle automatically creates inventory files every hour in the BDUMP directory. For more information, see <a href="#">Accessing Opatch files</a> .	July 6, 2020
<a href="#">Support for MySQL 5.7.30 and 5.6.48 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 5.7.30 and 5.6.48. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	June 25, 2020
<a href="#">Amazon RDS for PostgreSQL supports PostgreSQL 12.3 (p. 1799)</a>	Amazon RDS for PostgreSQL supports version 12.3. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	June 17, 2020
<a href="#">Amazon RDS for Oracle supports ADRCI (p. 1799)</a>	The Automatic Diagnostic Repository Command Interpreter (ADRCI) utility is an Oracle command-line tool that you use to manage diagnostic data. By using the functions in the Amazon RDS package <code>rdsadmin_adrci_util</code> , you can list and package problems and incidents, and also show trace files. For more information, see <a href="#">Common DBA diagnostic tasks for Oracle DB instances</a> .	June 17, 2020
<a href="#">Support for MySQL 8.0.19 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 8.0.19. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	June 2, 2020
<a href="#">MySQL 8.0 supports lower case table names (p. 1799)</a>	You can now set the <code>lower_case_table_names</code> parameter to 1 for Amazon RDS DB instances running MySQL version 8.0.19 and higher 8.0 versions. For more information, see <a href="#">MySQL parameter exceptions for Amazon RDS DB instances</a> .	June 2, 2020

Amazon RDS for Microsoft SQL Server supports SQL Server Integration Services (SSIS) (p. 1799)	SSIS is a platform for data integration and workflow applications. You can enable SSIS on existing or new DB instances. It's installed on the same DB instance as your database engine. For more information, see <a href="#">Support for SQL Server Integration Services in SQL Server</a> .	May 19, 2020
Amazon RDS for Microsoft SQL Server supports SQL Server Reporting Services (SSRS) (p. 1799)	SSRS is a server-based application used for report generation and distribution. You can enable SSRS on existing or new DB instances. It's installed on the same DB instance as your database engine. For more information, see <a href="#">Support for SQL Server Reporting Services in SQL Server</a> .	May 15, 2020
Amazon RDS for Microsoft SQL Server supports S3 integration on Multi-AZ instances (p. 1799)	You can now use Amazon S3 with SQL Server features such as bulk insert on Multi-AZ DB instances. For more information, see <a href="#">Integrating an Amazon RDS for SQL Server DB instance with Amazon S3</a> .	May 15, 2020
Amazon RDS for Oracle supports purging the recycle bin (p. 1799)	The <code>rdsadmin.rdsadmin_util.purge_dba_recyclebin</code> procedure purges the recycle bin. For more information, see <a href="#">Purging the recycle bin</a> .	May 13, 2020
Amazon RDS for Oracle improves manageability of Automatic Workload Repository (AWR) (p. 1799)	The <code>rdsadmin.rdsadmin_diagnostic_util</code> procedures generate AWR reports and extract AWR data into dump files. For more information, see <a href="#">Generating performance reports with Automatic Workload Repository (AWR)</a> .	May 13, 2020
Amazon RDS for Oracle April 2020 RU, RUR, and PSU (p. 1799)	Amazon RDS for Oracle has released database engine updates for April 2020. For more information, see <a href="#">Oracle database engine release notes</a> .	May 13, 2020

Amazon RDS for Microsoft SQL Server supports Microsoft Distributed Transaction Coordinator (MSDTC) (p. 1799)	Amazon RDS for SQL Server supports distributed transactions between hosts. For more information, see <a href="#">Support for Microsoft Distributed Transaction Coordinator in SQL Server</a> .	May 4, 2020
Amazon RDS for PostgreSQL versions 11.7, 10.12, 9.6.17, and 9.5.21 (p. 1799)	Amazon RDS for PostgreSQL supports versions 11.7, 10.12, 9.6.17, and 9.5.21. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	April 28, 2020
Amazon RDS for Microsoft SQL Server supports new versions (p. 1799)	You can now create Amazon RDS DB instances running SQL Server versions 2017 CU19 14.00.3281.6, 2016 SP2 CU11 13.00.5598.27, 2014 SP3 CU4 12.00.6329.1, and 2012 SP4 GDR 11.0.7493.4 for all editions. For more information, see <a href="#">Microsoft SQL Server versions on Amazon RDS</a> .	April 28, 2020
Amazon RDS available in the Europe (Milan) Region (p. 1799)	Amazon RDS is now available in the Europe (Milan) Region. For more information, see <a href="#">Regions and Availability Zones</a> .	April 28, 2020
Amazon RDS support for Local Zones (p. 1799)	You can now launch DB instances into a Local Zone subnet. For more information, see <a href="#">Regions, Availability Zones, and Local Zones</a> .	April 23, 2020
Amazon RDS available in the Africa (Cape Town) Region (p. 1799)	Amazon RDS is now available in the Africa (Cape Town) Region. For more information, see <a href="#">Regions and Availability Zones</a> .	April 22, 2020
Amazon RDS for Microsoft SQL Server supports SQL Server Analysis Services (SSAS) (p. 1799)	SSAS is an online analytical processing (OLAP) and data mining tool that is installed within SQL Server. You can enable SSAS on existing or new DB instances. It's installed on the same DB instance as your database engine. For more information, see <a href="#">Support for SQL Server Analysis Services in SQL Server</a> .	April 17, 2020

<a href="#">Amazon RDS proxy for PostgreSQL (p. 1799)</a>	Amazon RDS Proxy is now available for PostgreSQL. You can use RDS Proxy to reduce the overhead of connection management on your DB instance and also the chance of "too many connections" errors. The RDS Proxy is currently in public preview for PostgreSQL. For more information, see <a href="#">Managing connections with Amazon RDS proxy (preview)</a> .	April 8, 2020
<a href="#">Amazon RDS for Oracle supports Oracle APEX version 19.2.v1 (p. 1799)</a>	Amazon RDS for Oracle now supports Oracle Application Express (APEX) version 19.2.v1. For more information, see <a href="#">Oracle application Express</a> .	April 8, 2020
<a href="#">Amazon RDS for MariaDB supports a new major version (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.4. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	April 6, 2020
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for MariaDB 10.4 (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for MariaDB version 10.4. For more information, see <a href="#">Using Amazon RDS performance insights</a> .	April 6, 2020
<a href="#">Amazon RDS for PostgreSQL versions 9.3.x are deprecated (p. 1799)</a>	Amazon RDS for PostgreSQL no longer supports versions 9.3.x. For supported versions, see <a href="#">Supported PostgreSQL database versions</a> .	April 3, 2020
<a href="#">Amazon RDS for Microsoft SQL Server supports read replicas (p. 1799)</a>	You can now create read replicas for SQL Server DB instances. For more information, see <a href="#">Working with read replicas</a> .	April 3, 2020
<a href="#">Amazon RDS for Microsoft SQL Server supports multifile backups (p. 1799)</a>	You can now back up databases to multiple files using SQL Server native backup and restore. For more information, see <a href="#">Backing up a database</a> .	April 2, 2020
<a href="#">Amazon RDS for PostgreSQL supports PostgreSQL 12.2 (p. 1799)</a>	Amazon RDS for PostgreSQL supports version 12.2. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	March 31, 2020

<a href="#">Amazon RDS for Oracle integration with (p. 1799)</a>	Amazon RDS for Oracle is now integrated with AWS License Manager. If you use the Bring Your Own License model, AWS License Manager integration makes it easier to monitor your Oracle license usage within your organization. For more information, see <a href="#">Integrating with AWS License Manager</a> .	March 23, 2020
<a href="#">Support for 64 TiB on db.r5 instances in Amazon RDS for MariaDB and MySQL (p. 1799)</a>	You can now create Amazon RDS DB instances for MariaDB and MySQL that use the db.r5 DB instance class with up to 64 TiB of storage. For more information, see <a href="#">Factors that affect storage performance</a> .	March 18, 2020
<a href="#">Support for MySQL 8.0.17 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 8.0.17. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	March 10, 2020
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for MySQL 8.0 (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for MySQL version 8.0.17 and higher 8.0 versions. For more information, see <a href="#">Using Amazon RDS performance insights</a> .	March 10, 2020
<a href="#">Support for MySQL 5.6.46 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 5.6.46. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	February 28, 2020
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for MariaDB 10.3 (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for MariaDB version 10.3.13 and higher 10.3 versions. For more information, see <a href="#">Using Amazon RDS performance insights</a> .	February 26, 2020
<a href="#">Support for MySQL 5.7.28 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 5.7.28. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	February 20, 2020
<a href="#">Support for MariaDB 10.3.20 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.3.20. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	February 20, 2020

<a href="#">Amazon RDS for Oracle January 2020 RU, RUR, and PSU (p. 1799)</a>	Amazon RDS for Oracle has released database engine updates for January 2020. For more information, see <a href="#">Oracle database engine release notes</a> .	February 20, 2020
<a href="#">Amazon RDS for Microsoft SQL Server supports a new DB instance class (p. 1799)</a>	You can now create Amazon RDS DB instances running SQL Server that use the db.z1d DB instance class. For more information, see <a href="#">DB instance class support for Microsoft SQL Server</a> .	February 19, 2020
<a href="#">Support for cross-account, cross-VPC Active Directory domains in Amazon RDS for SQL Server (p. 1799)</a>	Amazon RDS for Microsoft SQL Server now supports associating DB instances with Active Directory domains owned by different accounts and VPCs. For more information, see <a href="#">Using Windows authentication with a Microsoft SQL Server DB instance</a> .	February 13, 2020
<a href="#">Oracle OLAP option (p. 1799)</a>	Amazon RDS for Oracle now supports the On-line Analytical Processing (OLAP) option for Oracle DB instances. You can use Oracle OLAP to analyze large amounts of data by creating dimensional objects and cubes in accordance with the OLAP standard. For more information, see <a href="#">Oracle OLAP</a> .	February 13, 2020
<a href="#">FIPS 140-2 support for Oracle (p. 1799)</a>	Amazon RDS for Oracle supports the Federal Information Processing Standard Publication 140-2 (FIPS 140-2) for SSL/TLS connections. For more information, see <a href="#">FIPS support</a> .	February 11, 2020
<a href="#">Amazon RDS for PostgreSQL supports new versions (p. 1799)</a>	Amazon RDS for PostgreSQL supports versions 11.6, 10.11, 9.6.16, 9.5.20, and 9.4.25. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	February 11, 2020
<a href="#">Amazon RDS for PostgreSQL supports new DB instance classes (p. 1799)</a>	You can now create Amazon RDS DB instances running PostgreSQL that use the db.m5.16xlarge, db.m5.8xlarge, db.r5.16xlarge, and db.r5.8xlarge DB instance classes. For more information, see <a href="#">Supported DB engines for all available DB instance classes</a> .	February 11, 2020

Performance Insights supports analyzing statistics of running MariaDB and MySQL queries (p. 1799)	You can now analyze statistics of running queries with Performance Insights for MariaDB and MySQL DB instances. For more information, see <a href="#">Analyzing statistics of running queries</a> .	February 4, 2020
Support for exporting DB snapshot data to Amazon S3 for MariaDB, MySQL, and PostgreSQL (p. 1799)	Amazon RDS supports exporting DB snapshot data to Amazon S3 for MariaDB, MySQL, and PostgreSQL. For more information, see <a href="#">Exporting DB snapshot data to Amazon S3</a> .	January 23, 2020
Amazon RDS for MySQL supports Kerberos authentication (p. 1799)	You can now use Kerberos authentication to authenticate users when they connect to your Amazon RDS for MySQL DB instances. For more information, see <a href="#">Using Kerberos authentication for MySQL</a> .	January 21, 2020
Amazon RDS for Oracle October 2019 RU and RUR for Oracle Database 19c (p. 1799)	Amazon RDS for Oracle has released database engine updates for October 2019 for Oracle Database 19c. For more information, see <a href="#">Oracle database engine release notes</a> .	January 9, 2020
Amazon RDS Performance Insights supports viewing more SQL text for Amazon RDS for Microsoft SQL Server (p. 1799)	Amazon RDS Performance Insights now supports viewing more SQL text in the Performance Insights dashboard for Amazon RDS for Microsoft SQL Server DB instances. For more information, see <a href="#">Viewing more SQL text in the Performance Insights dashboard</a> .	December 17, 2019
Amazon RDS proxy (p. 1799)	You can reduce the overhead of connection management on your cluster, and reduce the chance of "too many connections" errors, by using the Amazon RDS Proxy. You associate each proxy with an RDS DB instance or Aurora DB cluster. Then you use the proxy endpoint in the connection string for your application. The Amazon RDS Proxy is currently in a public preview state. It supports the RDS for MySQL database engine. For more information, see <a href="#">Managing connections with Amazon RDS proxy (preview)</a> .	December 3, 2019

<a href="#">Amazon RDS on Outposts (preview) (p. 1799)</a>	With Amazon RDS on AWS Outposts, you can create AWS-managed relational databases in your on-premises data centers. RDS on Outposts enables you to run RDS databases on AWS Outposts. For more information, see <a href="#">Amazon RDS on AWS Outposts (preview)</a> .	December 3, 2019
<a href="#">Amazon RDS for Oracle supports cross-region read replicas (p. 1799)</a>	Amazon RDS for Oracle now supports cross-region read replicas with Active Data Guard. For more information, see <a href="#">Working with read replicas</a> and <a href="#">Working with Oracle read replicas</a> .	November 26, 2019
<a href="#">Performance Insights supports analyzing statistics of running Oracle queries (p. 1799)</a>	You can now analyze statistics of running queries with Performance Insights for Oracle DB instances. For more information, see <a href="#">Analyzing statistics of running queries</a> .	November 25, 2019
<a href="#">Amazon RDS for Microsoft SQL Server supports publishing logs to CloudWatch Logs (p. 1799)</a>	You can configure your Amazon RDS for SQL Server DB instance to publish log events directly to Amazon CloudWatch Logs. For more information, see <a href="#">Publishing SQL Server logs to Amazon CloudWatch Logs</a> .	November 25, 2019
<a href="#">Amazon RDS for Microsoft SQL Server supports new DB instance classes (p. 1799)</a>	You can now create Amazon RDS DB instances running SQL Server that use the db.x1e and db.x1 DB instance classes. For more information, see <a href="#">DB instance class support for Microsoft SQL Server</a> .	November 25, 2019
<a href="#">Amazon RDS for Microsoft SQL Server supports differential and log restores (p. 1799)</a>	You can restore differential backups and logs using SQL Server native backup and restore. For more information, see <a href="#">Using native backup and restore</a> .	November 25, 2019
<a href="#">Multi-AZ supported on Amazon RDS for Microsoft SQL Server in new regions (p. 1799)</a>	Multi-AZ on SQL Server is now available in China, Middle East (Bahrain), and Europe (Stockholm). For more information, see <a href="#">Multi-AZ deployments for Microsoft SQL Server</a> .	November 22, 2019

<a href="#">Amazon RDS for Microsoft SQL Server now supports bulk insert and S3 integration (p. 1799)</a>	You can transfer files between a SQL Server DB instance and an Amazon S3 bucket. Then you can use Amazon S3 with SQL Server features such as bulk insert. For more information, see <a href="#">Integrating an Amazon RDS for SQL Server DB instance with Amazon S3</a> .	November 21, 2019
<a href="#">Amazon RDS for Oracle October 2019 RU, RUR, and PSU (p. 1799)</a>	Amazon RDS for Oracle has released database engine updates for October 2019. For more information, see <a href="#">Oracle database engine release notes</a> .	November 19, 2019
<a href="#">Performance Insights counters for Amazon RDS for Microsoft SQL Server (p. 1799)</a>	You can now add performance counters to your Performance Insights charts for Microsoft SQL Server DB instances. For more information, see <a href="#">Performance Insights counters for Amazon RDS for Microsoft SQL Server</a> .	November 12, 2019
<a href="#">Amazon RDS for Microsoft SQL Server supports new DB instance class sizes (p. 1799)</a>	You can now create Amazon RDS DB instances running SQL Server that use the 8xlarge and 16xlarge instance sizes for the db.m5 and db.r5 DB instance classes. Instance sizes ranging from small to 2xlarge are now available for the db.t3 instance class. For more information, see <a href="#">DB instance class support for Microsoft SQL Server</a> .	November 11, 2019
<a href="#">Support for PostgreSQL snapshot upgrades (p. 1799)</a>	If you have existing manual DB snapshots of your Amazon RDS PostgreSQL DB instances, you can now upgrade them to a later version of the PostgreSQL database engine. For more information, see <a href="#">Upgrading a PostgreSQL DB snapshot</a> .	November 7, 2019
<a href="#">Amazon RDS for Oracle supports a new major version (p. 1799)</a>	You can now create Amazon RDS DB instances running Oracle Database 19c (19.0). For more information, see <a href="#">Oracle Database 19c with Amazon RDS</a> .	November 7, 2019
<a href="#">Amazon RDS for PostgreSQL version 12.0 in the database preview environment (p. 1799)</a>	Amazon RDS for PostgreSQL now supports PostgreSQL Version 12.0 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL version 12.0 in the database preview environment</a> .	November 1, 2019

Amazon RDS for PostgreSQL supports Kerberos authentication (p. 1799)	You can now use Kerberos authentication to authenticate users when they connect to your Amazon RDS DB instance running PostgreSQL. For more information, see <a href="#">Using Kerberos authentication with Amazon RDS for PostgreSQL</a> .	October 28, 2019
OEM Management Agent database tasks for Oracle DB instances (p. 1799)	Amazon RDS for Oracle DB instances now support procedures to invoke certain EMCTL commands on the Management Agent. For more information, see <a href="#">OEM agent database tasks</a> .	October 24, 2019
Amazon RDS for PostgreSQL versions 11.5, 10.10, 9.6.15, 9.5.19, and 9.4.24 (p. 1799)	Amazon RDS for PostgreSQL supports versions 11.5, 10.10, 9.6.15, 9.5.19, and 9.4.24. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	October 8, 2019
Amazon RDS for PostgreSQL supports PostgreSQL transportable databases (p. 1799)	PostgreSQL Transportable Databases provide an extremely fast method of migrating an RDS PostgreSQL database between two DB instances. For more information, see <a href="#">Transporting PostgreSQL databases between DB instances</a> .	October 8, 2019
Amazon RDS for Oracle supports Kerberos authentication (p. 1799)	You can now use Kerberos authentication to authenticate users when they connect to your Amazon RDS DB instance running Oracle. For more information, see <a href="#">Using Kerberos authentication with Amazon RDS for Oracle</a> .	September 30, 2019
Amazon RDS for PostgreSQL version 12 beta 3 in the database preview environment (p. 1799)	Amazon RDS for PostgreSQL now supports PostgreSQL Version 12 Beta 3 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL version 12 beta 3 on Amazon RDS in the database preview environment</a> .	August 28, 2019
Support for MySQL 8.0.16 (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 8.0.16. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	August 19, 2019

<a href="#">Amazon RDS for Oracle supports a new major version (p. 1799)</a>	You can now create Amazon RDS DB instances running Oracle Database 18c (18.0). For more information, see <a href="#">Oracle Database 18c with Amazon RDS</a> .	August 15, 2019
<a href="#">Amazon RDS for Oracle July 2019 RU, RUR, and PSU (p. 1799)</a>	Amazon RDS for Oracle has released database engine version 12.2.0.1.ru-2019-07.rur-2019-07.r1 to support the July 2019 Release Update (RU) and Release Update Revision (RUR). Amazon RDS for Oracle has also released database engine versions 12.1.0.2.v17 and 11.2.0.4.v21 to support the July 2019 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	August 8, 2019
<a href="#">Management Agent for OEM 13c release 3 (p. 1799)</a>	Amazon RDS for Oracle DB instances now support the Management Agent for Oracle Enterprise Manager (OEM) Cloud Control 13c Release 3. For more information, see <a href="#">Oracle Management Agent for Enterprise Manager cloud control</a> .	August 7, 2019
<a href="#">Amazon RDS for PostgreSQL version 12 beta 2 in the database preview environment (p. 1799)</a>	Amazon RDS for PostgreSQL now supports PostgreSQL Version 12 Beta 2 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL version 12 beta 2 on Amazon RDS in the database preview environment</a> .	August 6, 2019
<a href="#">Amazon RDS supports server collations for SQL Server (p. 1799)</a>	Amazon RDS for SQL Server supports a selection of collations for new DB instances. For more information, see <a href="#">Collations and character sets for Microsoft SQL Server</a> .	July 29, 2019
<a href="#">Amazon RDS for PostgreSQL versions 11.4, 10.9, 9.6.14, 9.5.18, and 9.4.23 (p. 1799)</a>	Amazon RDS for PostgreSQL supports minor versions 11.4, 10.9, 9.6.14, 9.5.18, and 9.4.23. For more information, see <a href="#">Supported PostgreSQL database versions</a> .	July 3, 2019

Amazon RDS for Oracle supports Oracle APEX version 19.1.v1 (p. 1799)	Amazon RDS for Oracle now supports Oracle Application Express (APEX) version 19.1.v1. For more information, see <a href="#">Oracle application Express</a> .	June 28, 2019
Amazon RDS for PostgreSQL version 13 beta 1 in the database preview environment (p. 1799)	Amazon RDS for PostgreSQL now supports PostgreSQL Version 13 Beta 1 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL 13 versions</a> .	June 22, 2019
Amazon RDS storage autoscaling (p. 1799)	Storage autoscaling for Amazon RDS DB instances enables Amazon RDS to automatically expand the storage associated with a DB instance to reduce the chance of out-of-space conditions. For information about storage autoscaling, see <a href="#">Working with storage for Amazon RDS DB instances</a> .	June 20, 2019
Amazon RDS for Oracle supports db.z1d DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running Oracle that use the db.z1d DB instance classes. For more information, see <a href="#">DB instance class</a> .	June 13, 2019
Amazon RDS Performance Insights supports viewing more SQL text for Amazon RDS for Oracle (p. 1799)	Amazon RDS Performance Insights now supports viewing more SQL text in the Performance Insights dashboard for Amazon RDS for Oracle DB instances. For more information, see <a href="#">Viewing more SQL text in the Performance Insights dashboard</a> .	June 10, 2019
Amazon RDS adds support native restores of SQL Server databases up to 16 TB (p. 1799)	You can now do native restores of up to 16 TB from SQL Server to Amazon RDS. For more information, see <a href="#">Amazon RDS for SQL Server: Limitations and recommendations</a> .	June 4, 2019
Amazon RDS adds support for Microsoft SQL Server audit (p. 1799)	Using Amazon RDS for Microsoft SQL Server, you can audit server and database level events using SQL Server Audit, and view the results on your DB instance or send the audit log files directly to Amazon S3. For more information, see <a href="#">SQL Server Audit</a> .	May 23, 2019

<a href="#">Improvements to Amazon RDS recommendations (p. 1799)</a>	Amazon RDS has improved its automated recommendations for database resources. For example, Amazon RDS now provides recommendations for database parameters. For more information, see <a href="#">Using Amazon RDS recommendations</a> .	May 22, 2019
<a href="#">Support for more databases per DB instance for Amazon RDS for SQL Server (p. 1799)</a>	You can create up to 30 databases on each of your DB instances running Microsoft SQL Server. For more information, see <a href="#">Limits for Microsoft SQL Server DB instances</a> .	May 21, 2019
<a href="#">Support for 64 TiB and 80k IOPS of storage for Amazon RDS for MariaDB, MySQL and PostgreSQL (p. 1799)</a>	You can now create Amazon RDS DB instances for MariaDB, MySQL and PostgreSQL with up to 64 TiB of storage and up to 80,000 provisioned IOPS. For more information, see <a href="#">DB instance storage</a> .	May 20, 2019
<a href="#">Amazon RDS for MySQL supports upgrade prechecks (p. 1799)</a>	When you upgrade a DB instance from MySQL 5.7 to MySQL 8.0, Amazon RDS performs prechecks for incompatibilities. For more information, see <a href="#">Prechecks for upgrades from MySQL 5.7 to 8.0</a> .	May 17, 2019
<a href="#">Support for the MySQL password validation plugin (p. 1799)</a>	You can now use the MySQL validate_password plugin for improved security of Amazon RDS for MySQL DB instances. For more information, see <a href="#">Using the Password Validation Plugin</a> .	May 16, 2019
<a href="#">Amazon RDS for Oracle April 2019 RU, RUR, and PSU (p. 1799)</a>	Amazon RDS for Oracle has released database engine version 12.2.0.1.ru-2019-04.rur-2019-04.r1 to support the April 2019 Release Update (RU) and Release Update Revision (RUR). Amazon RDS for Oracle has also released database engine versions 12.1.0.2.v16 and 11.2.0.4.v20 to support the April 2019 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	May 16, 2019

<a href="#">Performance Insights counters for Amazon RDS for Oracle (p. 1799)</a>	You can now add performance counters to your Performance Insights charts for Oracle DB instances. For more information, see <a href="#">Performance Insights counters for Amazon RDS for Oracle</a> .	May 8, 2019
<a href="#">Amazon RDS for PostgreSQL versions 11.2, 10.7, 9.6.12, 9.5.16, and 9.4.21 (p. 1799)</a>	Amazon RDS for PostgreSQL supports minor versions 11.2, 10.7, 9.6.12, 9.5.16, and 9.4.21. For more information, see <a href="#">Supported PostgreSQL database versions</a>	May 1, 2019
<a href="#">Support for per-second billing (p. 1799)</a>	Amazon RDS is now billed in 1-second increments in all AWS Regions except AWS GovCloud (US) for on-demand instances. For more information, see <a href="#">DB instance billing for Amazon RDS</a> .	April 25, 2019
<a href="#">Support for importing data from Amazon S3 for Amazon RDS for PostgreSQL (p. 1799)</a>	You can now import data from Amazon S3 file into a table in an RDS PostgreSQL DB instance. For more information, see <a href="#">Importing Amazon S3 data into an RDS PostgreSQL DB instance</a> .	April 24, 2019
<a href="#">Support for restoring 5.7 backups from Amazon S3 (p. 1799)</a>	You can now create a backup of your MySQL version 5.7 database, store it on Amazon S3, and then restore the backup file onto a new Amazon RDS DB instance running MySQL. For more information, see <a href="#">Restoring a backup into a MySQL DB instance</a> .	April 17, 2019
<a href="#">Support for multiple major version upgrades for Amazon RDS for PostgreSQL (p. 1799)</a>	With Amazon RDS for PostgreSQL, you can now choose from multiple major versions when you upgrade the DB engine. This feature enables you to skip ahead to a newer major version when you upgrade select PostgreSQL engine versions. For more information, see <a href="#">Upgrading the PostgreSQL DB engine</a> .	April 16, 2019
<a href="#">Support for 64 TiB of storage for Amazon RDS for Oracle (p. 1799)</a>	You can now create Amazon RDS DB instances for Oracle with up to 64 TiB of storage and up to 80,000 provisioned IOPS. For more information, see <a href="#">DB instance storage</a> .	April 4, 2019

<a href="#">Support for MySQL 8.0.15 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 8.0.15. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	April 3, 2019
<a href="#">Support for MariaDB 10.3.13 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.3.13. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	April 3, 2019
<a href="#">Microsoft SQL Server 2008 R2 deprecated on Amazon RDS (p. 1799)</a>	Support for Microsoft SQL Server 2008 R2 is deprecated, coinciding with the Microsoft plan to terminate extended support for this version on July 9, 2019. Any existing Microsoft SQL Server 2008 R2 snapshots are to be automatically upgraded to the latest minor version of Microsoft SQL Server 2012 starting on June 1, 2019. For more information, see <a href="#">Microsoft SQL Server 2008 R2 support on Amazon RDS</a> .	April 2, 2019
<a href="#">Always On availability groups supported in Microsoft SQL Server 2017 (p. 1799)</a>	You can now use Always On Availability Groups in SQL Server 2017 Enterprise Edition 14.00.3049.1 or later. For more information, see <a href="#">Multi-AZ deployments for Microsoft SQL Server</a> .	March 29, 2019
<a href="#">View volume metrics (p. 1799)</a>	You can now view metrics for the Amazon Elastic Block Store (Amazon EBS) volumes, which are the physical devices used for database and log storage. For more information, see <a href="#">Viewing Enhanced Monitoring</a> .	March 20, 2019
<a href="#">Support for MySQL 5.7.25 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL version 5.7.25. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	March 19, 2019
<a href="#">Amazon RDS for Oracle supports RMAN DBA tasks (p. 1799)</a>	Amazon RDS for Oracle now supports Oracle Recovery Manager (RMAN) DBA tasks, including RMAN backups. For more information, see <a href="#">Common DBA Recovery Manager (RMAN) tasks for Oracle DB instances</a> .	March 14, 2019

<a href="#">Amazon RDS for PostgreSQL supports version 11.1 (p. 1799)</a>	You can now create Amazon RDS DB instances running PostgreSQL version 11.1. For more information, see <a href="#">PostgreSQL version 11.1 on Amazon RDS</a> .	March 12, 2019
<a href="#">Multiple-file restore is available in Amazon RDS for SQL Server (p. 1799)</a>	You can now restore from multiple files with Amazon RDS for SQL Server. For more information, see <a href="#">Restoring a database</a> .	March 11, 2019
<a href="#">MariaDB 10.2.21 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB version 10.2.21. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	March 11, 2019
<a href="#">Amazon RDS for Oracle supports read replicas (p. 1799)</a>	Amazon RDS for Oracle now supports read replicas with Active Data Guard. For more information, see <a href="#">Working with read replicas</a> and <a href="#">Working with Oracle read replicas</a> .	March 11, 2019
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for MariaDB (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for MariaDB. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	March 11, 2019
<a href="#">MySQL 8.0.13 and 5.7.24 (p. 1799)</a>	You can now create Amazon RDS DB instances running MySQL versions 8.0.13 and 5.7.24. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	March 8, 2019
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for SQL Server (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for SQL Server. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	March 4, 2019
<a href="#">Amazon RDS for Oracle supports Amazon S3 integration (p. 1799)</a>	You can now transfer files between an Amazon RDS for Oracle DB instance and an Amazon S3 bucket. For more information, see <a href="#">Integrating Amazon RDS for Oracle and Amazon S3</a> .	February 26, 2019

Amazon RDS for MySQL and Amazon RDS for MariaDB support db.t3 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running MySQL or MariaDB that use the db.t3 DB instance classes. For more information, see <a href="#">DB instance class</a> .	February 20, 2019
Amazon RDS for MySQL and Amazon RDS for MariaDB support db.r5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running MySQL or MariaDB that use the db.r5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	February 20, 2019
Performance Insights counters for RDS for MySQL and PostgreSQL (p. 1799)	You can now add performance counters to your Performance Insights charts for MySQL and PostgreSQL DB instances. For more information, see <a href="#">Performance Insights dashboard components</a> .	February 19, 2019
Amazon RDS for PostgreSQL now supports adaptive autovacuum parameter tuning (p. 1799)	Adaptive autovacuum parameter tuning with Amazon RDS for PostgreSQL helps prevent transaction ID wraparound by adjusting autovacuum parameter values automatically. For more information, see <a href="#">Reducing the likelihood of transaction ID wraparound</a> .	February 12, 2019
Amazon RDS for Oracle supports Oracle APEX versions 18.1.v1 and 18.2.v1 (p. 1799)	Amazon RDS for Oracle now supports Oracle Application Express (APEX) versions 18.1.v1 and 18.2.v1. For more information, see <a href="#">Oracle application Express</a> .	February 11, 2019
Amazon RDS for Oracle January 2019 RU, RUR, and PSU (p. 1799)	Amazon RDS for Oracle has released database engine version 12.2.0.1.ru-2019-01.rur-2019-01.r1 to support the January 2019 Release Update (RU) and Release Update Revision (RUR). Amazon RDS for Oracle has also released database engine versions 12.1.0.2.v15 and 11.2.0.4.v19 to support the January 2019 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	February 8, 2019

Amazon RDS Performance Insights supports viewing more SQL text for RDS for MySQL (p. 1799)	Amazon RDS Performance Insights now supports viewing more SQL text in the Performance Insights dashboard for MySQL DB instances. For more information, see <a href="#">Viewing more SQL text in the Performance Insights dashboard</a> .	February 6, 2019
Amazon RDS for PostgreSQL supports db.t3 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running PostgreSQL that use the db.t3 DB instance classes. For more information, see <a href="#">DB instance class</a> .	January 25, 2019
Amazon RDS for Oracle supports db.t3 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running Oracle that use the db.t3 DB instance classes. For more information, see <a href="#">DB instance class</a> .	January 25, 2019
Amazon RDS Performance Insights supports viewing more SQL text for Amazon RDS PostgreSQL (p. 1799)	Amazon RDS Performance Insights now supports viewing more SQL text in the Performance Insights dashboard for Amazon RDS PostgreSQL DB instances. For more information, see <a href="#">Viewing more SQL text in the Performance Insights dashboard</a> .	January 24, 2019
Amazon RDS for Oracle supports a new version of SQLT (p. 1799)	Amazon RDS for Oracle now supports SQLT version 12.2.180725. For more information, see <a href="#">Oracle SQLT</a> .	January 22, 2019
Amazon RDS for PostgreSQL supports new minor versions (p. 1799)	Amazon RDS for PostgreSQL now supports the following new minor versions: 10.6, 9.6.11, 9.5.15, 9.4.20, and 9.3.25. For more information, see <a href="#">Amazon RDS for PostgreSQL versions and extensions</a> .	December 19, 2018
Amazon RDS for PostgreSQL supports db.r5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running PostgreSQL that use the db.r5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	December 19, 2018

Amazon RDS for PostgreSQL now supports restricted password management (p. 1799)	Amazon RDS for PostgreSQL enables you to restrict who can manage user passwords and password expiration changes by using the parameter <code>rds.restrict_password_commands</code> and the role <code>rds_password</code> . For more information, see <a href="#">Restricting password management</a> .	December 19, 2018
Amazon RDS for PostgreSQL supports uploading database logs to Amazon CloudWatch Logs (p. 1799)	Amazon RDS for PostgreSQL supports uploading database logs to CloudWatch Logs. For more information, see <a href="#">Publishing PostgreSQL logs to CloudWatch Logs</a> .	December 10, 2018
Amazon RDS for Oracle supports db.r5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running Oracle that use the db.r5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	November 20, 2018
Retain backups when deleting a DB instance (p. 1799)	Amazon RDS supports retaining automated backups when you delete a DB instance. For more information, see <a href="#">Working with backups</a> .	November 15, 2018
Amazon RDS for PostgreSQL supports db.m5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running PostgreSQL that use the db.m5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	November 15, 2018
Amazon RDS for Oracle supports a new major version (p. 1799)	You can now create Amazon RDS DB instances running Oracle version 12.2. For more information, see <a href="#">Oracle Database 12c Release 2 (12.2.0.1) with Amazon RDS</a> .	November 13, 2018
Amazon RDS for Oracle October 2018 PSU (p. 1799)	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v14 and 11.2.0.4.v18 to support the October 2018 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	November 13, 2018
Amazon RDS for SQL Server supports Always On (p. 1799)	Amazon RDS for SQL Server supports Always On Availability Groups. For more information, see <a href="#">Multi-AZ deployments for Microsoft SQL Server</a> .	November 8, 2018

Amazon RDS for PostgreSQL supports outbound network access using custom DNS servers (p. 1799)	Amazon RDS for PostgreSQL supports outbound network access using custom DNS servers. For more information, see <a href="#">Using a custom DNS server for outbound network access</a> .	November 8, 2018
Amazon RDS for MariaDB, MySQL, and PostgreSQL supports 32 TiB of storage (p. 1799)	You can now create Amazon RDS DB instances with up to 32 TiB of storage for MySQL, MariaDB, and PostgreSQL. For more information, see <a href="#">DB instance storage</a> .	November 7, 2018
Amazon RDS for Oracle supports extended data types (p. 1799)	You can now enable extended data types on Amazon RDS DB instances running Oracle. With extended data types, the maximum size is 32,767 bytes for the VARCHAR2, NVARCHAR2, and RAW data types. For more information, see <a href="#">Using extended data types</a> .	November 6, 2018
Amazon RDS for Oracle supports db.m5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running Oracle that use the db.m5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	November 2, 2018
Amazon RDS for Oracle migration from SE, SE1, or SE2 to EE (p. 1799)	You can now migrate from any Oracle Database Standard Edition (SE, SE1, or SE2) to Oracle Database Enterprise Edition (EE). For more information, see <a href="#">Migrating between Oracle editions</a> .	October 31, 2018
Amazon RDS can now stop Multi-AZ instances (p. 1799)	Amazon RDS can now stop a DB instance that is part of a Multi-AZ deployment. Formerly, the stop instance feature had a limitation for multi-AZ instances. For more information, see <a href="#">Stopping an Amazon RDS DB instance temporarily</a> .	October 29, 2018
Amazon RDS Performance Insights is available for Amazon RDS for Oracle (p. 1799)	Amazon RDS Performance Insights is now available for Amazon RDS for Oracle. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	October 29, 2018

Amazon RDS for PostgreSQL supports PostgreSQL version 11 in the database preview environment (p. 1799)	Amazon RDS for PostgreSQL now supports PostgreSQL version 11 in the Database Preview Environment. For more information, see <a href="#">PostgreSQL version 11 on Amazon RDS in the database preview environment</a> .	October 25, 2018
MySQL supports a new major version (p. 1799)	You can now create Amazon RDS DB instances running MySQL version 8.0. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	October 23, 2018
MariaDB supports a new major version (p. 1799)	You can now create Amazon RDS DB instances running MariaDB version 10.3. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	October 23, 2018
Amazon RDS for Oracle supports Oracle JVM (p. 1799)	Amazon RDS for Oracle now supports the Oracle Java Virtual Machine (JVM) option. For more information, see <a href="#">Oracle Java virtual machine</a> .	October 16, 2018
Custom parameter group for restore and point in time recovery (p. 1799)	You can now specify a custom parameter group when you restore a snapshot or perform a point in time recovery operation. For more information, see <a href="#">Restoring from a DB snapshot</a> and <a href="#">Restoring a DB instance to a specified time</a> .	October 15, 2018
Amazon RDS for Oracle supports 32 TiB storage (p. 1799)	You can now create Oracle RDS DB instances with up to 32 TiB of storage. For more information, see <a href="#">DB instance storage</a> .	October 15, 2018
Amazon RDS for MySQL supports GTIDs (p. 1799)	Amazon RDS for MySQL now supports global transaction identifiers (GTIDs), which are unique across all DB instances and in a replication configuration. For more information, see <a href="#">Using GTID-based replication for RDS for MySQL</a> .	October 10, 2018
MySQL 5.7.23, 5.6.41, and 5.5.61 (p. 1799)	You can now create Amazon RDS DB instances running MySQL versions 5.7.23, 5.6.41, and 5.5.61. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	October 8, 2018

Amazon RDS for PostgreSQL supports new minor versions (p. 1799)	Amazon RDS for PostgreSQL now supports the following new minor versions: 10.5, 9.6.10, 9.5.14, 9.4.19, and 9.3.24. For more information, see <a href="#">Amazon RDS for PostgreSQL versions and extensions</a> .	October 4, 2018
Amazon RDS for Oracle supports a new version of SQLT (p. 1799)	Amazon RDS for Oracle now supports SQLT version 12.2.180331. For more information, see <a href="#">Oracle SQLT</a> .	October 4, 2018
Amazon RDS for Oracle July 2018 PSU (p. 1799)	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v13 and 11.2.0.4.v17 to support the July 2018 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	October 3, 2018
Amazon RDS for PostgreSQL now supports IAM authentication (p. 1799)	Amazon RDS for PostgreSQL now supports IAM authentication. For more information see <a href="#">IAM database authentication for MySQL and PostgreSQL</a> .	September 27, 2018
You can enable deletion protection for your Amazon RDS DB instances (p. 1799)	When you enable deletion protection for a DB instance, the database cannot be deleted by any user. For more information, see <a href="#">Deleting a DB instance</a> .	September 26, 2018
Amazon RDS for MySQL and Amazon RDS for MariaDB support db.m5 DB instance classes (p. 1799)	You can now create Amazon RDS DB instances running MySQL or MariaDB that use the db.m5 DB instance classes. For more information, see <a href="#">DB instance class</a> .	September 18, 2018
Amazon RDS now supports upgrades to SQL Server 2017 (p. 1799)	You can upgrade your existing DB instance to SQL Server 2017 from any version except SQL Server 2008. To upgrade from SQL Server 2008, first upgrade to one of the other versions first. For information, see <a href="#">Upgrading the Microsoft SQL Server DB engine</a> .	September 11, 2018

Amazon RDS for PostgreSQL now supports PostgreSQL version 11 beta 3 in the database preview environment (p. 1799)	In this release, the Write-Ahead Log (WAL) segment size ( <code>wal_segment_size</code> ) is now set to 64MB. For more about PostgreSQL version 11 Beta 3, see <a href="#">PostgreSQL 11 beta 3 released</a> . For information on the Database Preview Environment, see <a href="#">Working with the database preview environment</a> .	September 7, 2018
Amazon Aurora User Guide (p. 1799)	The <a href="#">Amazon Aurora User Guide</a> describes all Amazon Aurora concepts and provides instructions on using the various features with both the console and the command line interface. The <a href="#">Amazon RDS User Guide</a> now covers non-Aurora database engines.	August 31, 2018
Amazon RDS Performance Insights is available for RDS for MySQL (p. 1799)	Amazon RDS Performance Insights is now available for RDS for MySQL. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	August 28, 2018
Amazon Aurora PostgreSQL-Compatible Edition now supports Aurora Auto Scaling (p. 1799)	Auto Scaling of Aurora replicas is now available for Amazon Aurora PostgreSQL-Compatible Edition. For more information, see <a href="#">Using Amazon Aurora auto scaling with Aurora replicas</a> .	August 16, 2018
Aurora Serverless for Aurora MySQL (p. 1799)	Aurora Serverless is an on-demand, autoscaling configuration for Amazon Aurora. For more information, see <a href="#">Using Amazon Aurora Serverless</a> .	August 9, 2018
MySQL 5.7.22 and 5.6.40 (p. 1799)	You can now create Amazon RDS DB instances running MySQL versions 5.7.22 and 5.6.40. For more information, see <a href="#">MySQL on Amazon RDS versions</a> .	August 6, 2018
Aurora is now available in the China (Ningxia) region (p. 1799)	Aurora MySQL and Aurora PostgreSQL are now available in the China (Ningxia) region. For more information, see <a href="#">Availability for Amazon Aurora MySQL</a> and <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	August 6, 2018

<a href="#">Amazon RDS for MySQL supports delayed replication (p. 1799)</a>	Amazon RDS for MySQL now supports delayed replication as a strategy for disaster recovery. For more information, see <a href="#">Configuring delayed replication with MySQL</a> .	August 6, 2018
<a href="#">Amazon RDS Performance Insights is available for Aurora MySQL (p. 1799)</a>	Amazon RDS Performance Insights is now available for Aurora MySQL. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	August 6, 2018
<a href="#">Amazon RDS Performance Insights integration with Amazon CloudWatch (p. 1799)</a>	Amazon RDS Performance Insights automatically publishes metrics to Amazon CloudWatch. For more information, see <a href="#">Performance Insights metrics published to CloudWatch</a> .	August 6, 2018
<a href="#">Amazon RDS recommendations (p. 1799)</a>	Amazon RDS now provides automated recommendations for database resources. For more information, see <a href="#">Using Amazon RDS recommendations</a> .	July 25, 2018
<a href="#">Amazon RDS for PostgreSQL supports new minor versions (p. 1799)</a>	Amazon RDS for PostgreSQL now supports the following new minor versions: 10.4, 9.6.9, 9.5.13, 9.4.18, and 9.3.23. For more information, see <a href="#">Amazon RDS for PostgreSQL versions and extensions</a> .	July 25, 2018
<a href="#">Incremental snapshot copies across Regions (p. 1799)</a>	Amazon RDS supports incremental snapshot copies across AWS Regions for both unencrypted and encrypted instances. For more information, see <a href="#">Copying snapshots across AWS Regions</a> .	July 24, 2018
<a href="#">Amazon RDS Performance Insights is available for Amazon RDS for PostgreSQL (p. 1799)</a>	Amazon RDS Performance Insights is now available for Amazon RDS for PostgreSQL. For more information, see <a href="#">Using Amazon RDS Performance Insights</a> .	July 18, 2018
<a href="#">Amazon RDS for Oracle supports Oracle APEX version 5.1.4.v1 (p. 1799)</a>	Amazon RDS for Oracle now supports Oracle Application Express (APEX) version 5.1.4.v1. For more information, see <a href="#">Oracle application Express</a> .	July 10, 2018

<a href="#">Amazon RDS for Oracle supports publishing logs to Amazon CloudWatch Logs (p. 1799)</a>	Amazon RDS for Oracle now supports publishing alert, audit, trace, and listener log data to a log group in CloudWatch Logs. For more information, see <a href="#">Publishing Oracle logs to Amazon CloudWatch Logs</a> .	July 9, 2018
<a href="#">MariaDB 10.2.15, 10.1.34, and 10.0.35 (p. 1799)</a>	You can now create Amazon RDS DB instances running MariaDB versions 10.2.15, 10.1.34, and 10.0.35. For more information, see <a href="#">MariaDB on Amazon RDS versions</a> .	July 5, 2018
<a href="#">Aurora PostgreSQL 1.2 is available and compatible with PostgreSQL 9.6.8 (p. 1799)</a>	Aurora PostgreSQL 1.2 is now available and is compatible with PostgreSQL 9.6.8. For more information, see <a href="#">Version 1.2</a> .	June 27, 2018
<a href="#">Read replicas for Amazon RDS PostgreSQL support Multi-AZ deployments (p. 1799)</a>	RDS read replicas in Amazon RDS PostgreSQL now support multiple Availability Zones. For more information, see <a href="#">Working with PostgreSQL read replicas</a> .	June 25, 2018
<a href="#">Performance Insights available for Aurora PostgreSQL (p. 1799)</a>	Performance Insights is generally available for Aurora PostgreSQL, with support for extended retention of performance data. For more information, see <a href="#">Using Amazon RDS performance insights</a> .	June 21, 2018
<a href="#">Aurora PostgreSQL available in western US (northern california) region (p. 1799)</a>	Aurora PostgreSQL is now available in the western United States (Northern California) region. For more information, see <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	June 11, 2018
<a href="#">Amazon RDS for Oracle now supports CPU configuration (p. 1799)</a>	Amazon RDS for Oracle supports configuring the number of CPU cores and the number of threads for each core for the processor of a DB instance class. For more information, see <a href="#">Configuring the processor of the DB instance class</a> .	June 5, 2018
<a href="#">Amazon RDS for Oracle April 2018 PSU (p. 1799)</a>	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v12 and 11.2.0.4.v16 to support the April 2018 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes</a> .	June 1, 2018

## Earlier updates

The following table describes the important changes in each release of the *Amazon RDS User Guide* before June 2018.

Change	Description	Date changed
Amazon RDS for PostgreSQL now supports PostgreSQL Version 11 Beta 1 in the Database Preview Environment	<p>PostgreSQL version 11 Beta 1 contains several improvements that are described in <a href="#">PostgreSQL 11 beta 1 released!</a></p> <p>For information on the Database Preview Environment, see <a href="#">Working with the database preview environment (p. 1495)</a>.</p>	May 31, 2018
Amazon RDS for Oracle now supports TLS versions 1.0 and 1.2	Amazon RDS for Oracle supports Transport Layer Security (TLS) versions 1.0 and 1.2. For more information, see <a href="#">TLS versions for the Oracle SSL option (p. 1194)</a> .	May 30, 2018
Aurora MySQL supports publishing logs to Amazon CloudWatch Logs	Aurora MySQL now supports publishing general, slow, audit, and error log data to a log group in CloudWatch Logs. For more information, see <a href="#">Publishing Aurora MySQL to CloudWatch Logs</a> .	May 23, 2018
Database Preview Environment for Amazon RDS PostgreSQL	You can now launch a new instance of Amazon RDS PostgreSQL in a preview mode. For more information about the Database Preview Environment see, <a href="#">Working with the database preview environment (p. 1495)</a> .	May 22, 2018
Amazon RDS for Oracle DB instances support new DB instance classes	Oracle DB instances now support the db.x1e and db.x1 DB instance classes. For more information, see <a href="#">DB instance classes (p. 7)</a> and <a href="#">RDS for Oracle instance classes (p. 1002)</a> .	May 22, 2018
Amazon RDS PostgreSQL now supports <code>postgres_fdw</code> on a read replica.	You can now use <code>postgres_fdw</code> to connect to a remote server from a read replica. For more information see, <a href="#">Accessing external data with the postgres_fdw extension (p. 1630)</a> .	May 17, 2018
Amazon RDS for Oracle now supports setting <code>sqlnet.ora</code> parameters	You can now set <code>sqlnet.ora</code> parameters with Amazon RDS for Oracle. For more information, see <a href="#">Modifying connection properties using sqlnet.ora parameters (p. 1019)</a> .	May 10, 2018
Aurora PostgreSQL available in Asia Pacific (Seoul) region.	Aurora PostgreSQL is now available in the Asia Pacific (Seoul) region. For more information, see <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	May 9, 2018
Aurora MySQL supports backtracking	Aurora MySQL now supports "rewinding" a DB cluster to a specific time, without restoring data from a backup. For more information, see <a href="#">Backtracking an Aurora DB cluster</a> .	May 9, 2018
Aurora MySQL supports encrypted	Aurora MySQL now supports encrypted migration and replication from an external MySQL database. For more	April 25, 2018

Change	Description	Date changed
migration and replication from external MySQL	information, see <a href="#">Migrating data from an external MySQL database to an Amazon Aurora MySQL DB cluster</a> and <a href="#">Replication between Aurora and MySQL or between Aurora and another Aurora DB cluster</a> .	
Amazon Aurora PostgreSQL-Compatible Edition support for the Copy-on-Write protocol.	You can now clone databases in an Aurora PostgreSQL database cluster. For more information see, <a href="#">Cloning databases in an Aurora DB cluster</a> .	April 10, 2018
MariaDB 10.2.12, 10.1.31, and 10.0.34	You can now create Amazon RDS DB instances running MariaDB versions 10.2.12, 10.1.31, and 10.0.34. For more information, see <a href="#">MariaDB on Amazon RDS versions (p. 583)</a> .	March 21, 2018
Aurora PostgreSQL Support for new regions	Aurora PostgreSQL is now available in the EU (London) and Asia Pacific (Singapore) regions. For more information, see <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	March 13, 2018
MySQL 5.7.21, 5.6.39, and 5.5.59	You can now create Amazon RDS DB instances running MySQL versions 5.7.21, 5.6.39, and 5.5.59. For more information, see <a href="#">MySQL on Amazon RDS versions (p. 836)</a> .	March 9, 2018
Amazon RDS for Oracle now supports Oracle REST Data Services	Amazon RDS for Oracle supports Oracle REST Data Services as part of the APEX option. For more information, see <a href="#">Oracle Application Express (APEX) (p. 1152)</a> .	March 9, 2018
Amazon Aurora MySQL-Compatible Edition available in new AWS Region	Aurora MySQL is now available in the Asia Pacific (Singapore) region. For the complete list of AWS Regions for Aurora MySQL, see <a href="#">Availability for Amazon Aurora MySQL</a> .	March 6, 2018
Support for PostgreSQL 10.1	Amazon RDS now supports version 10.1 of PostgreSQL. For more information, see <a href="#">PostgreSQL version 10.1 on Amazon RDS (p. 1508)</a>	February 27, 2018
Oracle January 2018 PSU	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v11 and 11.2.0.4.v15 to support the January 2018 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	February 22, 2018
Amazon RDS DB instances running Microsoft SQL Server support change data capture (CDC)	DB instances running Amazon RDS for Microsoft SQL Server now support change data capture (CDC). For more information, see <a href="#">Change data capture support for Microsoft SQL Server DB instances (p. 649)</a> .	February 6, 2018
Aurora MySQL supports a new major version	You can now create Aurora MySQL DB clusters running MySQL version 5.7. For more information, see <a href="#">Amazon Aurora MySQL database engine updates 2018-02-06</a> .	February 6, 2018

Change	Description	Date changed
Support for PostgreSQL 9.6.6	Amazon RDS PostgreSQL now supports version 9.6.6. This release also includes support for the prefix and orafce extensions. For more information, see <a href="#">PostgreSQL version 9.6.6 on Amazon RDS (p. 1512)</a> .	January 19, 2018
Publish MySQL and MariaDB logs to Amazon CloudWatch Logs	You can now publish MySQL and MariaDB log data to CloudWatch Logs. For more information, see <a href="#">Publishing MySQL logs to Amazon CloudWatch Logs (p. 544)</a> and <a href="#">Publishing MariaDB logs to Amazon CloudWatch Logs (p. 531)</a> .	January 17, 2018
Multi-AZ support for read replicas	You can now create a read replica as a Multi-AZ DB instance. Amazon RDS creates a standby of your replica in another Availability Zone for failover support for the replica. Creating your read replica as a Multi-AZ DB instance is independent of whether the source database is a Multi-AZ DB instance. For more information, see <a href="#">Working with read replicas (p. 279)</a> .	January 11, 2018
Amazon RDS for MariaDB supports a new major version	You can now create Amazon RDS DB instances running MariaDB version 10.2. For more information, see <a href="#">MariaDB 10.2 support on Amazon RDS (p. 586)</a> .	January 3, 2018
Amazon Aurora PostgreSQL-Compatible Edition available in new AWS Region	Aurora PostgreSQL is now available in the EU (Paris) region. For the complete list of AWS Regions for Aurora PostgreSQL, see <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	December 22, 2017
Aurora PostgreSQL supports new instance types	Aurora PostgreSQL now supports new instance types. For the complete list of instance types, see <a href="#">Choosing the DB instance class</a> .	December 20, 2017
Oracle October 2017 PSU	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v10 and 11.2.0.4.v14 to support the October 2017 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	December 19, 2017
Amazon Aurora MySQL-Compatible Edition available in new AWS Region	Aurora MySQL is now available in the EU (Paris) region. For the complete list of AWS Regions for Aurora MySQL, see <a href="#">Availability for Amazon Aurora MySQL</a> .	December 18, 2017
Aurora MySQL supports hash joins	This feature can improve query performance when you need to join a large amount of data by using an equijoin. For more information, see <a href="#">Working with hash joins in Aurora MySQL</a> .	December 11, 2017
Aurora MySQL supports native functions to invoke AWS Lambda functions	You can call the native functions <code>lambda_sync</code> and <code>lambda_async</code> when you use Aurora MySQL. For more information, see <a href="#">Invoking a Lambda function from an Amazon Aurora MySQL DB cluster</a> .	December 11, 2017

Change	Description	Date changed
Added Aurora PostgreSQL HIPAA eligibility	Aurora PostgreSQL now supports building HIPAA compliant applications. For more information, see <a href="#">Working with Amazon Aurora PostgreSQL</a> .	December 6, 2017
Additional AWS Regions available for Amazon Aurora with PostgreSQL compatibility	Amazon Aurora with PostgreSQL compatibility is now available in four new AWS Regions. For more information, see <a href="#">Availability for Amazon Aurora PostgreSQL</a> .	November 22, 2017
Modify storage for Amazon RDS DB instances running Microsoft SQL Server	You can now modify the storage of your Amazon RDS DB instances running SQL Server. For more information, see <a href="#">Modifying an Amazon RDS DB instance (p. 251)</a> .	November 21, 2017
Amazon RDS supports 16 TiB storage for Linux-based engines	You can now create MySQL, MariaDB, PostgreSQL, and Oracle RDS DB instances with up to 16 TiB of storage. For more information, see <a href="#">Amazon RDS DB instance storage (p. 40)</a> .	November 21, 2017
Amazon RDS supports fast scale up of storage	You can now add storage to MySQL, MariaDB, PostgreSQL, and Oracle RDS DB instances in a few minutes. For more information, see <a href="#">Amazon RDS DB instance storage (p. 40)</a> .	November 21, 2017
Amazon RDS supports MariaDB versions 10.1.26 and 10.0.32	You can now create Amazon RDS DB instances running MariaDB versions 10.1.26 and 10.0.32. For more information, see <a href="#">MariaDB on Amazon RDS versions (p. 583)</a> .	November 20, 2017
Amazon RDS for Microsoft SQL Server now supports new DB instance classes	You can now create Amazon RDS DB instances running SQL Server that use the db.r4 and db.m4.16xlarge DB instance classes. For more information, see <a href="#">DB instance class support for Microsoft SQL Server (p. 641)</a> .	November 20, 2017
Amazon RDS for MySQL and MariaDB now supports new DB instance classes	You can now create Amazon RDS DB instances running MySQL and MariaDB that use the db.r4, db.m4.16xlarge, db.t2.xlarge, and db.t2.2xlarge DB instance classes. For more information, see <a href="#">DB instance classes (p. 7)</a> .	November 20, 2017
SQL Server 2017	You can now create Amazon RDS DB instances running Microsoft SQL Server 2017. You can also create DB instances running SQL Server 2016 SP1 CU5. For more information, see <a href="#">Microsoft SQL Server on Amazon RDS (p. 637)</a> .	November 17, 2017
Restore MySQL backups from Amazon S3	You can now create a backup of your on-premises database, store it on Amazon S3, and then restore the backup file onto a new Amazon RDS DB instance running MySQL. For more information, see <a href="#">Restoring a backup into a MySQL DB instance (p. 880)</a> .	November 17, 2017

Change	Description	Date changed
Auto Scaling with Aurora Replicas	Amazon Aurora MySQL now supports Aurora Auto Scaling. Aurora Auto Scaling dynamically adjusts the number of Aurora Replicas based on increases or decreases in connectivity or workload. For more information, see <a href="#">Using Amazon Aurora Auto Scaling with Aurora replicas</a> .	November 17, 2017
Oracle default edition support	Amazon RDS for Oracle DB instances now supports setting the default edition for the DB instance. For more information, see <a href="#">Setting the default edition for a DB instance (p. 1069)</a> .	November 3, 2017
Oracle DB instance file validation	Amazon RDS for Oracle DB instances now supports validating DB instance files with the Oracle Recovery Manager (RMAN) logical validation utility. For more information, see <a href="#">Validating DB instance files (p. 1085)</a> .	November 3, 2017
Oracle July 2017 PSU	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v9 and 11.2.0.4.v13 to support the July 2017 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	November 3, 2017
Management Agent for OEM 13c	Amazon RDS for Oracle DB instances now support the Management Agent for Oracle Enterprise Manager (OEM) Cloud Control 13c. For more information, see <a href="#">Oracle Management Agent for Enterprise Manager Cloud Control (p. 1166)</a> .	November 1, 2017
PostgreSQL 9.6.5, 9.5.9, 9.4.14, and 9.3.19	You can now create Amazon RDS DB instances running PostgreSQL versions 9.6.5., 9.5.9, 9.4.14, and 9.3.19. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> .	November 1, 2017
Storage reconfiguration for Microsoft SQL Server snapshots	You can now reconfigure the storage when you restore a snapshot to an Amazon RDS DB instance running Microsoft SQL Server. For more information, see <a href="#">Restoring from a DB snapshot (p. 352)</a> .	October 26, 2017
Asynchronous key prefetch for Aurora MySQL-Compatible Edition	Asynchronous key prefetch (AKP) improves the performance of noncached index joins, by prefetching keys in memory ahead of when they are needed. For more information, see <a href="#">Working with asynchronous key prefetch in Amazon Aurora</a> .	October 26, 2017
MySQL 5.7.19, 5.6.37, and 5.5.57	You can now create Amazon RDS DB instances running MySQL versions 5.7.19, 5.6.37, and 5.5.57. For more information, see <a href="#">MySQL on Amazon RDS versions (p. 836)</a> .	October 25, 2017
General availability of Amazon Aurora with PostgreSQL compatibility	Amazon Aurora with PostgreSQL compatibility makes it simple and cost-effective to set up, operate, and scale your new and existing PostgreSQL deployments, thus freeing you to focus on your business and applications. For more information, see <a href="#">Working with Amazon Aurora PostgreSQL</a> .	October 24, 2017

Change	Description	Date changed
Amazon RDS for Oracle DB instances support new DB instance classes	Amazon RDS for Oracle DB instances now support Memory Optimized Next Generation (db.r4) instance classes. Amazon RDS for Oracle DB instances also now support the following new current generation instance classes: db.m4.16xlarge, db.t2.xlarge, and db.t2.2xlarge. For more information, see <a href="#">DB instance classes (p. 7)</a> and <a href="#">RDS for Oracle instance classes (p. 1002)</a> .	October 23, 2017
New feature	Your new and existing Reserved Instances can now cover multiple sizes in the same DB instance class. Size-flexible reserved instances are available for DB instances with the same AWS Region, database engine, and instance family, and across AZ configuration. Size-flexible reserved instances are available for the following database engines: Amazon Aurora, MariaDB, MySQL, Oracle (Bring Your Own License), PostgreSQL. For more information, see <a href="#">Size-flexible reserved DB instances (p. 58)</a> .	October 11, 2017
New feature	You can now use the Oracle SQLT option to tune a SQL statement for optimal performance. For more information, see <a href="#">Oracle SQLT (p. 1205)</a> .	September 22, 2017
New feature	If you have existing manual DB snapshots of your Amazon RDS for Oracle DB instances, you can now upgrade them to a later version of the Oracle database engine. For more information, see <a href="#">Upgrading an Oracle DB snapshot (p. 1229)</a> .	September 20, 2017
New feature	You can now use Oracle Spatial to store, retrieve, update, and query spatial data in your Amazon RDS DB instances running Oracle. For more information, see <a href="#">Oracle Spatial (p. 1202)</a> .	September 15, 2017
New feature	You can now use Oracle Locator to support internet and wireless service-based applications and partner-based GIS solutions with your Amazon RDS DB instances running Oracle. For more information, see <a href="#">Oracle Locator (p. 1182)</a> .	September 15, 2017
New feature	You can now use Oracle Multimedia to store, manage, and retrieve images, audio, video, and other heterogeneous media data in your Amazon RDS DB instances running Oracle. For more information, see <a href="#">Oracle Multimedia (p. 1185)</a> .	September 15, 2017
New feature	You can now export audit logs from your Amazon Aurora MySQL DB clusters to Amazon CloudWatch Logs. For more information, see <a href="#">Publishing Aurora MySQL logs to Amazon CloudWatch Logs</a> .	September 14, 2017
New feature	Amazon RDS now supports multiple versions of Oracle Application Express (APEX) for your DB instances running Oracle. For more information, see <a href="#">Oracle Application Express (APEX) (p. 1152)</a> .	September 13, 2017

Change	Description	Date changed
New feature	You can now use Amazon Aurora to migrate an unencrypted or encrypted DB snapshot or MySQL DB instance to an encrypted Aurora MySQL DB cluster. For more information, see <a href="#">Migrating an RDS for MySQL snapshot to Aurora</a> and <a href="#">Migrating data from a MySQL DB instance to an Amazon Aurora MySQL DB cluster by using an Aurora read replica</a> .	September 5, 2017
New feature	You can use Amazon RDS for Microsoft SQL Server databases to build HIPAA-compliant applications. For more information, see <a href="#">Compliance program support for Microsoft SQL Server DB instances (p. 643)</a> .	August 31, 2017
New feature	You can now use Amazon RDS for MariaDB databases to build HIPAA-compliant applications. For more information, see <a href="#">MariaDB on Amazon RDS (p. 581)</a> .	August 31, 2017
New feature	You can now create Amazon RDS DB instances running Microsoft SQL Server with allocated storage up to 16 TiB, and Provisioned IOPS to storage ranges of 1:1–50:1. For more information, see <a href="#">Amazon RDS DB instance storage (p. 40)</a> .	August 22, 2017
New feature	You can now use Multi-AZ deployments for DB instances running Microsoft SQL Server in the EU (Frankfurt) region. For more information, see <a href="#">Multi-AZ deployments for Amazon RDS for Microsoft SQL Server (p. 705)</a> .	August 3, 2017
New feature	You can now create Amazon RDS DB instances running MariaDB versions 10.1.23 and 10.0.31. For more information, see <a href="#">MariaDB on Amazon RDS versions (p. 583)</a> .	July 17, 2017
New feature	Amazon RDS now supports Microsoft SQL Server Enterprise Edition with the License Included model in all AWS Regions. For more information, see <a href="#">Licensing Microsoft SQL Server on Amazon RDS (p. 662)</a> .	July 13, 2017
New feature	Amazon RDS for Oracle now supports Linux kernel huge pages for increased database scalability. The use of huge pages results in smaller page tables and less CPU time spent on memory management, increasing the performance of large database instances. You can use huge pages with your Amazon RDS DB instances running all editions of Oracle versions 12.1.0.2 and 11.2.0.4. For more information, see <a href="#">Enabling HugePages for an Oracle DB instance (p. 1114)</a> .	July 7, 2017
New feature	Updated to support encryption at rest (EAR) for db.t2.small and db.t2.medium DB instance classes for all non-Aurora DB engines. For more information, see <a href="#">Availability of Amazon RDS encryption (p. 1670)</a> .	June 27, 2017
New feature	Updated to support Amazon Aurora in the Europe (Frankfurt) region. For more information, see <a href="#">Availability for Amazon Aurora MySQL</a> .	June 16, 2017

Change	Description	Date changed
New feature	You can now specify an option group when you copy a DB snapshot across AWS regions. For more information, see <a href="#">Option group considerations (p. 359)</a> .	June 12, 2017
New feature	You can now copy DB snapshots created from specialized DB instances across AWS regions. You can copy snapshots from DB instances that use Oracle TDE, Microsoft SQL Server TDE, and Microsoft SQL Server Multi-AZ with Mirroring. For more information, see <a href="#">Copying a DB snapshot (p. 360)</a> .	June 12, 2017
New feature	Amazon Aurora now allows you to quickly and cost-effectively copy all of your databases in an Amazon Aurora DB cluster. For more information, see <a href="#">Cloning databases in an Aurora DB cluster</a> .	June 12, 2017
New feature	Amazon RDS now supports Microsoft SQL Server 2016 SP1 CU2. For more information, see <a href="#">Microsoft SQL Server on Amazon RDS (p. 637)</a> .	June 7, 2017
New feature	Amazon RDS for Oracle has released database engine versions 12.1.0.2.v8 and 11.2.0.4.v12 to support the April 2017 Oracle Database Patch Set Update (PSU). For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	May 23, 2017
New Feature	Amazon RDS now supports PostgreSQL versions 9.6.2, 9.5.6, 9.4.11, and 9.3.16. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a>	May 3, 2017
Preview	Public preview of Amazon Aurora with PostgreSQL Compatibility. For more information, see <a href="#">Working with Amazon Aurora PostgreSQL</a> .	April 19, 2017
New feature	Amazon Aurora now allows you to run an <code>ALTER TABLE <i>tbl_name</i> ADD COLUMN <i>col_name</i> <i>column_definition</i></code> operation nearly instantaneously. The operation completes without requiring the table to be copied and without materially impacting other DML statements. For more information, see <a href="#">Altering tables in Amazon Aurora using fast DDL</a> .	April 5, 2017
New feature	We have added a new monitoring command, <code>SHOW VOLUME STATUS</code> , to display the number of nodes and disks in a volume. For more information, see <a href="#">Displaying volume status for an Aurora DB cluster</a> .	April 5, 2017
New feature	Amazon RDS for Oracle now includes the January 2017 Oracle Database Patch Set Update (PSU). This adds support for database engine versions 12.1.0.2.v7 and 11.2.0.4.v11. For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	March 21, 2017
New feature	You can now use your own custom logic in your custom password verification functions for Oracle on Amazon RDS. For more information, see <a href="#">Creating custom functions to verify passwords (p. 1054)</a> .	March 21, 2017

Change	Description	Date changed
New feature	You can now access your online and archived redo log files on your Oracle DB instances on Amazon RDS. For more information, see <a href="#">Accessing transaction logs (p. 1080)</a> .	March 21, 2017
New feature	You can now copy both encrypted and unencrypted DB cluster snapshots between accounts in the same region. For more information, see <a href="#">Copying a DB cluster snapshot across accounts</a> .	March 7, 2017
New feature	You can now share encrypted DB cluster snapshots between accounts in the same region. For more information, see <a href="#">Sharing a DB cluster snapshot</a> .	March 7, 2017
New feature	You can now replicate encrypted Amazon Aurora MySQL DB clusters to create cross-region Aurora Replicas. For more information, see <a href="#">Replicating Aurora MySQL DB clusters across AWS Regions</a> .	March 7, 2017
New feature	You can now require that all connections to your DB instance running Microsoft SQL Server use Secure Sockets Layer (SSL). For more information, see <a href="#">Using SSL with a Microsoft SQL Server DB instance (p. 711)</a> .	February 27, 2017
New feature	You can now set your local time zone to one of 15 additional time zones. For more information, see <a href="#">Supported time zones (p. 654)</a> .	February 27, 2017
New feature	You can now use the Amazon RDS procedure <code>msdb.dbo.rds_shrink_tempdbfile</code> to shrink the tempdb database on your DB instances running Microsoft SQL Server. For more information, see <a href="#">Shrinking the tempdb database (p. 818)</a> .	February 17, 2017
New feature	You can now compress your backup file when you export your Enterprise and Standard Edition Microsoft SQL Server database from an Amazon RDS DB instance to Amazon S3. For more information, see <a href="#">Compressing backup files (p. 692)</a> .	February 17, 2017
New feature	Amazon RDS now supports custom DNS servers to resolve DNS names used in outbound network access on your DB instances running Oracle. For more information, see <a href="#">Setting up a custom DNS server (p. 1057)</a> .	January 26, 2017
New feature	Amazon RDS now supports creating an encrypted read replica in another region. For more information, see <a href="#">Creating a read replica in a different AWS Region (p. 292)</a> and <a href="#">CreateDBInstanceReadReplica</a> .	January 23, 2017
New feature	Amazon RDS now supports upgrading a MySQL DB snapshot from MySQL 5.1 to MySQL 5.5. For more information, see <a href="#">Upgrading a MySQL DB snapshot (p. 872)</a> and <a href="#">ModifyDBSnapshot</a> .	January 20, 2017

Change	Description	Date changed
New feature	Amazon RDS now supports copying an encrypted DB snapshot to another region for the MariaDB, MySQL, Oracle, PostgreSQL, and Microsoft SQL Server database engines. For more information, see <a href="#">Copying a DB snapshot (p. 360)</a> and <a href="#">CopyDBSnapshot</a> .	December 20, 2016
New feature	Amazon RDS now supports migrating an RDS for MySQL 5.6 DB snapshot to a new DB instance running MariaDB 10.1. For more information, see <a href="#">Migrating data from a MySQL DB snapshot to a MariaDB DB instance (p. 610)</a> .	December 20, 2016
New feature	Amazon Aurora MySQL now supports spatial indexing. Spatial indexing improves query performance on large datasets for queries that use spatial data. For more information, see <a href="#">Amazon Aurora MySQL and spatial data</a> .	December 14, 2016
New feature	Amazon RDS for Oracle now includes the October 2016 Oracle Database Patch Set Update (PSU). This adds support for Oracle database engine versions 12.1.0.2.v6 and 11.2.0.4.v10. For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	December 12, 2016
New feature	Amazon RDS now supports outbound network access on your DB instances running Oracle. You can use <code>utl_http</code> , <code>utl_tcp</code> , and <code>utl_smtp</code> to connect from your DB instance to the network. For more information, see <a href="#">Configuring outbound network access on your Oracle DB instance (p. 1037)</a> .	December 5, 2016
New feature	Amazon RDS has retired support for MySQL version 5.1. However, you can restore existing MySQL 5.1 snapshots to a MySQL 5.5 instance. For more information, see <a href="#">Supported storage engines for RDS for MySQL (p. 840)</a> .	November 15, 2016
New feature	Amazon RDS now supports PostgreSQL version 9.6.1. For more information, see <a href="#">PostgreSQL version 9.6.1 on Amazon RDS (p. 1513)</a> .	November 11, 2016
New feature	Amazon RDS now supports Microsoft SQL Server 2016 RTM CU2. For more information, see <a href="#">Microsoft SQL Server on Amazon RDS (p. 637)</a> .	November 4, 2016
New feature	Amazon RDS now supports major version upgrades for DB instances running Oracle. You can now upgrade your Oracle DB instances from 11g to 12c. For more information, see <a href="#">Upgrading the Oracle DB engine (p. 1221)</a> .	November 2, 2016
New feature	You can now create DB instances running Microsoft SQL Server 2014 Enterprise Edition. Amazon RDS now supports SQL Server 2014 SP2 for all editions and all regions. For more information, see <a href="#">Microsoft SQL Server on Amazon RDS (p. 637)</a> .	October 25, 2016

Change	Description	Date changed
New feature	Amazon Aurora MySQL now integrates with other AWS services: You can load text or XML data into a table from an Amazon S3 bucket, or invoke an AWS Lambda function from database code. For more information, see <a href="#">Integrating Aurora MySQL with other AWS services</a> .	October 18, 2016
New feature	You can now access the tempdb database on your Amazon RDS DB instances running Microsoft SQL Server. You can access the tempdb database by using Transact-SQL through Microsoft SQL Server Management Studio (SSMS), or any other standard SQL client application. For more information, see <a href="#">Accessing the tempdb database on Microsoft SQL Server DB instances on Amazon RDS (p. 818)</a> .	September 29, 2016
New feature	You can now use the UTL_MAIL package with your Amazon RDS DB instances running Oracle. For more information, see <a href="#">Oracle UTL_MAIL (p. 1218)</a> .	September 20, 2016
New feature	Amazon RDS for Oracle now includes the July 2016 Oracle Database Patch Set Update (PSU). This adds support for Oracle database engine versions 12.1.0.2.v5, 12.1.0.1.v6, and 11.2.0.4.v9. For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	September 20, 2016
New features	You can now set the time zone of your new Microsoft SQL Server DB instances to a local time zone, to match the time zone of your applications. For more information, see <a href="#">Local time zone for Microsoft SQL Server DB instances (p. 653)</a> .	September 19, 2016
New features	Added support for new PostgreSQL versions 9.5.4, 9.4.9, and 9.3.14. Also added support for PostgreSQL logical replication, PostgreSQL event triggers, and RAM disk for the PostgreSQL stats_temp_directory. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> , <a href="#">Logical replication for PostgreSQL on Amazon RDS (p. 1540)</a> , <a href="#">Event triggers for PostgreSQL on Amazon RDS (p. 1542)</a> , and <a href="#">RAM disk for the stats_temp_directory (p. 1544)</a> .	September 14, 2016
New feature	You can now use the Oracle Label Security option to control access to individual table rows in your Amazon RDS DB instances running Oracle Database 12c. With Oracle Label Security, you can enforce regulatory compliance with a policy-based administration model, and ensure that an access to sensitive data is restricted to only users with the appropriate clearance level. For more information, see <a href="#">Oracle Label Security (p. 1179)</a> .	September 8, 2016

Change	Description	Date changed
New feature	You can now connect to an Amazon Aurora DB cluster using the reader endpoint, which load-balances connections across the Aurora Replicas that are available in the DB cluster. As clients request new connections to the reader endpoint, Aurora distributes the connection requests among the Aurora Replicas in the DB cluster. This functionality can help balance your read workload across multiple Aurora Replicas in your DB cluster. For more information, see <a href="#">Amazon Aurora endpoints</a> .	September 8, 2016
New feature	You can now support the Oracle Enterprise Manager Cloud Control on your Amazon RDS DB instances running Oracle. You can enable the Management Agent on your DB instances, and share data with your Oracle Management Service (OMS). For more information, see <a href="#">Oracle Management Agent for Enterprise Manager Cloud Control (p. 1166)</a> .	September 1, 2016
New feature	This release adds support to get an ARN for a resource. For more information, see <a href="#">Getting an existing ARN (p. 314)</a> .	August 23, 2016
New feature	You can now assign up to 50 tags for each Amazon RDS resource, for managing your resources and tracking costs. For more information, see <a href="#">Tagging Amazon RDS resources (p. 301)</a> .	August 19, 2016
New feature	Amazon RDS now supports the License Included model for Oracle Standard Edition Two. For more information, see <a href="#">Creating an Amazon RDS DB instance (p. 140)</a> .  You can now change the license model of your Amazon RDS DB instances running Microsoft SQL Server and Oracle. For more information, see <a href="#">Licensing Microsoft SQL Server on Amazon RDS (p. 662)</a> and <a href="#">Oracle licensing options (p. 1000)</a> .	August 5, 2016
New feature	You can now use the AWS Management Console to easily move your DB instance to a different VPC, or to a different subnet group in the same VPC. For more information, see <a href="#">Updating the VPC for a DB instance (p. 1772)</a> .  If your DB instance is not in a VPC, you can now use the AWS Management Console to easily move your DB instance into a VPC. For more information, see <a href="#">Moving a DB instance not in a VPC into a VPC (p. 1773)</a> .	August 4, 2016
New feature	Amazon RDS now supports native backup and restore for Microsoft SQL Server databases using full backup files (.bak files). You can now easily migrate SQL Server databases to Amazon RDS, and import and export databases in a single, easily-portable file, using Amazon S3 for storage, and AWS KMS for encryption. For more information, see <a href="#">Importing and exporting SQL Server databases (p. 678)</a> .	July 27, 2016

Change	Description	Date changed
New feature	You can now copy the source files from a MySQL database to an Amazon Simple Storage Service (Amazon S3) bucket, and then restore an Amazon Aurora DB cluster from those files. This option can be considerably faster than migrating data using <code>mysqldump</code> . For more information, see <a href="#">Migrating data from an external MySQL database to an Aurora MySQL DB cluster</a> .	July 20, 2016
New feature	You can now restore an unencrypted Amazon Aurora DB cluster snapshot to create an encrypted Amazon Aurora DB cluster by including an AWS Key Management Service (AWS KMS) encryption key during the restore operation. For more information, see <a href="#">Encrypting Amazon RDS resources</a> .	June 30, 2016
New feature	Amazon RDS for Oracle now includes the April 2016 Oracle Database Patch Set Update (PSU). This PSU adds support for Oracle database engine versions 12.1.0.2.v4, 12.1.0.1.v5, and 11.2.0.4.v8. For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	June 17, 2016
New feature	You can use the Oracle Repository Creation Utility (RCU) to create a repository on Amazon RDS for Oracle. For more information, see <a href="#">Using the Oracle Repository Creation Utility on Amazon RDS for Oracle (p. 1249)</a> .	June 17, 2016
New feature	Adds support for PostgreSQL cross-region read replicas. For more information, see <a href="#">Creating a read replica in a different AWS Region (p. 292)</a> .	June 16, 2016
New feature	You can now use the AWS Management Console to easily add Multi-AZ with Mirroring to a Microsoft SQL Server DB instance. For more information, see <a href="#">Adding Multi-AZ to a Microsoft SQL Server DB instance (p. 706)</a> .	June 9, 2016
New feature	You can now use Multi-AZ Deployments Using SQL Server Mirroring in the following additional regions: Asia Pacific (Sydney), Asia Pacific (Tokyo), and South America (Sao Paulo). For more information, see <a href="#">Multi-AZ deployments for Amazon RDS for Microsoft SQL Server (p. 705)</a> .	June 9, 2016
New feature	Updated to support MariaDB version 10.1. For more information, see <a href="#">MariaDB on Amazon RDS (p. 581)</a> .	June 1, 2016
New feature	Updated to support Amazon Aurora cross-region DB clusters that are read replicas. For more information, see <a href="#">Replicating Aurora MySQL DB clusters across AWS Regions</a> .	June 1, 2016
New feature	Enhanced Monitoring is now available for Oracle DB instances. For more information, see <a href="#">Monitoring OS metrics using Enhanced Monitoring (p. 477)</a> and <a href="#">Modifying an Amazon RDS DB instance (p. 251)</a> .	May 27, 2016
New feature	Updated to support manual snapshot sharing for Amazon Aurora DB cluster snapshots. For more information, see <a href="#">Sharing a DB cluster snapshot</a> .	May 18, 2016

Change	Description	Date changed
New feature	You can now use the MariaDB Audit Plugin to log database activity on MariaDB and MySQL database instances. For more information, see <a href="#">Options for MariaDB database engine (p. 623)</a> and <a href="#">Options for MySQL DB instances (p. 935)</a> .	April 27, 2016
New feature	In-place, major version upgrades are now available for upgrading from MySQL version 5.6 to version 5.7. For more information, see <a href="#">Upgrading the MySQL DB engine (p. 862)</a> .	April 26, 2016
New feature	Enhanced Monitoring is now available for Microsoft SQL Server DB instances. For more information, see <a href="#">Monitoring OS metrics using Enhanced Monitoring (p. 477)</a> .	April 22, 2016
New feature	Added support for PostgreSQL versions 9.5.2, 9.4.7, and 9.3.12. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> .	April 8, 2016
New feature	Updated to support Oracle database versions 11.2.0.4.v7, 12.1.0.1.v4, and 12.1.0.2.v3 with the January 2016 Oracle Patch Set Updates (PSU). For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	April 1, 2016
New feature	Updated to provide an Amazon Aurora <b>Clusters</b> view in the Amazon RDS console. For more information, see <a href="#">Viewing an Aurora DB cluster</a> .	April 1, 2016
New feature	Updated to support SQL Server Multi-AZ with mirroring in the Asia Pacific (Seoul) region. For more information, see <a href="#">Multi-AZ deployments for Amazon RDS for Microsoft SQL Server (p. 705)</a> .	March 31, 2016
New feature	Updated to support Amazon Aurora Multi-AZ with mirroring in the Asia Pacific (Seoul) region. For more information, see <a href="#">Availability for Amazon Aurora MySQL</a> .	March 31, 2016
New feature	PostgreSQL DB instances have the ability to require connections to use SSL. For more information, see <a href="#">Using SSL with a PostgreSQL DB instance (p. 1551)</a> .	March 25, 2016
New feature	Enhanced Monitoring is now available for PostgreSQL DB instances. For more information, see <a href="#">Monitoring OS metrics using Enhanced Monitoring (p. 477)</a> .	March 25, 2016
New feature	Microsoft SQL Server DB instances can now use Windows Authentication for user authentication. For more information, see <a href="#">Using Windows Authentication with an Amazon RDS for SQL Server DB instance (p. 719)</a> .	March 23, 2016
New feature	Enhanced Monitoring is now available in the Asia Pacific (Seoul) region. For more information, see <a href="#">Monitoring OS metrics using Enhanced Monitoring (p. 477)</a> .	March 16, 2016

Change	Description	Date changed
New feature	You can now customize the order in which Aurora Replicas are promoted to primary instance during a failover. For more information, see <a href="#">Fault tolerance for an Aurora DB cluster</a> .	March 14, 2016
New feature	Updated to support encryption when migrating to an Aurora DB cluster. For more information, see <a href="#">Migrating data to an Aurora DB cluster</a> .	March 2, 2016
New feature	Updated to support local time zone for Aurora DB clusters. For more information, see <a href="#">Local time zone for Aurora DB clusters</a> .	March 1, 2016
New feature	Updated to add support for MySQL version 5.7 for current generation Amazon RDS DB instance classes.	February 22, 2016
New feature	Updated to support <i>db.r3</i> and <i>db.t2</i> DB instance classes in the AWS GovCloud (US-West) region.	February 11, 2016
New feature	Updated to support encrypting copies of DB snapshots and sharing encrypted DB snapshots. For more information, see <a href="#">Copying a snapshot (p. 355)</a> and <a href="#">Sharing a DB snapshot (p. 368)</a> .	February 11, 2016
New feature	Updated to support Amazon Aurora in the Asia Pacific (Sydney) region. For more information, see <a href="#">Availability for Amazon Aurora MySQL</a> .	February 11, 2016
New feature	Updated to support SSL for Oracle DB Instances. For more information, see <a href="#">Encrypting client connections with SSL (p. 1022)</a> .	February 9, 2016
New feature	Updated to support local time zone for MySQL and MariaDB DB instances. For more information, see <a href="#">Local time zone for MySQL DB instances (p. 846)</a> and <a href="#">Local time zone for MariaDB DB instances (p. 594)</a> .	December 21, 2015
New feature	Updated to support Enhanced Monitoring of OS metrics for MySQL and MariaDB instances and Aurora DB clusters. For more information, see <a href="#">Viewing DB instance metrics (p. 414)</a> .	December 18, 2015
New feature	Updated to support Oracle Standard Edition Two with Bring-Your- Own-License licensing. Also added support for Oracle versions 11.2.0.4.v5, 12.1.0.1.v3, and 12.1.0.2.v2. For more information, see <a href="#">Oracle database engine release notes (p. 1257)</a> .	December 14, 2015
New feature	Updated to support <i>db.t2</i> , <i>db.r3</i> , and <i>db.m4</i> DB instance classes for MySQL version 5.5. For more information, see <a href="#">DB instance classes (p. 7)</a> .	December 4, 2015
New feature	Updated to support modifying the database port for an existing DB instance.	December 3, 2015

Change	Description	Date changed
New feature	Updated to support three new extensions for PostgreSQL versions 9.3.10 and 9.4.5 DB instances. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> .	December 1, 2015
New feature	Updated to support PostgreSQL versions 9.3.10 and 9.4.5 DB instances. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> .	November 27, 2015
New feature	Updated to support major version upgrades of the database engine for PostgreSQL instances. For more information, see <a href="#">Upgrading the PostgreSQL DB engine for Amazon RDS (p. 1571)</a> .	November 19, 2015
New feature	Updated to support modifying the public accessibility of an existing DB instance. Updated to support db.m4 standard DB instance classes.	November 11, 2015
New feature	Updated to support manual DB snapshot sharing. For more information, see <a href="#">Sharing a DB snapshot (p. 368)</a> .	October 28, 2015
New feature	Updated to support Microsoft SQL Server 2014 for the Web, Express, and Standard editions.	October 26, 2015
New feature	Updated to support the MySQL-based MariaDB database engine. For more information, see <a href="#">MariaDB on Amazon RDS (p. 581)</a> .	October 7, 2015
New feature	Updated to support Amazon Aurora in the Asia Pacific (Tokyo) region. For more information, see <a href="#">Availability for Amazon Aurora MySQL</a> .	October 7, 2015
New feature	Updated to support db.t2 burst-capable DB instance classes for all DB engines and the addition of the db.t2.large DB instance class. For more information, see <a href="#">DB instance classes (p. 7)</a> .	September 25, 2015
New feature	Updated to support Oracle DB instances on R3 and T2 DB instance classes. For more information, see <a href="#">DB instance classes (p. 7)</a> .	August 5, 2015
New feature	Updated to support PostgreSQL versions 9.4.4 and 9.3.9. For more information, see <a href="#">Supported PostgreSQL database versions (p. 1499)</a> .	July 30, 2015
New feature	Microsoft SQL Server Enterprise Edition is now available with the License Included service model. For more information, see <a href="#">Licensing Microsoft SQL Server on Amazon RDS (p. 662)</a> .	July 29, 2015
New feature	Amazon Aurora has officially released. The Amazon Aurora DB engine supports multiple DB instances in a DB cluster. For detailed information, see <a href="#">What is Amazon Aurora?</a> .	July 27, 2015
New feature	Updated to support copying tags to DB snapshots.	July 20, 2015

Change	Description	Date changed
New feature	Updated to support Oracle Database 12c Release 1 (12.1.0.2), including the In-Memory option, Oracle Database 11g April PSU patches, and improved integration with AWS CloudHSM.	July 20, 2015
New feature	Updated to support increases in storage size for all DB engines and an increase in Provisioned IOPS for SQL Server.	June 18, 2015
New feature	Updated options for reserved DB instances.	June 15, 2015
New feature	Updated to support Oracle Database 12c.	April 2, 2015
New feature	Updated to support PostgreSQL versions 9.3.6 and 9.4.1.	March 18, 2015
New feature	Updated to support using Amazon CloudHSM with Oracle DB instances using TDE.	January 8, 2015
New feature	Updated to support encrypting data at rest and new API version 2014-10-31.	January 6, 2015
New feature	Updated to support version 11.2.0.4.v3 of Oracle Database 11g, which includes the PSU released in October 2014.	November 20, 2014
New feature	Updated to include the new Amazon DB engine: Aurora. The Amazon Aurora DB engine supports multiple DB instances in a DB cluster. Amazon Aurora is currently in preview release and is subject to change. For detailed information, see <a href="#">What is Amazon Aurora?</a> .	November 12, 2014
New feature	Updated to support PostgreSQL read replicas.	November 10, 2014
New features	Updated to support version 11.2.0.4v2 of Oracle Database 11g.	October 16, 2014
New API and features	Updated to support the GP2 storage type and new API version 2014-09-01. Updated to support the ability to copy an existing option or parameter group to create a new option or parameter group.	October 7, 2014
New feature	Updated to support InnoDB Cache Warming for DB instances running MySQL version 5.6.19 and later.	September 3, 2014
New feature	Updated to support SSL certificate verification when connecting to MySQL version 5.6, SQL Server, and PostgreSQL database engines.	August 5, 2014
New feature	Updated to support the db.t2 burst-capable DB instance classes.	August 4, 2014
New feature	Updated to support the db.r3 memory-optimized DB instance classes for use with the MySQL (version 5.6), SQL Server, and PostgreSQL database engines.	May 28, 2014
New feature	Updated to support SQL Server Multi-AZ deployments using SQL Server Mirroring.	May 19, 2014

Change	Description	Date changed
New feature	Updated to support upgrades from MySQL version 5.5 to version 5.6.	April 23, 2014
New feature	Updated to support Oracle Database 11g (11.2.0.4).	April 23, 2014
New feature	Updated to support Oracle GoldenGate.	April 3, 2014
New feature	Updated to support the M3 DB instance classes.	February 20, 2014
New feature	Updated to support the Oracle Timezone option.	January 13, 2014
New feature	Updated to support replication between MySQL DB instances in different regions.	November 26, 2013
New feature	Updated to support the PostgreSQL DB engine.	November 14, 2013
New feature	Updated to support SQL Server transparent data encryption (TDE).	November 7, 2013
New API and new feature	Updated to support cross region DB snapshot copies; new API version, 2013-09-09.	October 31, 2013
New features	Updated to support Oracle Statspack.	September 26, 2013
New features	Updated to support using replication to import or export data between instances of MySQL running in Amazon RDS and instances of MySQL running on-premises or on Amazon EC2.	September 5, 2013
New features	Updated to support the db.cr1.8xlarge DB instance class for MySQL 5.6.	September 4, 2013
New feature	Updated to support replication of read replicas.	August 28, 2013
New feature	Updated to support parallel read replica creation.	July 22, 2013
New feature	Updated to support fine-grained permissions and tagging for all Amazon RDS resources.	July 8, 2013
New feature	Updated to support MySQL 5.6 for new instances, including support for the MySQL 5.6 memcached interface and binary log access.	July 1, 2013
New feature	Updated to support major version upgrades from MySQL 5.1 to MySQL 5.5.	June 20, 2013
New feature	Updated DB parameter groups to allow expressions for parameter values.	June 20, 2013
New API and new feature	Updated to support read replica status; new API version, 2013-05-15.	May 23, 2013
New features	Updated to support Oracle Advanced Security features for native network encryption and Oracle Transparent Data Encryption.	April 18, 2013
New features	Updated to support major version upgrades for SQL Server and additional functionality for Provisioned IOPS.	March 13, 2013

Change	Description	Date changed
New feature	Updated to support VPC By Default for RDS.	March 11, 2013
New API and feature	Updated to support log access; new API version 2013-02-12	March 4, 2013
New feature	Updated to support RDS event notification subscriptions.	February 4, 2013
New API and feature	Updated to support DB instance renaming and the migration of DB security group members in a VPC to a VPC security group.	January 14, 2013
New feature	Updated for AWS GovCloud (US-West) support.	December 17, 2012
New feature	Updated to support m1.medium and m1.xlarge DB Instance classes.	November 6, 2012
New feature	Updated to support read replica promotion.	October 11, 2012
New feature	Updated to support SSL in Microsoft SQL Server DB Instances.	October 10, 2012
New feature	Updated to support Oracle micro DB Instances.	September 27, 2012
New feature	Updated to support SQL Server 2012.	September 26, 2012
New API and feature	Updated to support provisioned IOPS. API version 2012-09-17.	September 25, 2012
New features	Updated for SQL Server support for DB Instances in VPC and Oracle support for Data Pump.	September 13, 2012
New feature	Updated for support for SQL Server Agent.	August 22, 2012
New feature	Updated for support for tagging of DB Instances.	August 21, 2012
New features	Updated for support for Oracle APEX and XML DB, Oracle time zones, and Oracle DB Instances in a VPC.	August 16, 2012
New features	Updated for support for SQL Server Database Engine Tuning Advisor and Oracle DB Instances in VPC.	July 18, 2012
New feature	Updated for support for option groups and first option, Oracle Enterprise Manager Database Control.	May 29, 2012
New feature	Updated for support for read replicas in Amazon Virtual Private Cloud.	May 17, 2012
New feature	Updated for Microsoft SQL Server support.	May 8, 2012
New features	Updated for support for forced failover, Multi-AZ deployment of Oracle DB Instances, and nondefault character sets for Oracle DB Instances.	May 2, 2012
New feature	Updated for Amazon Virtual Private Cloud (VPC) Support.	February 13, 2012
Updated content	Updated for new Reserved Instance types.	December 19, 2011
New feature	Updated for Oracle engine support.	May 23, 2011
Updated content	Console updates.	May 13, 2011

Change	Description	Date changed
Updated content	Edited content for shortened backup and maintenance windows.	February 28, 2011
New feature	Added support for MySQL 5.5.	January 31, 2011
New feature	Added support for read replicas.	October 4, 2010
New feature	Added support for AWS Identity and Access Management (IAM).	September 2, 2010
New feature	Added DB Engine Version Management.	August 16, 2010
New feature	Added Reserved DB Instances.	August 16, 2010
New Feature	Amazon RDS now supports SSL connections to your DB Instances.	June 28, 2010
